We asked communities to identify the most significant limitations of their program over the near-term in controlling stormwater runoff. Virtually every respondent cited their inability to document the effects of management practices on water quality. In response to a question on how they would allocate any new federal funds that came to the states, respondents cited the need for demonstration grants assessing technology, BMPs, etc. along with grants to implement local management programs at their top two choices. What is revealing is about these responses is the consistent pattern that communities want more information and support of their efforts to learn about what practices will work in their respective communities. This is a threshold issue regardless of whose resources are being expended. It also amplifies our position that measures to improve urban runoff are not readily apparent or even fully demonstrated.

In the metropolitan Denver area, for example, we sit more than 5,000 feet above sea level. I am certain that EPA staff, its consultants and commentators did not have all of my concerns before them when they were developing the final CZMA guidance document. This committee should expect to hear from communities where local conditions, such as arid and semi-arid regions, would necessitate another look at this guidance and proposed management measures.

As U.S. EPA develops its guidance on the MEP standard, NAFSMA, therefore, recommends that EPA be given the authority and direction to make necessary revisions in the CZMA guidance to make it more effective and workable if it is to be used as a national standard. NAFSMA also echoes the comments of the National League of Cities in requesting that EPA be required to work with state and local governments in developing these CZMA revisions and any additional management requirements under the MEP standard. To ensure that this process is inclusive and can take full advantage of new information, U.S. EPA should be given at least three years, not two, in issuing this guidance on the MEP standard.

III. Industrial Facilities

Current regulation define certain facilities owned and operated by local governments as industrial facilities. Under existing regulations, local governments with large or medium separate stormwater systems must submit separate applications for NPDES permits for all designated "industrial facilities" that they own or operate, while at the same time they must apply for systemwide permits. NAFSMA recommends that the committee provide a process allowing local governments, at their discretion, to include stormwater discharges from municipal facilities in their systemwide NPDES permit.

This is also interest among jurisdictions in having local agencies provide additional regulatory support to the efforts to control discharges associated with industrial facilities, recognizing that these functions are now properly assigned to state and federal permit and compliance personnel. NAFSMA supports changes in current law to allow, but not require under any circumstances, federal and state agencies to transfer regulatory responsibilities to municipal permittees for "industrial facilities" within their service areas. Under S. 1114, construction sites of 1-5 acres and gas stations would be required to seek an industrial permit if the municipal permittee chooses not to regulate these sources. NAFSMA supports this approach to regulating industrial sources.

IV. EPA/State Research and Technical Assistance Capabilities

The provisions of S. 1114 directing the Administrator to undertake a biennial report to Congress on national sources controls and authorizing the Administrator to take steps to control the introduction of such contaminants into municipal stormwater systems are an important step forward in defining a continuing federal policy role in support of local stormwater program efforts. All communities are expected to rely on source controls and other pollution prevention measures as the defining elements of their local programs. What is now evident in the debate over the 1987 Act amendments, and to be remedied by S. 1114, is that Congress did not provide any role for the federal government in defining and implementing strategies to limit or control the introduction of contaminants to municipal separate stormwater systems. Communities under current law are assigned the entire task of managing stormwater quality even though local governments are severely constrained in their ability to control many of the inputs into their systems. S. 1114 directly enlists U.S. EPA as a partner in helping us prevent the introduction of contaminants, many of which can only be controlled at the federal level.

I have already discussed NAFSMA's recommendation that new provisions be added to S. 1114 to require U.S. EPA to initiate additional efforts to improve the science and research to support the application of appropriate standards to municipal stormwater system permits. I recognize that while proposed revisions of the standards program under S. 1114 anticipate that this work will go forward, we would request that U.S. EPA be specifically directed to address this important area of concern.

NAFSMA and its members also have continuing concerns about the administrative and technical capacity to respond to an expanded municipal stormwater program. S. 1114 would add an estimated 1,000 municipalities and more than 200 counties to the municipal system permit by the end of this decade. These communities will require more assistance and support than the first tier of larger systems. Your final bill should anticipate and direct funding for increased staffing and technical assistance support well in excess of the current levels of support.

NAFSMA, as an organization, has not taken a formal position on funding for communities. The Administration has recommended and S. 1114 proposes further capitalization grants to states for their SRF programs to support a broader range of clean water programs, including stormwater. I should point out that our preliminary survey results show a very strong interest in grants to support demonstration projects on BMPs, related water quality assessments and studies pertaining to mu-

municipal stormwater programs. In our view, the suggestion by the National League of Cities to allow some set-aside of SRF funds allocated to each state to support such demonstration projects, selected research and studies makes sense and would enhance the knowledge and practical execution of measures in support of municipal stormwater programs. Our preliminary survey responses indicate very little interest in loans for local programs, reflecting the fact that municipal stormwater programs are operating programs and are funded on a "pay as you go" basis. Communities will not use debt financing to support these program activities.

Status Report on Municipal Stormwater Program

The Water Quality Act of 1987 established an approach for the permitting of municipal stormwater discharges for the nation's larger cities and counties that is now fully in place and moving forward on the schedule set forth in U.S. EPA's November 1990 regulations. Approximately 200 communities serving a substantial portion of urban America have already filed applications for systemwide National Pollutant Discharge Elimination System (NPDES) permits, representing a major milestone in what will be a long term effort to address urban stormwater runoff.

Mr. Chairman, I am pleased to report that these larger communities have been both timely and earnest in responding to this federal directive. More importantly, despite considerable uncertainty, continuing local resource constraints and the revenue effects of a lingering recession, the initial commitment of local resources has been substantial. Total permit application costs, according to a 1992 NAFSMA survey of cities and counties to be permitted, are estimated at \$130—\$140 million. This survey also points out that the costs of permit applications are much higher than this estimate when the jurisdictions with early permits and the smaller communities that joined with larger, listed jurisdictions in areawide or joint applications, are included. NAFSMA is now conducting a follow-up survey of these same jurisdictions to secure final application cost data and to generate a nationwide view of the program as communities secure their initial permits.

Mr. Chairman, a legislator who shaped the 1987 requirements for municipal systems emphasized that the permits for municipal separate stormwater systems would not be permits in the traditional sense but were to be "programs." We strongly agree with this view and would add that the programs and measures that municipalities must develop to control pollutants conveyed by municipal systems are new programs and unfortunately at this time, we do not know how to measure their performance or effectiveness. In short, the nation's larger cities and counties are now charting the course, using the NPDES permit program as the means into the complex issues of non-point pollution, specifically urban stormwater runoff. We are at the front of the line in discovering the level to which our citizens and institutions are willing to make the required adjustments in the way we live and work. The irony of this circumstance is that, in spite of this massive local effort, there is little known about the ultimate effectiveness of this endeavor.

The success of this effort over the near term will depend on the creativity and consensus-building of our local communities, supported by our technical and elected leadership, and their ability to direct massive new financial resources into stormwater systems. Over the longer-term, the level of support and commitment that you and others at the federal and state levels provide will be a critical determining factor in achieving the most significant improvements in the nation's stormwater quality.

Our experiences have shown what we believe is the most significant deficiency in the design of this federal initiative directing larger communities to seek permits for their stormwater systems. The municipal stormwater provisions have created an expectation that now pervades the system that these are our pipes and therefore our pollutants. The 1987 Act did not set forth a parallel agenda for the federal government and/or the states to begin reviewing actions and measures to support a broad-based reduction in the sources and availability of pollutants that find their way into municipal storm drains. In short, if this is a national problem, we see little evidence of any federal and state leadership backing our efforts. S. 1114 through its provisions on national source controls is moving federal policy in a direction that supports our efforts.

This initiative is particularly important in light of the results of more advanced local programs that are now documenting the contributions of the automobile, impacts of air pollution, and a vast array of household and commercial chemical uses. In short, Mr. Chairman, we know treatment facilities will not work and we know that controlling the sources is what this program must be about. We need a higher level of national leadership that places the federal government, in its policies and actions, on a course to do its part. In many areas, you are the only level of govern-

ment that can effectively help us control what passes through our stormwater systems.

NAFSMA POSITION

NAFSMA's key principles setting forth the organization's position on future legislative proposals on municipal stormwater systems are as follows.

I. Point vs. Non-Point Sources

There is a need to emphasize more definitively in the Act that municipal stormwater systems convey, not create, pollutants, that are generated by many different sources. As such, municipal separate stormwater systems are more like non-point pollution sources than traditional point sources. The matter of placement of municipal stormwater in Section 402 in the Clean Water Act reinforces inappropriate and unworkable linkages to other CWA requirements developed for point sources that over time may be extended to municipal separate stormwater system permits, rather than emphasizing the non-point nature of this problem and the appropriate control measures (i.e. management practices).

Short of massive engineering solutions involving costly detention and treatment of municipal stormwater to comparable levels for point sources, the remedies for pollution carried by municipal stormwater systems will rely on programs for source control, pollution prevention, improved public and private management practices, education and the like. These activities represent the most appropriate and cost-effective methods of addressing municipal stormwater discharges for the foreseeable future. Such measures are similarly applied in addressing non-point pollution problems that are currently supported under Clean Water Act programs.

Position: New amendments should redefine municipal stormwater permit requirements, separating this category of NPDES permits from current law linkages and requirements for NPDES-permitted point sources.

Moreover, establishing municipal stormwater as a distinct category of the NPDES permit program does not preclude or limit the implementation of appropriate water quality standards (WQS) to protect beneficial uses.

II. Water Quality Standards (WQS) & Maximum Extent Practicable (MEP) Standard

NAFSMA members rightly assert that compliance with all existing WQS in every storm event cannot be achieved in the municipal program. Clarification of water quality standards and objectives as applied to municipal stormwater is needed to account for the substantial geographic variability and differences between municipal separate stormwater systems and traditional waste water and industrial effluent sources.

Existing NPDES permit application requirements for municipal systemwide permits provide permittees and permit-writers with an opportunity to develop locally- and regionally-specific permit requirements under the Maximum Extent Practicable (MEP) standard to address water quality problems attributable to municipal stormwater discharges. New Clean Water Act amendments further defining MEP should account for substantial progress, including level of effort, local expenditures and assessments of local stormwater impacts which have been or will be achieved under current law and regulations. In addition, such CWA amendment proposals should recognize that permit applications, the resulting permits and compliance efforts will further define and implement the MEP standard.

Position: NAFSMA members intend to move forward with reasonable and fiscally sound programs, including best management practices and other pollution prevention measures, to address urban stormwater impacts on receiving waters.

NAFSMA urges adoption of a longer-term federal strategy to develop new water quality objectives for municipal stormwater runoff that are appropriate to identified water quality impacts on designated uses, properly account for urban stormwater and are technologically-achievable and financially responsible. Existing water quality standards can be used in the interim to measure progress of municipal stormwater permits and programs, while compliance under the Maximum Extent Practicable (MEP) standard is measured by performance of the practices specified in the permits.

III. Industrial Facilities

Under existing regulations, local governments with large separate stormwater systems must submit separate applications for NPDES stormwater permits for all designated "industrial" facilities that they own or operate, while at the same time they must also apply for systemwide NPDES permits.

There is interest among some municipalities and regulators in having local agencies provide additional regulatory support to the efforts to control discharges associated with industrial facilities, recognizing that these functions are now properly assigned to state and federal permit and compliance personnel.

Position: NAFSMA supports legislative or regulatory changes to provide a process allowing a local government, at its discretion, to include stormwater discharges for municipal facilities (current regulations defined certain facilities owned or operated by the local government as industrial facilities) in its systemwide NPDES permit.

In addition, NAFSMA supports changes in current law to *allow, but not require under any circumstances*, federal and state agencies to transfer regulatory responsibilities to municipal permittees for "industrial facilities" within their service areas.

IV. EPA/State Research and Technical Assistance Capabilities

NAFSMA is concerned about the lack of technical and outreach capacity to assist municipal applicants in designing and implementing cost-effective programs and measures to address municipal stormwater discharges. For example, during the application preparation phase of this program, regulations requiring monitoring programs were not well conceived and have resulted in substantial local expenditures for results of limited value to the regulatory agencies and local agencies.

NAFSMA believes that resources are needed to strengthen the technical and programmatic capabilities of EPA and the states to help ensure timely and cost-effective implementation of control measures by regulated municipal systems.

NAFSMA is also concerned that the limited resources now allocated to federal and state agencies for research, technical assistance and other related information exchange functions cannot adequately support an expanding municipal stormwater program in all of the hydrologic regions of the country. Moreover, even the basic information dissemination efforts (e.g. copying and mailing documents, development of case studies to disseminate information on local programs, etc.) are very limited.

Position: NAFSMA supports the establishment of a separate authorization to fund new studies, pilot grants to communities, direct technical assistance to communities, clearinghouse and database functions for information-sharing, further research and effective technical development activities in cooperation with state and local governments in similar geographic/hydrologic regions.

V. Smaller Communities and Other Phase II Sources

NAFSMA believes that we are not ready to proceed with an expansion of the stormwater program beyond the sources that are presently subject to permit requirements. Current law authorizes U.S. EPA and the states to require NPDES permits for Phase II sources where water quality problems exist. This authority has already been exercised on numerous occasions, to address discharges from Phase II sources, such as smaller communities and currently unregulated industries.

As representatives of many of the communities already subject to municipal permit requirements, we feel it is crucial that we gain more experience and knowledge before we move forward with an expanded program. This Committee is urged to pursue a full discussion with U.S. EPA and state administrators on the implications of moving forward at this time beyond the Phase I sources.

Position: NAFSMA supports a deferral of further regulation of the Phase II sources (except in individual cases where federal and/or state administrators require a permit under existing law) until such time as the federal and state regulatory systems are capable of assuming this substantial responsibility and can develop regulatory requirements based on the experiences of the Phase I program.

Conclusion

First, the primary concern of NAFSMA members is that water quality-based limits, including numeric effluent limitations, should not be used in the municipal stormwater permit program to measure permit compliance. Instead, compliance should be based on permittee performance of the practices specified in the permits. S. 1114 addresses this major concern by imposing a ten-year moratorium on numeric effluent limitations and the direct application of water quality standards. However, it is essential that this ten-year period be used to advance urban runoff science to allow the development of appropriate standards for wet weather conditions.

Second, the CZMA guidance document was developed for coastal areas. This document needs to be reviewed and further modified before it can be properly applied nationwide.

Third, a significant effort is already underway by the some 200 larger cities and counties and an estimated 400 other jurisdictions to reduce the pollution carried by municipal separate stormwater systems. As an indication of the level of effort, over \$130 million was spent by the 200 larger cities and counties to prepare applications. Preliminary indications from a recent NAFSMA survey shows that many of these permittees are projecting to spend at least ten times the amount of their application costs during the first five years of their permit. Overall investment in municipal stormwater program efforts will increase significantly as more communities are brought into the program.

Fourth, we urge that federal government and states to commit the political, financial and technical resources to adequately support local efforts. Local governments alone will not be able to achieve the results we are all seeking, nor will local governments believe that Congress is really serious about this problem if adequate federal and state support is not provided.

There are other issues in the legislation that are now under review by our members. NAFSMA will report to you and your staff providing additional recommendations as you develop your final legislation.

Mr. Chairman, I thank the Subcommittee for this opportunity to share the views of NAFSMA on the Clean Water Act reauthorization.

STATEMENT BY THE ASSOCIATION OF STATE AND INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS (ASIWPCA)

We are, Mr. Chairman, pleased to submit our statement for the record. As you know, the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) is the national organization of state officials who on a daily basis implement the Clean Water Act. Mr. Chairman, the states appreciate your personal leadership in the Clean Water arena and we are delighted that you are conducting this series of hearings on reauthorization.

Since 1972, states have made tremendous strides in cleaning up and protecting the environment. Water quality improvements have been well documented by both ASIWPCA and by USEPA. Not surprisingly, with the point source focus of the past two decades, it is now appropriate for States to expand and enhance their programs to address nonpoint sources (NPS). Recent ASIWPCA reports indicate that NPS now represent the majority of remaining water quality problems in the nation's lakes, streams, harbors, bays, coastal waters and groundwater due to current activities, natural conditions and past practices. Under the 1987 Water Quality Act, States placed high priority on NPS control and gained considerable experience confronting many of these serious problems. While the 1987 Water Quality Act represented a starting point for the national program, it is now time to move ahead from the demonstration phase to implementation.

States applaud S. 1114 for recognizing the importance of NPS in the nation's clean water efforts and we have some suggestions that are intended to enhance the Senate provisions. Our comments and recommendations are based on, the following principles:

- The Clean Water Act must strengthen State efforts by assisting them in building permanent programs. Under the 1987 Act's demonstration program, States could not count on a stable national commitment. The Clean Water Act should assist States and Local governments in developing the right institutional structures for long-term NPS management
- The Clean Water Act should support and complement ongoing State programs, with flexibility to continue and expand those efforts. It should not prescribe a particular approach to be used, because that would slow down State efforts. *Command and control for the too down will not work*—there is too much diversity among the pervasive NPS and other factors.
- The Clean Water Act needs to provide an improved national framework with:
 - Established national goals and schedules,
 - A clarified definition of NPS,
 - Improved USEPA guidance,
 - Progressive water quality based management in targeted watersheds and
 - Pollution prevention for new sources.
- Mandates, milestones and deadlines for NPS control must be realistic. It has taken 20 years to come this far in the point source arena—we can not expect the NPS program to be an overnight success. NPS control must be viewed as a *long-term* task comparable to point source control, but requiring a substantially higher level of intergovernmental coordination and cooperation.

- NPS control can best be achieved through a "package" of voluntary and mandatory approaches. While the latter may be needed for specific NPS categories, the most effective approaches rely on a combination of incentives, technical/educational assistance, enforcement, etc. States need flexibility to determine the appropriate balance to accomplish Clean Water goals.
- Targeted and focused efforts are essential. NPS are ubiquitous. Severely constrained staff and financial resources must be used as efficiently and effectively as possible to maximize water quality results within a reasonable time frame.
- Water quality monitoring is a vital component of an effective NPS control program to identify impaired waters, further develop cause and effect relationships between sources and water quality impairments and measure the success of management measures. This too takes time.
- Significant improvements must be made in the basic science of NPS control—there is *a great deal we do not know* that inhibits progress. NPS control needs to be better related to water quality needs, particularly regarding appropriate water quality standards and determining best management practices (BMP) effectiveness.
- Federal agencies need to comply with State NPS management plans. The Federal government must be required to practice what it preaches. Not only are they a major part of the problem, they can also be a key to the solution. The Federal government should be leaders in demonstrating proper management.
- Adequate Federal 319 funding, covering all aspects of the program, is essential to achieve water quality goals in a timely manner.

ASIWPCA COMMENTS AND RECOMMENDATIONS

I. IMPROVING THE NATIONAL FRAMEWORK

ASIWPCA supports an improved national framework for NPS control that includes:

- Establishing a national goal to control existing and new NPS,
- Developing additional national guidance to evaluate State programs, and
- Revising State NPS management programs to incorporate an adequate level of watershed planning, BMP design, water quality monitoring and assessment of progress.

A. *National Program Guidance*—ASIWPCA agrees with S. 1114 calling for USEPA to develop *guidance to be used in evaluating State NPS programs*. Consistent with the bill, this guidance should include:

- *A description of the NPS categories and subcategories,*
- *Program implementation criteria* appropriate for use in evaluating State programs,
- *Methods to estimate reductions in pollutant loads* necessary to protect water quality and achieve the goals and requirements of the Act,
- *Evidence of necessary local government authority and involvement* and
- *Recognition of critical habitats and ecosystems.*

Phasing: In addition, the Clean Water Act should more clearly emphasize the need to *progressively move towards controlling existing NPS through implementing water quality based BMPs in targeted watersheds*, consistent with the intent of the proposed Section § 321 on Comprehensive Watershed Management, but not as prescriptively as recommended for 319 in S. 1114. New sources and existing sources outside targeted watersheds are best handled initially through technology based BMPs.

Deadline: While ASIWPCA agrees that USEPA guidance should be developed as soon as practicable, 90 days is not sufficient to prepare a quality document or provide adequate State input. A short time period will only encourage premature adoption of the untested § 6217 Coastal Zone Act Reauthorization Amendments (CZARA) guidance.

B. *Revised State Management Programs*—ASIWPCA supports the need for each State to revise their NPS management program, consistent with USEPA guidance to:

- Adequately describe *their phased management strategy* for existing and new NPS,
- *Identify all targeted or priority watersheds,*
- *Establish a schedule* for starting implementation projects in targeted or priority watersheds within a time period identified in the Clean Water Act,
- *Establish a process* for determining NPS pollutant load reductions, critical sites and BMPs for targeted watersheds,

- *Establish schedules* which identify milestones to measure progress and
- *Identify a strategy to monitor accomplishments* of the NPS management program, as part of a comprehensive water quality monitoring program.

II. IMPLEMENTATION SCHEDULES

ASIWPCA does not support the 5 year implementation schedule called for in S. 1114. Although it may be possible to *establish State programs* to deal with new sources within 3 years of program approval, *it is unreasonable to anticipate controlling existing NPS* in such a short time. Any effort to implement for all critical NPS within 5 years will overwhelm all program delivery systems, to the detriment of the goal. As stated earlier, NPS control will be a long term mission. State experience indicates that the task is much greater than S. 1114 envisions.

For example, Wisconsin's NPS program is recognized as a leader and has substantial amounts of State funding being provided. The State has been implementing a watershed based NPS program since 1978. More than *15 years* of effort illustrate the order of magnitude needed and the time period required to effectively control NPS. Even with substantial efforts, Wisconsin is able to control only a relatively small portion of their critical NPS. The delivery systems are incapable of going much faster.

- 60 priority watershed projects have been initiated, addressing about one-third of the State watersheds with lakes and streams impaired or threatened by NPS. These projects involve thousands of farms and tens of thousands of needed BMPs.
- To date, over \$50 Million in State funds have been spent, with a FY 93 budget of \$17 Million
- These funds support the over 120 local staff implementing these watershed projects. Even at that level, Soil Conservation Service (SCS) staff cannot meet watershed needs. Moreover, engineering assistance demands far exceeded what SCS can satisfy.
- Due to such factors, Wisconsin statutes call for completing all watershed projects in 15 years, which is an extremely aggressive but reasonable goal. Despite the continuing and substantial support from its legislature, *Wisconsin's program could not meet the implementation schedule proposed in S. 1114.*

The schedule does recognize the extensive time required to build the support needed to enact strong programs, to implement them and to scientifically evaluate the results in order to make program adjustments. For example, North Carolina:

- Has had an animal waste cost share program for over 8 years, providing \$8 Million annually. In 1990 they decided mandatory BMPs were needed. It took until January 1993 to get the rules in place that will be phased in by 1994 for new sources and 1997 for existing sources. Eight years of concerted effort will be required to do what S. 1114 requires in 3.
- Passed a rule requiring BMPs around water supplies in 1989. Plans to implement those requirements are due in 1993 and actual implementation begins in 1994.

In short, quality programs take time. S. 1114's unreasonably short schedules risk public backlash and programs of inferior quality. The tradeoff is not worth it. States have to be able to prioritize and have time to build and carry out adequate programs. In addition, under S. 1114 there would simply not be enough funds, enough qualified staff in States, Local governments, and the private sector, or enough equipment and pickup trucks to come remotely close to meeting the deadlines.

ASIWPCA Recommendation:

Within 60 months after USEPA approval of revised programs, States should be required to, in a two phase process, evaluate implementation progress and propose reasonable revised implementation schedules as part of their NPS management programs. (See below for details)

III. ENFORCEMENT

Although enforcement should be part of the total approach to control NPS, mandating enforcement for all NPS is premature and may be counterproductive in the long-term. Enforceable approaches to controlling existing NPS are likely to be most successful if they are *coupled with* voluntary efforts and *used after* voluntary efforts have had an opportunity to work. More time is needed for State programs to be established and progress to be assessed.

ASIWPCA Recommendation:

- *Within 48 months of USEPA approval of revised State programs*—require States to evaluate progress in implementing their programs, including meeting water quality standards/designated uses and success of voluntary/incentive implementation mechanisms, etc.
- *Within 12 months of evaluating progress and every five years thereafter*—require States to update their management programs in a manner necessary to adequately deal with causes of water quality impairments or threats. The revised program should address, at a minimum, actions needed to achieve compliance with standards, including mandatory BMP installation, prohibitions on certain land practices and implementation of permits.

Enforcement for new sources should take into account the advantages of dealing with the source at the time of a major investment.

IV. FUNDING

Federal funding needs to be greatly expanded to assist States in implementing NPS management programs in a timely manner. The Clean Water Act amendments should move the national program beyond demonstrations to *full scale implementation* of controls that meet water quality standards in an efficient and effective manner. Since 1987, States have made progress in NPS control and program development. However the rate of progress has been severely limited by a number of factors, particularly inadequate funding.

Congress must recognize the long term commitment of resources needed. At least a 6–8 year period of sustained financial support is needed to build the foundation to achieve the necessary rate of progress.

ASIWPCA Recommendation

Funding should come through a number of vehicles, including Section 319. Although, the State Revolving Loan Fund is a viable source, at present it lacks an adequate institutional mechanism to repay loans. Therefore, Section 319 will continue to have a vital role.

- *Eligibility:* 319 funding assistance should cover all aspects of the revised and approved State nonpoint source management programs.

ASIWPCA Recommendation: Eligibilities under 319 should include the following which may include local program institution and 319 plan updates:

- State level administration,
 - Targeted watershed problem identification,
 - Pollutant load reduction determination,
 - Critical site identification,
 - BMP identification and implementation planning,
 - Technical assistance,
 - Education assistance,
 - Enforcement activities and
 - Financial assistance to install BMPs where needed.
- *Distribution:* To be effective and taken seriously, the program must transcend the demonstration mentality to become a mainline program. The present process of work plan development and review is not manageable at increased funding levels. Funds should be distributed to states—with no set-aside for “beauty contest” competitive projects at USEPA. S. 1114 goes only part way, allocating 50% of the funds by formula. This implies a “208 type” project by project process for the remainder of funds, which historically has not worked well in achieving the Act’s goals.

ASIWPCA Recommendation:

All authorized funds should be allocated to States to carry out activities identified through approved State NPS management programs.

- *Economically Achievable Management Measures:* S. 1114 calls for implementing management measures that must be, by definition, economically achievable. While it is important that BMPs be reasonable, it is unlikely that water quality standards will be met if NPS controls are limited to management measures that are economically achievable without financial assistance. For example, based on USEPA’s Economic Achievability Analysis for implementing § 6217 of the CZARA, costs to control animal waste on dairy farms in many upper midwest and northern States cannot reasonably be born by the farmer without financial assistance. By definition, therefore, in S. 1114, implementing these management measures is not economically achievable.

ASIWPCA Recommendation:

Cost sharing for BMP installation should be available, based on need, even when installation does not meet a test of "economically achievable."

- *Incentive Grants:* While S. 1114 proposes incentive grants to encourage installation of BMPs, the limitations specified (up to 50% of project cost and a limit of \$5,000 per year) make the incentives too low and too restrictive to control many NPS in a practicable and timely manner. More flexibility is needed. For example, based on the experience in Wisconsin's State funded program, animal lot runoff controls cost over \$15,000, while needed manure storage facilities cost \$20,000—or a total of at least \$35,000 per livestock operation. Statewide, the cost to control animal waste sources on 15,000 to 20,000 livestock operations exceeds \$500 million.

ASIWPCA Recommendation:

S. 1114 should give States more flexibility. Given the situation in Wisconsin, Michigan and other upper midwest States alone, a 50% incentive grant or a low interest loan can be insufficient to make BMP's economically achievable. The limit of \$5,000 per year is impracticable when dealing with such costs.

- *Funding Level and Matching Requirements:* Funding is needed commensurate with the program established under S. 1114. Unless refinements are made as recommended above, the proposed authorization will be grossly inadequate.

ASIWPCA Recommendation:

The streamlined program recommended above requires for:

FY 1994-96:\$500 Million annually
For FY 1997-98:\$1 Billion annually

The existing 40% match requirement should be retained. Funds not used by a State or other eligible recipient should be available for redistribution to other States.

SUMMARY

- S. 1114's objective should be to build the State NPS programs needed over time to achieve water quality goals. It *assumes*, instead, that foundation is in place to carryout the BMPS prescribed—when that is not the case. States should be accountable for achieving that objective. USEPA should oversee their program development and support activities through funding, research, technology development/transfer and better standards. Such a partnership can produce more broadly supported programs that achieve water quality goals much faster. In many ways, the bill must "reinvent" historical government relationships.
- States should be responsible for setting priorities and determining with Local governments, etc, cost-effective approaches to improving water quality. S. 1114 "over-Federalizes" by defining and micro-managing activities down to the local level, with an *untested* CZARA approach. Historically, the Federal government has not performed well in such endeavors, whereas State and Local governments can.
- The Clean Water Act should put into place an improved national framework to achieve the above objective, relying on State programs, with iterative water quality based management in targeted watersheds and pollution prevention for new sources.
- NPS control is best achieved through a mix of voluntary, incentive, educational and mandatory approaches. States should evaluate revise/update their NPS programs periodically, including enforcement and other refinements as needed.
- The implementation schedules in S. 1114 should be more reasonable given the nature and extent of the nonpoint sources, intensive multi-agency activities necessary, likely resources and delivery system capabilities.
- The Act should not perpetuate the demonstration program S. 1114 needs to do more to support, instead, implementation of approved State 319 programs. Adequate Federal funding eligibility for all parts of State programs is essential to achieve water quality goals in a timely manner.
- Success depends upon adequate 319 funding (\$500 Million to \$1 Billion annually) and the ability to leverage other Federal programs through consistency requirements.
- S. 1114 needs more adequate incentive grants for BMPS that are not economically achievable without financial assistance.

Mr. Chairman, the States and our Association appreciate the opportunity to present our views on the Nonpoint Source program. We are available at any time to work with you and/or your staff on these key issues. Please contact our Executive Director, Roberta (Robbi) Savage at 202-898-0905, if you wish further details or would like additional State input.

STATEMENT OF THE COASTAL STATES ORGANIZATION, INC.

As a representative organization of the Governors of the 35 coastal States, Commonwealths and Territories of the United States, the Coastal States Organization appreciates the opportunity to submit our comments on the Nonpoint Pollution Control Provisions of the Water Pollution Prevention and Control Act of 1993, S. 1114 to this Subcommittee. Founded in 1970 the Coastal States Organization represents the collective voice of the coastal State Governors on ocean, Great Lakes and coastal affairs. Due to our experience in implementing the coastal nonpoint pollution control program over the last three years, we have an intense organizational interest in the nonpoint pollution control provisions of S. 1114.

The coastal States have been the leaders in addressing the problem of nonpoint source pollution, and recognize the need for a more comprehensive and effective approach than that currently prescribed in § 319 of the Clean Water Act. We believe that S. 1114 makes significant progress towards enhancing the Clean Water Act's nonpoint source pollution control program. At the same time, we believe that several points must be considered.

Keys to a Successful Nonpoint Pollution Control Program

COORDINATION WITH OTHER FEDERAL PROGRAMS: Section 304 of S. 1114 provides for consistency with other federal nonpoint control programs, specifically agricultural and highway construction programs. Conspicuously absent, however, is any mention of the coastal nonpoint pollution control program being implemented under the Coastal Zone Management Act. This program, commonly known as the CZMA § 6217 program, is well underway, and should be coordinated closely with the nonpoint pollution control program under § 319 of the Clean Water Act.

The CZMA § 6217 program statutorily requires States to submit to EPA and NOAA their coastal nonpoint pollution control programs for approval in July 1995. Many States are revising their Clean Water Act § 319 programs as part of this process. Further, program revisions are required under § 6217 if water quality goals are not attained.

The provisions of S. 1114 must recognize these efforts. If S. 1114 is enacted as is, States would be required to revise and submit their programs to EPA *again* in 1996. Care should be taken to avoid placing the States in an endless cycle of plan revision which will be at a cost to plan implementation.

SCIENTIFIC FOUNDATION FOR CONTROLLING NONPOINT SOURCES: The monitoring provisions contained in § 301 of S. 1114 are much needed. However, they should be more focused on providing technical assistance to the States, especially in detecting and quantifying nonpoint source pollution. Identifying the linkage between nonpoint source pollution and land use is often tenuous. Hard data, and the means to acquire it, is needed for effectively controlling nonpoint pollution, especially if regulatory enforcement actions for controlling nonpoint sources are to be sustained in the face of inevitable legal challenges. EPA and NOAA have a wealth of expertise, monitoring and modelling capabilities that are not adequately utilized to meet immediate coastal management needs. States need federal technical assistance to identify nonpoint sources and gauge the success of their control efforts.

FLEXIBILITY THROUGH MULTIPLE APPROACHES: S. 1114 requires States to ensure that management measures be enforceable, much the same as the CZMA § 6217 program. However, S. 1114 contains considerable more flexibility than § 6217. First, it allows for recognition of regional variation in the implementation of management measures. Second, it allows for consideration of the economic capability of the affected land or water user to implement management measures. The flexibility provided in S. 1114 is necessary to obtain the public support crucial to the successful local implementation of this program. The Coastal States Organization supports this flexible approach in S. 1114.

S. 1114 recognizes the need for enforceable requirements where other means have not effectively promoted the adoption of nonpoint source control measures. However, by itself, a regulatory regime for controlling nonpoint source pollution will not work. The resources to patrol the broad and diverse scope of sources of nonpoint

pollution are simply not available. Developing and implementing nonpoint source control programs, as well as monitoring compliance and the effectiveness management measures is very labor intensive.

We strongly recommend that changes to § 319 allow States to prioritize their resources according to the significance of their problems and their ability to address those problems. A graduated, flexible approach for controlling nonpoint sources is needed, one which is tailored to each type of source.

LINKING FEDERAL SUBSIDIES TO RESPONSIBLE LAND USE: S. 1114 takes a "get serious, no more excuses" approach to controlling nonpoint pollution. We could not agree more. To this extent we urge the Committee and Congress to come to grips with the role of leveraging agricultural subsidies to promote measures to control agricultural nonpoint pollution. The solution to the problem of agricultural nonpoint pollution is not to provide more subsidies as incentives not to pollute, but to make the provision of existing subsidies contingent upon responsible agricultural practices. We realize the difficulty Congress faces in trying to address this issue given the split of committee jurisdiction. However, State authority is also split among many State agencies, yet these agencies must be able to come to terms with each other in order to meet federal mandates. There is no reason that the Federal government should not hold itself to the same standard of coordination and cooperation.

PUBLIC SUPPORT: The public must understand the serious problem of nonpoint source pollution and its relationship to land use in order for them to support an effective nonpoint source pollution control program. Public participation in the revision of nonpoint pollution control programs should not be confused with public support. There is no doubt that there will be broad resistance from coalitions of affected users challenging efforts to control nonpoint source pollution. Public support for an enhanced § 319 program envisioned in S. 1114 will only come about through public education, a process which is likely to take many years to accomplish. Building broad public support for the widespread implementation of management measures will take a concerted effort with federal assistance.

ECONOMICALLY PRACTICAL SOLUTIONS: Section 304 of S. 1114 recognizes the need for economically practical solutions of controlling nonpoint sources by authorizing the States, with EPA approval, to adopt alternative requirements with respect to specific sources of nonpoint pollution. In many cases, no single management measure will be effective in controlling a nonpoint source. The assessment of economic capability of implementing management measures must also consider the combined costs of multiple management measures. For these reasons, we support the "economic capability" approach of § 304.

ADEQUATE FINANCIAL SUPPORT: Controlling nonpoint source pollution is expensive, especially for existing sources in urban areas. The costs of controlling some sources of nonpoint pollution may be prohibitive without federal financial support for implementation, monitoring and enforcement. We support the increased authorization of appropriations under this section, but in view of the terribly tight fiscal constraints on the federal government, we continue to be concerned that actual appropriations will remain far below the authorized spending levels.

FEDERAL AGENCY REGULATION OF LOCAL USE: S. 1114 requires EPA to publish regulations to implement enforceable minimum control measures in the event that a State fails to submit a revised nonpoint source pollution control management plan. We must note our concern with this provision because it raises questions about the ability of a federal agency to regulate local land use, an area of the law that has a long-standing tradition of being the primary responsibility of State and local governments. Beyond the legal policy questions, we also question whether EPA, from a practical standpoint, has the capability to enforce the implementation of site specific management measures.

Conclusion

We appreciate the opportunity to submit these general observations to the Subcommittee at this time. The Coastal States Organization is continuing to analyze and review the nonpoint source pollution control provisions of S. 1114, and will be submitting more detailed comments for the record in the near future.

Thank you.

REAUTHORIZATION OF THE CLEAN WATER ACT

TUESDAY, JULY 27, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES, AND WILDLIFE,
Washington, DC.

WATERSHED PLANNING AND MANAGEMENT; MONITORING AND ENFORCEMENT

The committee met, pursuant to notice, at 2:15 p.m., in room 406, Dirksen Senate Office Building, Hon. Bob Graham [chairman of the subcommittee] presiding.

Present: Senators Graham, Durenberger, Faircloth, Chafee, and Lautenberg.

OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Senator GRAHAM. I call the meeting to order.

This is the fifth in a series of hearings on the reauthorization of the Clean Water Act. Today we turn our attention to two issues: watershed planning and enforcement.

Watersheds are the areas that drain into a common outlet such as a river or lake. As early as 900 B.C. the Chinese understood how watersheds work and their importance to human activity. They had a proverb: "To rule the mountain is to rule the river."

Today, most of those who have studied the matter agree that we must control what is discharged into the watershed if we are to clean up rivers, lakes, and streams into which they drain. They believe this is especially true as we try to tackle our largest remaining water quality problem: nonpoint source pollution.

Watershed planning is not a new topic in the Clean Water Act. The 1972 Clean Water Act established a program entitled section 208 of the act that was designed to identify all waste—point and nonpoint—generated in a specific region and to plan for structural and nonstructural means to prevent their discharge. Unfortunately, the 208 process was not a great success, in large part due to limited funding. It has also been criticized because it emphasized planning and provided no financial assistance or incentives to link planning with implementation of nonpoint source control measures.

Despite the failures of this program, many States have taken the lead in watershed planning and we will learn about some of those efforts today in the States of North Carolina and Rhode Island.

An argument often made for watershed planning is one that has been repeatedly made in our previous hearings. People relate to the waters where they live, work, and play. A key goal of watershed planning is to motivate and educate the community as to the causes of pollution of neighboring rivers, lakes, and streams. This is important because our most difficult problem, nonpoint source pollution, is not just an agricultural problem. It affects the way we all live and dispose of substances that rain washes into our lakes and streams.

Human nature tells us that this goal is easier to achieve when the watershed is relatively small. People are simply more likely to alter their lifestyles for the benefit of those downstream if they feel a sense of connection. Thus, the definition of the watershed becomes an important issue.

Those who advocate watershed planning also tend to emphasize its flexibility: its recognition of the fundamental differences between the soil and hydrology of a State like Florida and a State like Colorado. Watershed planning can recognize the difference between a river whose watershed is populated with dairy farms and one that is home to industry or suburbs.

Watershed planning is not without potential problems. Watersheds do not recognize jurisdictional political boundaries, whether they are State lines, counties, or cities. When the time comes to implement a plan, much less develop it, there are many intergovernmental disputes that must be addressed. We will explore these problems today and see how they might be resolved.

We are also likely to hear concerns today about whether Congress should require States to engage in watershed planning and to do so on a State-wide basis. The bill before us takes a more modest approach. It encourages States to plan watersheds and emphasizes those watersheds that are impaired.

Every night the news tells us of the problems we face when watersheds are flooding. Looking at the devastation that is occurring in the midwest from the floods, I am reminded of the lessons we learned at our first hearing about the way rivers draw people to them and how we alter river basins to sustain human activity. While these floods are primarily the result of extraordinary natural occurrences, they also serve as lessons to us on the manner in which we impact rivers and how we plan or fail to plan for the growth near them.

It is with this in mind that I look forward to the discussion today on our first topic.

Our second topic is also important because we know that pollution does occur, despite our best efforts, and we must take action to prevent it when we can. The Clean Water Act provides the EPA and States with many enforcement weapons against polluters. Perhaps as important, the act also empowers citizens to bring civil actions. Many believe that we need to strengthen the enforcement arsenal both for the agencies and for concerned citizens. Our second panel is likely to present us with different perspectives on how we should proceed.

We will conclude our current series of hearings next week with two hearings on August 4th and 5th. We will be holding an additional hearing on wetlands in September.

As can be seen, we are again using an informal format. Because we wish to use this format to facilitate discussion, I will ask our witnesses to very briefly summarize their statement, if they feel that they can do so, and in no event take longer than 5 minutes. Your full written statements will be made a part of the record. At the conclusion of all the statements from each of the two panels, we then look forward to a very constructive interchange of ideas and questions.

Having just made the announcement of brevity, I will now break the rule.

I believe Mr. Tedder has a brief series of slides and his presentation may somewhat exceed 5 minutes. I felt that this was important so that we could put some specificity and tangibility behind the concept of watershed planning. I believe that his remarks will be a useful introduction to the topic.

We are joined by two of our colleagues today, Senator Faircloth and Senator Durenberger.

Do you have an opening statement?

Senator DURENBERGER. None.

**OPENING STATEMENT OF HON. LAUCH FAIRCLOTH, U.S.
SENATOR FROM THE STATE OF NORTH CAROLINA**

Senator FAIRCLOTH. Yes, I do have a very brief one. Thank you, Mr. Chairman.

I would just like to introduce one of our witnesses, Steve Tedder. Steve is from North Carolina and he is chief of the water quality section of the North Carolina Division of Environmental Management. He will be testifying today not only on behalf of North Carolina, but of his colleagues in a similar position around the country.

Steve has been with the North Carolina water quality division for 17 years and has done an excellent job. In fact, North Carolina is the Nation's acknowledged leader in watershed planning. We are way ahead of the game, we are way out front, and we intend to stay there. Steve and his colleagues deserve a great deal of the credit for putting us there.

I thank him for being with us and I look forward to him bringing a real-world common-sense approach to what we are talking about from someone who has been in the business for 17 years and understands how it works.

Steve, thank you for being with us.

Senator GRAHAM. Thank you, Senator. You have just provided a wonderful introduction to one of the members of our first panel, who I will call upon to be the first witness in that panel.

Also, we are joined today by Mr. Blake Anderson, county sanitation district of Orange County, California; Mr. Charles Gauvin, president of Trout Unlimited, Vienna, Virginia; Mr. Curt Spalding, executive director of Save the Bay, Providence, Rhode Island; and Ms. Lorna Stickel, representing the Western Governors Association, based in Denver, Colorado.

I thank each of you for being here today in what I know will be a very constructive discussion.

Mr. Tedder?

STATEMENT OF STEVE TEDDER, CHIEF, WATER QUALITY SECTION, ENVIRONMENTAL MANAGEMENT DIVISION, STATE OF NORTH CAROLINA REPRESENTING THE ASSOCIATION OF STATE AND INTERSTATE WATER POLLUTION CONTROL AGENCIES

Mr. TEDDER. Thank you, Mr. Chairman and members of the committee for this opportunity and this vehicle for my counterparts and myself to address the Clean Water Act and possible changes in the Clean Water Act, especially on the topic that we are going to discuss today on watersheds because this is an extremely critical part of our programs and a critical part of the focus of many of the programs across the country right now.

[Slide presentation.]

Mr. TEDDER. Basin-wide water quality management, as was mentioned earlier, is not new. Many States have already started employing various techniques at various scales. I think it is very encouraging that we are seeing that already and now we are seeing some reflection of that in the Clean Water Act.

As we look at the North Carolina program, on this map you will see 17 basins in the State of North Carolina. We really have adopted a scheme and a method to move forward with 17 individual basin plans at this point. So we have actually taken the approach to include the entire State of North Carolina in our planning process for the basin-wide or watershed approach.

What is the goal? What are we looking for as we develop these 17 individual plans?

We are trying to develop a consistent yet effective long-range plan, something that we can move toward. We have to be cognizant that it is not quick. It is an evolving process that we must acknowledge as we go through this approach. It will not happen overnight.

This allows us to focus efforts and resources, which for the States is extremely critical. We will never have the resources to do all of it at one time, so we have to look for these unique mechanisms to be able to focus those resources, our monitoring, our assessments, and our permitting. For our approach, it is not a new regulatory program. I think that is extremely important. We are dealing with the existing rules, regulations, and statutes that we have to try to more effectively implement those regulations.

It is a way to see the big picture. I think that is extremely important as we work to protect water quality. It is an evolutionary process. The way our system is set up, it will be revisited every 5 years for each basin across the State, for the first time a very good opportunity to integrate both the point source and nonpoint source control efforts into a single plan to address the problems of specific basins.

So we have the framework to address many of the areas that we have not in the past. At the bottom you will see one that is very important, which is to lay out a plan not only from an educational standpoint but to allow the public to participate in the process. We provide this citizen input through public hearings. We have allowed considerable public input through the entire process of the basin-wide.

Why basin-wide? At least in North Carolina—and I know it is the same in every State—watersheds themselves are very different. Therefore, the solutions to the problems are going to be very different in each watershed. We cannot treat them the same. It is an investigative process to find out what the problems are in a particular watershed and what is responsible for those problems.

Yes, it can still be point sources. We have not solved all the problems with point sources. At the same time, in a particular watershed it may be sediment. It may be from an agricultural operation. Or it could be nutrients from the homes and developments. A variety of areas could cause these problems that are going to be very distinct in each basin, in each watershed that we evaluate.

So the causes are very different and those pollutants—those issues of concern—this graph will look extremely different for every watershed that we evaluate and every basin or watershed in any State will look very different from this one. If we look at the nonpoint sources, there are several areas that we have to concentrate. We have to rank and look at and focus our resources. In one basin, it may be agriculture, but yet in another basin it may be forestry. With the planning process it allows us to rank our efforts as to which ones we have to identify and develop new avenues to address problems in those areas.

Those different areas are different also in each basin. The chart will be broken up very differently each time.

It is very interesting that it allows us the ability to focus on problems. In North Carolina, as you will know, it is an agricultural based State. Yes, it has been the sacred cow for many years. This approach has allowed us to work together with the other agencies to focus on the problems, to target certain areas. In North Carolina, we have been targeting certain areas that we need to address either through new rules and regulations or how to use the regulations that are on the books more effectively.

Our point source controls are there. They are very ingrained in the program. It is not new, but we still have problems. We will always have problems that we have to address through our enforcement mechanisms. I think these are very evident. As we address those problems, we have to acknowledge that they are not consistent problems. Those same situations may change on a daily basis. We have to be aware of that and we have to tailor our approaches to meet those demands.

This leads into the enforcement part. This is a very important aspect of are program—and I know you are going to talk about that today. As we have modified certain things, we are seeing improvements. Don't let anybody kid you that improvements are not being made in the environmental programs, because they are. I think this graph displays that very readily. And there are different ways to accomplish this.

As we embarked on the watershed approach, we also looked at different ways of enforcement. I think you can see on this graph in 1990 that there was some type of subtle change in the program to increase our enforcement activities 500 percent with the same staff that we had before. The monitoring is critical. That is the reason that watershed planning takes time.

But is it more efficient? The answer is yes. I think you can see from this graph, which displays—pre and post basin-wide monitoring efforts—the increase in the level of effort that was allowed using the very same level of staff.

As we look at the approach, what is different? One of the things that we have done is to have all the permits in each basin expiring at the same interval. Therefore, we can address those problems and make changes more rapidly. The studies are not scattered, they are focused. Most importantly, there is a plan.

What is the watershed approach? It is everything we think of in a water program combined into one. We need to get away from the fractionalization of the programs and independent way of doing business and pull these into a focused concept, as well as the funds. Let's not treat these as separate. It is a water quality program, and that is how we must work this we are to be successful. Let all those program component, be watershed protection.

We see these issues as the major keys to success. We must eliminate some barriers for sure. We seek consolidation of efforts, whether grants or reporting, as very important to allow the States to move forward without substantial resources for the basin-wide approach. Of all of these, the one that is most important is that one size does not fit all. We must allow that flexibility within the States to work within their resources to make the basin-wide approach work.

I don't think you can mandate success. You have to let success gradually occur, because it will happen. The movement is occurring across the country right now. Let's encourage it. Let's not get in the way of that momentum.

The Clean Water Act, currently encompasses numerous places that already clearly indicates that basin-wide is here. The mechanisms are here. the directions are already in the Clean Water Act. Let's not jeopardize what is there.

Yes, the level of programs and the expectations of each of the programs are increasing drastically. We will never fund all the expectations. Let's look at what is causing the barriers to the States to implement a watershed approach. To more efficiently address these issues I think would be heading the right direction.

As we in North Carolina and the other States across the country move forward with specific basin plans, there is a movement out there of support. It will take time and it will not happen overnight. It will not happen in 3 years, I can assure you, because it takes time to put these together if you are going to have an effective plan.

Look at the keys. It is more efficient; it is more effective; and it is predictable. I think it is important for the regulated community to have some predictability to the process. It allows better resource management and it is politically achievable.

What does it do? It does a lot for the public. It allows us to educate the public, to provide them information on the watersheds in their backyard where they are going to have an interest.

We have to quite juggling the resources. We have to focus the resources if we are going to be successful in our programs. I think a lot of the States have the staffing. We can eliminate the complications and delays if we are thoughtful and careful with the Clean

Water Act reauthorization. I think we can do it with very minimized increased costs. If there are any doubts as to whether it can be successful, the answer from North Carolina is no, there is no doubt. We can be successful in this effort, but we have to look at it from a very holistic measure and look at it from a watershed basis. We think that is very essential to the success of the program.

Thank you, Mr. Chairman.

Senator GRAHAM. Thank you very much, Mr. Tedder. Any presentation that can go from Sherlock Holmes to Miami Vice and end with Planet Earth is wide ranging.

[Laughter.]

Senator GRAHAM. Mr. Anderson?

STATEMENT OF BLAKE ANDERSON, COUNTY SANITATION DISTRICT OF ORANGE COUNTY, CALIFORNIA, REPRESENTING THE ASSOCIATION OF METROPOLITAN SEWERAGE AGENCIES

Mr. ANDERSON. Mr. Chairman, what you will hear from me pretty much parallels what you just heard from Mr. Tedder.

AMSA strongly endorses the concept of comprehensive watershed management. We see it making incredible sense from a local perspective. It gives us the flexibility and the accountability to move toward site-specific solutions to real problems within a watershed. We see it as really where the bold action needs to be taken by the Senate in moving toward a new model for managing water quality into the next century.

We see watershed management as an umbrella under which the existing provisions of the Clean Water Act can operate. It gives us the opportunity to first look at what the resources are within a watershed that need to be protected; second, look at what the sources of pollutants and impacts are; third to look at the alternatives that are available for us to solve the problems; and fourth, it gives us the enforcement provisions that allow us to make sure that promises made are promises kept.

Today, water quality standards are pretty much dictated in a top-down way of looking at things. There are national standards which drive permit conditions, which then drive the facility and construction and operational decisions that drive the programs that are in existence today. At this point, there is really little thought to the environmental and resource response to these activities. Comprehensive watershed management will allow us to look at local conditions, and on that basis develop a management plan. From that management plan we can begin to implement the expenditures of resources to address those issues, and then monitor the effects. Then it feeds back up to the top.

As Mr. Tedder said, it is a long-term iterative process to really understand where the resources are being impacted and what we can best do to effect improvements.

I would like to give a little input on S. 1114. First of all, it does give the governors the ability to voluntarily designate watersheds and create watershed management plans. We endorse the concept, but we believe that it should go farther. We believe that it should not be voluntary, that it should be mandatory. We think that will drive the entire country along on an even basis. It will keep a level

playing field throughout the country and will assure the steady movement toward improved water quality.

S. 1114 gives the governors the ability to designate management entities that send completed plans to EPA for approval. We endorse the concept, but we think you need to go farther. First of all, you need to define who is on the commission, and the commission should include State, Federal, and local government. It should include the major stakeholders, sources of pollutants as well as the people who are using the watershed for all its beneficial uses.

Citizenry and environmental groups all need to be at the table as coequal partners discussing the direction in which the plan is headed, the schedules and time lines that are going to be established, and finally the priorities that the people within the watershed are going to use to make progress toward water quality improvement.

We also think the commissions need to be empowered to make the final decisions. Right now, S. 1114 says that the plan, once completed by the management entity, is passed onto EPA for approval. We believe that EPA should be at the table at the time the plan is being designed and that all the people within the commission make the considered judgment of how the plan should be completed. On that decision, the plan then moves forward. Moving things to some kind of an administrative fiat hundreds of miles away from the point of action will just invite regulatory gridlock. You must have everyone participating in the decision.

One final note is that we really see S. 1114 and comprehensive watershed management as really being an umbrella under which existing mandates are operated. It is really not asking for anything new. It is simply clarifying and streamlining the process that must go forward for improved clean water objectives.

Senator GRAHAM. Thank you very much, Mr. Anderson.

We have been joined by the ranking member of the committee and this subcommittee, Senator Chafee of Rhode Island.

Senator CHAFEE. Thank you, Mr. Chairman.

I am delighted that Mr. Curt Spalding, head of Save the Bay in Rhode Island, our largest environmental organization, is here to testify. I look forward to hearing his testimony and the others likewise.

Senator GRAHAM. Thank you.

Mr. Gauvin?

STATEMENT OF CHARLES GAUVIN, PRESIDENT, TROUT UNLIMITED

Mr. GAUVIN. Thank you, Mr. Chairman.

I would like to say that I am glad to be here. On a personal note, it is the first time I have ever testified before Senator Chafee. I am a former constituent of his and used to work with Save the Bay, which is the organization that Mr. Spalding heads, back in the days when the Providence sewage treatment plant was putting into the bay what we euphemistically called "grease balls". That situation has been cleaned up.

I am very happy to have a chance to give you Trout Unlimited's—

Senator CHAFEE. Mr. Gauvin, nothing breaks a politician's heart more than to hear that an admiring individual turns out to be a former—

[Laughter.]

Mr. GAUVIN. Thank you, Senator.

I am pleased to present Trout Unlimited's views on this very important piece of legislation. I would like to say that our biggest concern with the triad of objectives in the Clean Water Act—namely, the restoration and maintenance of the chemical, physical, and biological integrity of the Nation's waters—really has to do with the biological integrity. The problem that we see around the country with cold water—namely, Salmon and Trout habitat—is that you have, despite the appearance of attainment status with water quality standards, you have more and more extirpations of local populations and genetically distinct stocks of fish, which causes us great concern.

This situation collectively I have chosen to call a biological deficit. When I use that term I refer to situations such as the scores of Pacific Salmon stocks that are in jeopardy of extinction throughout their range, such as the stocks and populations of other native Salmon in the inter-mountain west which are endangered or threatened and to summarize the overall situation, which involves a third of all our native freshwater species that are threatened or endangered and a fifth of all our aquatic species that are now threatened.

This, to me and to our organization and to other conservationists, is a potential loss of unprecedented and unconscionable biological, economic, social, and cultural dimensions. It is a great potential loss of biological diversity. Needless to say, our aquatic habitats, our economic life, our social life, and our cultural life will be greatly affected by it if it is to occur.

So much of this loss has to do with habitat degradation and so much of that has to do with the conditions of our watersheds. I think S. 1114 is an important step in the right direction. I think there is much in the bill that could be used to protect our watersheds and to make life a little bit better for some of our native and wild Trout, Salmon, and other fish species.

I would like to give you some specifics as to how I think the bill could be improved. In section 301 of the bill, the basic introductory and fundamental planning section of the bill, it seems to me that if you have—if the term biological integrity in the act is to mean anything, then we have to protect species diversity. We have to protect the species diversity that is in healthy habitat and we have to ensure that unhealthy habitat is restored and that it regains species diversity.

In many cases, that won't occur, even if the habitat in question meets current water quality or future sediment standards. We have to look at biological monitoring, biological assessment, we have to monitor for those conditions, and we have to incorporate those standards in the planning and other guidance mechanisms of the act.

In addition, when you are talking about a balance of indigenous populations of fish, shellfish, and wildlife, again the important thing is diversity. It is at least as important as balance. Unhealthy

habitat and a depressed condition will achieve its own balance, but it is not biologically healthy. In order to be so, it must be diverse.

As far as the monitoring provisions of section 301, I would like to suggest that monitoring capture the effects of nonpoint and other pollutants on all sediments, in the water column, and on all significant populations of aquatic biota. I would like to see that biota provision added in the monitoring provisions of the bill.

I would also like to suggest that really no watershed planning and assessment is adequate unless you also look at the problem of in-stream flows. In know in-stream flows—the jurisdictional situation under the Clean Water Act is extremely qualified, but for planning purposes and assessment purposes, we really ought to be looking at in-stream flow issues whether hydropower projects or other kinds of diversions—dams and other diversions are at least as big killers of fish as the things we normally consider pollutants.

Finally, we would like to call upon the committee to consider requiring uniform attainment status so that we no longer have a situation in which some States water is in attainment at a particular standard or partial attainment and in other States—or even within the State—you have other waters that are not so in attainment.

Finally, I would like to suggest that with respect to the other component of the bill, the thing that really makes the bill work, the nonpoint area of the bill, that there is some room for improvement. Again, I think biological integrity of the water has to be the focal point of nonpoint source regulation. I think you need to avoid incorporating a position that will not result in the weakening of point source regulation as we move forward, all on the mistaken assumption that existing waste load allocations accurately capture either the existing nonpoint sources or the new point source loadings of pollutants.

In this connection, I would like to comment to your attention Representative Oberstar's bill on nonpoint which seems to me to do the job a little bit more forcefully and in a more biologically sound direction than S. 1114.

We at Trout Unlimited have some experience with watershed protection and restoration. A good example is our recent to protect and restore Norman McLean's beloved Big Blackfoot River in Montana.

I think the bill before the committee is directionally correct, sound in many respects, but it still needs to be strengthened to yield effective watershed protection and restoration.

Thank you.

Senator GRAHAM. Thank you very much.

Mr. Spalding?

STATEMENT OF CURT SPALDING, EXECUTIVE DIRECTOR, SAVE THE BAY, PROVIDENCE, RHODE ISLAND

Mr. SPALDING. Thank you very much, Mr. Chairman. And thank you to the committee for allowing me the opportunity to come all the way from Providence, Rhode Island to testify.

Some of you may be wondering, Save what bay? For those in the audience who haven't been to Rhode Island, it is Narragansett Bay.

Save the Bay represents 15,000 members and we are dedicated to a clean and healthy Narragansett Bay that people enjoy.

We have been around for 23 years. During that period, we have had extensive experience with strategic environmental planning. In effect, watershed planning is another version of that initiative or idea. We have done 208; we have done CRMC plans, which are special area management plans under the Coastal Zone Management Act; and we have done a CCMP, a comprehensive conservation management plan, for Narragansett Bay under the national estuary program. Under that, of course, there were several watershed initiatives.

So we have had our share of experience working in this kind of forum. We decided to sit down and think a little bit about what works and what doesn't when we're talking about watershed planning and distill our experience in that area. I guess I am going to serve to emphasize some of the points Mr. Tedder made and then move on and talk about when we think a watershed plan should be done, and then talk a little bit about how we think S. 1114 can be improved a bit.

I say that with the full support of the initiative that is before us today, this legislation. The emphasis on watershed planning is important and I think that this bill, when finished, will be a big step forward.

Let's talk about what works in watershed planning or strategic environmental planning as a rule.

Getting the stakeholders involved has been talked about and touched on quickly here, but you cannot emphasize that enough. We have seen planning experiences in Rhode Island where in fact some whole segments of stakeholders were virtually ignored. Some of the problems with our conservation management plan, or CCMP, was that the coastal zone management agency was virtually ignored. I think it must be a mandatory provision that the management entity actually reach out to those stakeholders and actually identify them and actually bring that list forward to the public in a way so that anybody who may have been missed would have an opportunity to raise their hand.

Targeting issues has been talked about as how this process can help us set priorities. That is critically important. It is easy for those of us who are environmental advocates to say that everything is important. Sit us down and work through the issues. Make us say that the progress we have made on toxics is pretty good so far in this watershed. Our critical issue is nutrients. Let's all do something about nutrients on all levels of government. That is an example of the process that must be done to make a system like that work. Otherwise, it becomes just a big pile of actions that people can't identify as to why you are doing what.

Accountability in monitoring is critically important. You have to evaluate where you have gone and where you are going. Volunteer monitoring is something that we are very involved in at Narragansett Bay. It has to be a critical part of that. It is the only way I think you can monitor these watersheds effectively. The resource base in these States are very small—and I will touch on that when I close my remarks.

A final point is that this is definitely iterative. Our experience is that you do a plan, you knock off a couple of things—let's say the nutrient problem or the toxic problem—and then you step back and look at your evaluation and say, "Let's do some more," and you work your way down the list. You have to think of a watershed as a little like a room. If it is all messed up when you walk in, if you try to do it all at once, you can't. You have to start to make lists to get things done. I think it is very important that these plans do that. That is how it would relate to the average person. They need to see lists and they need to see actions and they need to see things that really lead to outcomes.

From our standpoint, when to do a watershed plan—we very much support the idea that the point source program and the nonpoint source program and stormwater regulations should be implemented and implemented fully, but this shouldn't become a process where we can start to question where we are going on those other initiatives. What do I mean by that?

We have a river called the Patuxent River that is grossly polluted and we have three sewage plants on that river. They have all had to do advanced wastewater treatment, but they are now in the permitting phase. The politics of that could have overwhelmed us if we were in a watershed planning type of forum. These cities are in fiscal crisis, but there really need to do this advanced wastewater treatment.

Nonpoint sources are much more difficult to quantify and it is very easy to push the blame off to those sources. So we have to be very careful as we move forward using a whole watershed approach. Our thinking is to do your point sources, do the very best you can with nonpoint sources using management techniques, and then when you need to go further—especially into the activities and powers of local government—bring in this watershed approach and really involve local government at that point. After all, they have the most power in this whole format.

Save the Bay favors things such as stormwater utility districts. That has to be done on a local level. Setbacks from rivers have to be done on a local level. Things that really make a difference in the long-run will be done on the local level.

I guess I want to point out a couple of things that we see as critically important to improving this legislation. First, we would urge you to consider putting a solid matricide for doing watershed plans. I think honestly that if Save the Bay had been forced to go the State Legislature and say, "We need 25 percent of the money to go ahead and do this CCMP for Narragansett Bay," we would have engaged the local politicians in the process and we would have moved forward. When we got all done, they said that we had to be committed because of the investment. We think a local match is very important.

Watershed management plans should be mandatory for areas of non-attainment. I think that has been discussed, so I will move on.

There should be a requirement to incorporate previous watershed management efforts. One of the frustrations we have had is that it seems as if history starts with every new government program. We don't go back and look at 208, look at the CCMP, look at the myriad of plans that have been done.

The requirements for public participation need to be better defined. The term "maximum extent practical" means nothing to the local advocate. We need to define that public participation and establish how issues are identified and priorities are set. In some circumstances, we need to protect from the viewpoint that a politicized process leads cities to backing off point source actions.

The final point I want to make—and it is a sobering point—is that in Rhode Island right now, we have permit backlogs as long as your arm. There are big problems in States getting the work that they are required to do done now. Perhaps one of the strongest pieces in this legislation is the need to raise permit fees. I think if we are going to move ahead with the strategic initiatives like watershed planning, let's not forget that the water quality programs right now in our States are starved.

In Rhode Island we just took a 10 percent budget cut on the State level. The State has been raising fees all along. The need for the Federal Government to set a fee structure in place to protect water quality is critically important in our minds.

Thank you very much for the opportunity and Save the Bay really appreciates being here.

Senator GRAHAM. Thank you very much, Mr. Spalding.

Ms. Stickel?

STATEMENT OF LORNA STICKEL, REPRESENTING THE WESTERN GOVERNORS ASSOCIATION, DENVER, COLORADO

Ms. STICKEL. Good afternoon.

I am Lorna Stickel, Chair of Oregon's water resources commission and chief planner for the Portland Water Bureau, which is Oregon's largest municipal water supply system. I am also a member of the Western States Water Council and have been for 4 years. I have been asked today to testify on behalf of Governor Barbara Roberts, who is co-lead governor for water for the Western Governors Association. WGA and the Western States Council work together to provide strong leadership in developing regional solutions for water issues in the 18 western States, and I have been involved in many of those activities over the past 4 years.

To encourage the benefits of a watershed approach under the Clean Water Act, the Council and the WGA have position papers that encourage the Clean Water Act to first encourage but not mandate a watershed approach to water and natural resource management protection. It should allow flexibility to States and local entities to craft basin-specific goals and programs that are prioritized on the basis of risk to quality of life, human health, and ecological concerns.

It should emphasize performance and not planning. It should not interfere with the rights of States to allocate supplies. It should allow States to use existing authorities and programs to establish watershed entities to meet their needs as they understand them.

It should require EPA to provide technical, financial, and research assistance. It should provide Federal funding to support watershed management. And it should support integrated regulatory programs and consistency within the Federal programs themselves.

Title III, as proposed, addresses the principles listed very well. Therefore, I am here to speak in support of the proposed amendment.

The Oregon experience itself—Oregon has had a long history of water quality and quantity planning on a basin and sub-basin level. Many of these early plans were based on regulations rather than a broad view of actions. The State is implementing, as a result of a court decree, water quality plans in 15 water quality limited watersheds.

A reading of the Oregon documents that I have submitted will demonstrate to the committee that this State is well on its way to a voluntary program that matches the title III proposal. Some of our experience, briefly, include that our Legislature established a governors watershed enhancement board in 1987. Since then, nearly \$2 million has been awarded for 62 major projects with actual on-the-ground physical improvements.

Two, the Governor's forest planning team has been reviewing National Forest and Bureau of Land Management plans and emphasizing the watershed approach and the need to protect uplands to benefit water systems. After the Snake River Salmon species were listed under ESA, the Northwest Power Planning Council called upon Bonneville Power Administration to fund model watershed programs in each of the affected States. The Grande Ronde Basin in Oregon is one of those.

In 1990, following a legislative session that debated but did not resolve the issue of needing more locally based water resource planning, State agencies developed a pilot stream restoration program. We did that in the John Day Basin. It uses a watershed approach to stream restoration and has served as the basis for implementation since then with several successes.

In 1992, the State's strategic water management group, chaired by the Governor's office and composed of all the agency directors, formally developed a new watershed management strategy. The SWMG watershed management report is enclosed in the written testimony.

This process is being formally recognized by our Legislature at this very moment in this session. The law does not codify the process, but sets it up as a 4-year pilot program.

In a major effort to manage resources holistically, nine State natural resource agencies teamed together to prepare a funding proposal to restore watershed health and sustainable production in two critical basins of the State. It is likely to receive between \$7.5 million and \$10 million over the next 2 years.

In terms of some suggestions for this specific bill, we would point out some of the following:

First, the interagency committee needs to have a more specific charge directed to it because it is unclear at this point. They certainly could be used to help develop the guidance rules that are mentioned in that section.

Two, we would suggest some new language regarding the management entity, which should be designated as coordination entities rather than having specific responsibilities for funding and implementation. My written testimony provides some specific language changes.

Three, time frames need to reflect that protections for quality watersheds may be a high priority—this is the refuge system concept—and may require some flexibility in timing for problem areas. This reflects the issue that in many cases you don't just necessarily want to focus on the problem watersheds, but you have high quality watersheds in many parts of the west and you do not want them to get worse. You want them to maintain and continue the high qualities that they have. Watershed planning works equally well on that basis as well. We suggested some specific language for section 304 on nonpoint source pollution control.

Four, there may be a conflict between the requirement for Federal consistency on page 94(a) and the State water section (j) on page 97, which notes that Federal requirements under environmental laws are not meant to be affected. There would appear to be a conflict between those two sections.

Five, what is the relationship between the waters of national significance section requirements and this section on comprehensive watershed management? I would venture to guess that a majority of the waters in the western States would meet the definition of waters of national significance as you have defined it in this bill. Due to the deadlines in that section that States shall designate and that States shall implement plans within a 2-year period, the end result could be to make both sections mandatory, basically, and in a very short time frame with a very heavy load on resources that need to be brought to bear.

In conclusion, we haven't always done a good job—and we will admit that—in devising mechanisms that accommodate the diverse group of interests. This act deserves credit for trying to do so. It is important to maintain the flexibility that will promote solutions tailored to varying State issues, management structures, and laws. The answers lie within the specific targeted watersheds and developing them at the watershed level. It will provide the local buy-in that can achieve lasting results.

Addressing environmental issues on a watershed basis holds great promise because it fosters the most efficient use of public resources and participants.

Thank you.

Senator GRAHAM. Thank you very much, Ms. Stickel.

We will now turn to a period of questions. As I indicated earlier, one of the reasons for this particular format is to encourage discussion among the witnesses as well as with us.

We have heard some very persuasive testimonies on the benefits of watershed planning. To ask you to be the devil's advocate for a moment, what has caused the majority of States, as of today, to not adopt a watershed planning approach? What have been the constraints on their doing so? And what is your evaluation of the 208 program, which over 20 years ago was intended to encourage a more holistic approach to water planning? Why did it not achieve its result? What lessons can we learn?

Mr. Anderson?

Mr. ANDERSON. I would like to begin with 208 first?

I think there were two faults with 208. The first one was that it quickly lost relevancy because as the regional planning effort was moving forward, the major program that was being addressed at

the same time was the construction of wastewater treatment plants and those agencies in the government that were doing that were oftentimes not involved in the 208 process. So as the 208 plans were completed, they became, in essence, a report that went onto somebody's shelf and really didn't become relevant for the long-term direction of the region.

I think there really wasn't local buy-in, oftentimes, for that reason. For any kind of planning process to remain relevant and to the point, the commission has to be made up of all the major players, the people who can plan, people who can design, construct, operate, maintain, pay for, and regulate the plan. I think that is probably the main failure.

I think a lot of the States don't take up watershed planning for two reasons. One is because of limited resources and all the other mandates that they already have to deal with. The second thing is the uncertainty about whether or not there will be buy-in at the Federal level once the plan has been completed.

I have seen that up close in southern California. The Santa Ana River is a watershed that is east and slightly south of the Los Angeles area. There was a regional plan that was completed just within the last couple of years with site-specific objectives and objectives tailored to that particular river. Once it went up to the EPA regional office, it really fell on deaf ears. There wasn't the continued buy-in and participation at the Federal level. That is why it is very important to get everybody linked up at one table.

Senator GRAHAM. Any other comments?

Mr. Tedder?

Mr. TEDDER. I will just briefly touch on 208. I think it was covered very well by Mr. Anderson.

I think 208 came across as an overlay program. It did not really integrate with the other programs that were in existence at the time. Therefore, the States did not really get the support from the existing programs and the public that could have been there had it not been an overlay program. I think that was the downfall of 208 and the reason we have a lot of bookshelves lined today with those documents.

As far as the States not moving toward the watershed approach, I think it gets down to the ever-increasing demands and new initiatives that have been placed on the States both at not only the Federal level but at the State level. They have been tremendous. Simple things such as 5-year permits and the enormous backlogs the States are trying to overcome right now will never happen unless we look at that issue and create the time—I think that is the essence of it—the time to do the watershed and the plan and eliminate some of the multiple reporting.

Eliminate some of the widget counting for the sake of widget counting that the States are saddled with right now and I think they will turn those resources into watershed management plans.

Mr. SPALDING. I would like to comment on 208 just quickly.

I think it is important to remember what period of time we were in 20 years ago. As Charles Gauvin said, we had raw sewage flowing into Narragansett Bay with grease balls washing up on Senator Chafee's beach. So to some level, I think to the average person there was a touch of irrelevance about it. When you could see these

big industrial sources and these big sewage plants spewing raw waste into our bays and rivers, the idea of local setbacks and a myriad of small actions just didn't seem very important.

I guess I could testify from Save the Bay's standpoint that we focused primarily on point source sewage compliance for a number of years. To 208's credit, it did say clearly that we needed to upgrade our sewage plants in our basin. That literally has happened. So it shouldn't be considered a total failure, but clearly we didn't get very far down the list.

Senator GRAHAM. Any other comments?

Mr. GAUVIN. Just one point on 208 as well as to underscore what was really the unreality of 208.

I was the legislative point person for the 208 program in Rhode Island shortly after graduating from college and was plenty green behind the ears. I got out and tried to sell nonpoint source control legislation to a Legislature which had many leakage sewage treatment plants and other big problems, including toxic waste dumps. There was a real air of seriality to it. It just seemed to be the wrong environmental priority at the wrong time.

Something like that now, though, which is watershed-based, and which really seeks to integrate particularly the fish and wildlife habitat considerations I think hooks into problems that people are well aware of now and that will receive a fair hearing and a very, very enthusiastic reception in the States.

Senator GRAHAM. Ladies and gentlemen, I apologize, but we have a vote underway right now. We will take a short recess until we return from the vote, at which time Senator Chafee will ask the next round of questions.

Thank you very much.

[Recess.]

Senator GRAHAM. While we are waiting for Senator Chafee to return, I will start with my second round of questions.

I was very interested, Mr. Tedder, in your presentation of watershed planning in North Carolina and the description Mr. Spalding and others gave of the effort in particular States.

I would like to ask some more specific questions about just what watershed planning means. Let me ask a series of questions and then you can respond without feeling that you have to necessarily answer every question in order to get a passing grade. I would encourage as much specificity—for instance, Mr. Tedder, if you would like to select a particular watershed in North Carolina for purposes of illustrating how the process evolved—what was done to identify the help of the river and the causes for its lack of help if in fact it was determined to be impaired?

What was the range of options available to address the various forms of impairment? Which option was selected and why? What were the consequences of that choice? How are you monitoring those consequences?

How has all of the above differed from what might have happened had you not chosen to engage in watershed planning?

Mr. Tedder?

Mr. TEDDER. Let me give an example. I will use the Neuse River Basin, which happens to be one that has completed the process. The plan is in effect.

Senator GRAHAM. For those of us who are not from North Carolina, where is that geographically?

Mr. TEDDER. That basin covers much of the State from the Raleigh area in central North Carolina to the coast. It is approximately a 300-mile stretch of river and tributaries.

What was the background to identify the problems? This was an effort that began in the late 1970's with numerous problems within the river system. We started a very intensive monitoring program at that time to identify the major areas that needed to be addressed in the Neuse River Basin.

As we looked at the range of options at the time—and again back one second because I think it focuses on a previous speaker's comments—not only were we using chemical information, but we were using biological information very extensively. I think that is very important to successful monitoring programs, as well as looking at the land use and what goes on within the basin.

As we looked at the range of options that we had available, there were many. We chose to implement some earlier and some in the actual basin plan. One of our supplemental classifications in North Carolina is called nutrient sensitive waters. It is a special designation for waters and if so designated allows our commission and our agency to prescribe various nutrient controls to address that particular situation, which we did in the Neuse River Basin.

But it also allowed us to look at other areas. Our basin-wide approach is not a new regulatory program. We have looked at those areas in the basin. We were initiating efforts throughout our program—whether it be animal operations—we are an agricultural State and the coastal part of North Carolina—that was an area of concern. We again stressed the control, working with our nonpoint source agencies directing agricultural cost share funds to that part of the State for animal operations and agricultural problems. That was part of the solution.

We chose many options, and I think that is what you are going to find in any basin plan. There are going to be numerous options. We chose numerous options such as nutrient sensitive waters, NSW. We are concentrating on animal operations, not only with new rules we have just recently adopted but also the State right now has about \$8 million a year that we put in a cost-share program in trying to direct those resources toward the problem areas of the State.

The consequences of the choice and how we are monitoring the consequences—the best consequence was that we got tremendous support from the regulated public, from the public in general, from our Legislature using this approach for this basin and for the entire process of watershed management. The public really got behind the process. I think that was the best consequence out of the entire exercise we went through, plus I think we focussed direction to address the most significant problems and to focus on those problems in the Neuse and get more realistic results in a faster time frame than would have otherwise happened.

What would have been different? I think we would have had lack of public involvement in the overall decisions and understanding the basin and its problems and how we're going to direct those resources. We would have probably continued to waste resources—I

hate to say—because I am totally convinced that the watershed approach is much more efficient. We would not have had a plan.

We would have been addressing very specific situations in industry, municipality, or any particular discharge, maybe some component of the nonpoint source. But we would not have put a fully implementable plan on the ground for everyone to know what that plan is and where our focus would be for the next 5 years, not just a focus for tomorrow or the week after.

How do we follow-up? These plans are set up so that they have to be revisited every 5 years. One of the things we are implementing in each of the basins is a very dynamic monitoring program to ensure that we can fill in the gaps that we identify each time we go through the process and also to measure the success of those management actions in that basin.

Senator GRAHAM. Any other comments?

Ms. STICKEL. I would like to address that the scale of the watershed issues in many of the western States is really quite large with sparsely settled areas. One that I would call particular attention to is the John Day Basin in Oregon, which is a major tributary of the Columbia River and is one of the only rivers in the State that does still has a wild fish run of anadromous fish. It is not supplemented by hatchery fish. It also has almost no structural storage built on it.

It is a ranching, farming community. It has nine different counties in it, numerous small cities. What was done was that the State Legislature identified it to focus resources on, a large GIS effort—and I can't stress enough, I guess, that I think to some extent one of the biggest problems you face in looking at watershed level planning, particularly if you're going to be aggregating a lot of sub-basins or you are looking at one large basin, is that you can never really kind of get your hands around what the condition of that particular watershed is, particularly in some of the larger States where resources are limited to get that information.

That was a focusing of all the different agency resources, including Federal, State, and local. In that case, a local watershed council was formed, appointed by the county commissions from those various counties. They started to work. They spent about 2 years taking a look at what the issues were, what the problems were with the river. Causes of impairment, particularly in this river system, seemed to be oriented to diversion structures and high amounts of agricultural water diversions during summer low flow periods, large winter flows relatively now because of upland management issues, scour down and leave the watershed relatively quickly.

The range of options that were available to improve some of those situations were both structural and nonstructural. Many times local folks in the west will simply say, "Well, we get the water in the wrong time of year, so let's just store it in the winter and release it in the summer and then we can correct a lot of the problems that we have." In some instances, that actually does seem to be the case because we have modified the natural system to such an extent that it doesn't have the water retaining capabilities that it originally had.

In addition to that upland management was a key issue. There are large amounts of National Forest lands. There has been a tremendous amount of cutting. There has been quite a bit of change to climatic species of vegetation. As a result, you have infestations that come along and then fires, which cause any number of problems.

The options that were chosen were basically non-structural and structural in nature.

Senator GRAHAM. I am sorry, but Senator Chafee is going to have to go to another meeting. Actually, I am impinging on his time. So when it gets to be my time again, I am going to return to you and you can complete that analysis.

Senator CHAFEE. Thank you, Mr. Chairman.

First of all, watershed planning is very expensive. We, in Rhode Island, have spent on Narragansett Bay alone something on the order of \$6 million. We got that money not from one of these bills that we're talking about. We got it from the estuary legislation. So obviously, the situation Ms. Stickel was talking about and Mr. Tedder—they wouldn't qualify under the estuary bill. It is difficult to get the money.

Do all of you agree that it is expensive?

Mr. SPALDING. There is a need to collect data, which makes it expensive, and a need to run a good process. That makes it at times expensive. I think Mr. Tedder talked about other expenses, but definitely you need to put the resources to it.

Senator CHAFEE. The other point is that it seems to me in watershed planning, your point sources aren't a major problem because you have the tools to deal with those. Am I correct that the real problem is with your nonpoint sources such as farmers and woodsmen?

Mr. GAUVIN. Yes, I would say that.

Senator CHAFEE. You have the tools to deal with the point source pollution. You don't need a watershed plan and you don't need persuasiveness to deal with point sources.

Mr. ANDERSON. Well, with one exception. The question is, How far should point sources continue down the road in additional facilities? There is still a large amount of resources that need to be spent for point sources. EPA identified resource needs in the vicinity of \$80 billion. AMSA itself has looked at resource needs for O&M for construction of about \$12 billion annually.

Senator CHAFEE. Mr. Tedder mentioned watershed planning and involvement. We've had some excellent testimony about the New York city watershed area the other day and about getting the farmers involved. It is very good what they have done.

But could you briefly tell me how you get these people involved? How do you get some lumbering group involved?

Mr. GAUVIN. We have had lots of contact with ranchers and wood lot operators and the like through restoration projects that we have sometimes done on private reaches of stream. We have gotten them involved that way. Often when you do a habitat restoration project you can politely suggest—and sometimes be very successful in suggesting—that the way the property is managed might be revised. A number of the people we have worked with have been very responsive.

Senator CHAFEE. Mr. Spalding?

Mr. SPALDING. You can meet when they are able to meet. One of our problems in the Narragansett Bay project was that we would meet during the day when the State officials were available and other professionals in the business were available and they were on the bay. They pointed it out time and time again and we just couldn't move on that. Clearly we have to set these things up so that the average person can get there.

Senator CHAFEE. Mr. Tedder?

Mr. TEDDER. In 15 seconds or less, basically we went through the public hearing process, we would also explain the plan in the media. We spread the word that if we did not get it from a voluntary approach, we would get it from a regulatory approach. That gets everybody out.

Senator CHAFEE. But I don't know how you got a regulatory approach on a nonpoint source pollution problem.

Mr. TEDDER. We very much have a regulatory approach with our turbidity standard in the State of North Carolina and how it is implemented and tied into best management practices. In our forestry statutes, BMPs are required. There are quite a few regulatory approaches that are available.

Mr. GAUVIN. A number of other States have taken that approach as well.

Senator CHAFEE. Thank you, Mr. Chairman.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. Mr. Tedder, I am well aware of what we have done, but maybe for the edification of all of us, why did North Carolina decide to undertake the watershed approach on a State-wide basis?

Mr. TEDDER. To try to sum it up—

Senator FAIRCLOTH. And when did we do it? What year? Was it 1979?

Mr. TEDDER. We began some of our first efforts with the planning initiative—and again, we restructured the water quality program. We put together a format, a brief structure and a thought process whether it is the enforcement, the compliance, the nonpoint source—it all starts to focus into individual basins. It was in late 1970's or early 1980's.

We officially started the process this past year as far as the basins. Also, we had to get all permits in sequence. That takes at least 5 years under the existing Clean Water Act.

Efficiency was the major reason. We must maximize the resources we do have. The effectiveness of the plans we put together, the effectiveness of our actions was another reason. We needed to roll the nonpoint source issues into a plan. We needed to look at what the issues are and not approach everything on a State-wide basis, but tailor it for the needs of specific watersheds.

We also had to look at the backlog. It was mentioned before that States have a backlog with permit situations, which affects new industry. It affects develop when you cannot get the permits issued in a timely fashion, not to mention the reissuance of expired permits. This I think will allow us a long-range mechanism to control that situation, at least in North Carolina.

We have several mechanisms and several rationales to proceed with a watershed approach.

Senator FAIRCLOTH. I have a number of questions, but we are going to have to go vote, so I will ask this: Have you put a dollar figure on how much it cost us to put this watershed project in and to keep it in? What does it cost us a year in North Carolina?

Mr. TEDDER. That is a tough question. Some of my counterparts would probably shoot me for this answer, but basically we have always approached it in North Carolina that it did not cost anything to change a management style. We did not get an increase in appropriations. We surely did not get an increase in our grants for the process.

We changed the way we do business and the way we think of these things in North Carolina. I think we could do that because we addressed the entire State, therefore you can use entire programs to change the philosophy.

So I have always said that it did not cost us anything. Could we do a lot better job? Could we do better basin plans with additional resources? The answer is yes. But at the same time, I think if we look at some of the barriers, that would be incentives as well as financial incentives because the last thing I want to do is to rob from various pots of the Clean Water Act for watershed implementation.

Senator FAIRCLOTH. Do you think the clean water bill we're discussing will speed up the watershed planning process in North Carolina, or being as far ahead as we are, will it tend to slow it down?

Mr. TEDDER. As written, I think it would probably slow the process. Again, I say that because of designations of certain watersheds. Again, looking at the language of the governor—Administrator approval—what I see there are Federal bureaucratic hoops that we would have to go through that we have already gone through. Would it be worth it to us? The answer would be no.

Senator FAIRCLOTH. Thank you, Mr. Tedder.

Senator GRAHAM. You can take another 2 minutes, if you would like, Senator Faircloth.

Senator FAIRCLOTH. Since this is a big issue nationwide—we saw it the other day from New York—you have worked with it over a period of 17 years probably one of the greatest concentrations of livestock in the Nation and maybe the world in an immediate area of North Carolina.

What problems have you had? What has been done to solve them? What is the position we are in today with this vast concentration of livestock?

Mr. TEDDER. It has been a major issue in our State. Actually, in February of this year our commission adopted some fairly comprehensive animal management rules. The intent is to have a form of control over every large animal livestock operation in the State. The turbidity standards, which were adopted some time ago, tie in to the entire agricultural arena as well as the animal operations.

We now are getting a lot of support from the various agriculture agencies within the State because we think we have put forth a plan and a mechanism for control with the animal operations that is realistic, does not drop the heavy hammer all at once, and gives

them a chance to make it work. We are hoping that will be a very large success for what we consider to be one of the major issues in the State right now.

Senator FAIRCLOTH. I thank you.

Senator GRAHAM. Thank you, Senator.

We will recess again for purposes of this roll call vote and will reconvene as soon as possible.

[Recess.]

Senator GRAHAM. We will reconvene.

Ms. Stickel, about an hour ago, you were in the midst of responding to the question relative to the practical implementation of watershed planning. I apologize for the long interruption, but if you would like to conclude your response to that question, you may do so.

Ms. STICKEL. I guess what I decided to do in the meantime—particularly since I start getting nervous when my plane is getting close to leaving—I am going to go ahead and submit some information from Oregon about watersheds related to answering these specific questions. I will send that to you.

But I would say in general—Mr. Gauvin raised the issue that quantity and quality issues really are wrapped together. I think we in the western States totally recognize that. Much as we in the past probably have been perceived as saying, “Hands off that concept. We don’t want anyone thinking about the quantity relationships,” clearly they are there. We recognize them.

I think the days are different today than they were back when 208 planning was beginning, which was much more focused on the quality issues and the agencies that are responsible for quality issues. I think today, with the amount of political jurisdictions that are out there mucking around in water issues, the amount of regulatory things that are put down on people—growth pressures which exist in many parts of the urban west, in particular—that people are beginning to realize that they are having trouble getting to do what they want to do.

They are seeing handwriting on the wall that says that if they don’t start dealing with some of these issues in a more holistic fashion, a couple of things are going to happen, both of which relate to dollars. One is that they are going to go to court. There is no bigger money suck than going to court. I am sure most of you in this room are probably aware of that.

There is a lot of money that is going to have to be spent to fix problems that have been coming up on us for a number of decades and to be able to continue, then, to make uses of water in the most efficient way possible.

To this question about what leads people to use these kinds of approaches—I think if you look at Portland’s problems with CSOs that are going to cost somewhere between \$750 million and \$1 billion to solve under the most recent estimates, if you look at meeting regional water supply needs in the whole Portland metropolitan area, we are looking at least \$500 million. You say to yourself, “What is the most efficient way to spend those dollars?”

It isn’t sitting around in court. And it isn’t writing tons of environmental impact statements. It is taking a look up front. It is looking at all the stakeholder issues that are out there and saying,

"Can we come to the table and meet needs in a much more win-win environment than we have had in the past?"

I know that is a cliché and I know that from an environmental perspective—myself being one of them—I often look at the slice of the pie that is left and say, "What do you mean balance? We are not talking balance here, we are talking about restoring imbalances."

I think that a lot of people recognize that quality of life issues are getting elevated in people's minds. I know the economy is a major issue for a lot of people in the west, but economy now is wrapped up not only with resource extractive issues, but also with other issues related to just why you went there in the first place and what you're trying to do with your life.

I think many of us see that this isn't just an exercise anymore. This is where it is at. This is what is going to get us from A to B, out of decisionmaking gridlock, out of being in court, out of being put down heavy regulatory programs—these issues are our issues. They are not congressional issues solely. They are State issues and they are local issues.

They are there. The more you can deal with them on the direct basis level of the problem shed that you're trying to deal with, people are coming to the table. And they are not having to be dragged kicking and screaming. So I really do think times are changing.

We have needed this time period beginning with the environmental era and moving on its way through the 1980's and now into an era of restricted resources. I think this kind of a technique offers the best way to win your way through this process.

That is my soapbox.

Senator GRAHAM. I would like to frame three or four issues and would request as direct a response—including yes or no being satisfactory.

This bill takes the approach of voluntary watershed planning with incentives and inducements to do so. There has been some suggestion—I think Mr. Gauvin stated that making it voluntary is almost to ensure its failure.

Briefly, what is your opinion? Should Congress go beyond the language that is in the bill and make this a mandatory program that all States would have to adopt?

Mr. Anderson?

Mr. ANDERSON. Yes. AMSA's position is that it should be mandatory. I think you just heard a terrific argument for that position. Once you have everyone at the table—and as painful and as argumentative as it sometimes is, particularly in the early going—it is the only way to develop consensus and to target the real priorities within a watershed and to be as efficient as you can at addressing the problems.

Senator GRAHAM. Mr. Gauvin?

Mr. GAUVIN. Senator, I would agree. The important qualification—the biggest problem in the watersheds we are going to be dealing with is nonpoint sources. If you tighten up the provisions in the bill on nonpoint sources and address a number of these issues in the regulatory context, you probably don't need to make

the planning part strictly mandatory because, frankly, the problems are so difficult and so important that people will plan.

Senator GRAHAM. Mr. Spalding?

Mr. SPALDING. I guess I would agree with Mr. Gauvin.

Basically, we share a concern that if you take this approach as it is defined, you will in some cases perhaps take the pressure off point sources. It has been discussed why AMSA likes the process. They see opportunities not to have to do some things with their sewage plants.

Senator Chafee did point out that there is a certain enforceability around that program that has worked pretty well now for 20 years. Nonpoint sources are much harder to get a handle on.

I worry that if we make it mandatory we will somehow open up doors that we don't want to. On the other hand, it is a very good approach and needs to be taken very seriously in all watersheds.

Senator GRAHAM. Is your answer that you think we ought to make this mandatory?

Mr. SPALDING. I think with the qualification that he had, that we tighten up the nonpoint side a good deal.

Right now, I think you should do it where you have to do it. Where your standard program isn't working, you should mandate this kind of approach. North Carolina has taken it as a management approach for the whole State and they are very persuasive. But different States have different ideas on how to do things.

But I think where you have a non-attainment area it certainly should be mandatory.

Senator GRAHAM. Mr. Tedder?

Mr. TEDDER. I hate to disagree with all the speakers, but I think it should definitely be voluntary at this point. I think we have a lot of momentum from the States around the country for the watershed approach. Again, it is one thing to say voluntary versus mandatory, but then you have to read on through the bill and listen to others talk about all the other hooks that are going to catch you if you want this to be mandatory. Then you have a one-size-fits-all approach to watershed management and I think it will doom the process almost from a guaranteed standpoint.

Senator GRAHAM. Ladies and gentlemen, I am afraid that we have another vote. Let's take 5 or 6 more minutes.

Ms. Stickel?

Ms. STICKEL. I would agree with Mr. Tedder in terms of—I would say a qualified no. That was real good about taking my arguments and flipping them around to the other side. I agree that you could read it both ways. But I think my arguments were to say that it is happening anyway. I suppose you could say, "Well, since it is happening anyway, why not make it happen?" I guess I tend to feel that it isn't just an issue. Watershed planning is not just water quality oriented.

That is the point I was trying to make, particularly in western issues, that they are quantity related. They are supply related, meeting changing demands, and actually continuing to meet the demands you already have. So I think that if you want this program to work, you give it the right incentives and it will be used. And if it is not—and I think States are really willing to put this on the line. I think States are saying, "We are willing to step to the

table. Hold our feet to the fire. Test us. Monitor us. Make us come back and tell you whether this thing is working or not. If it is not, fine. Then we understand."

But I think we want a chance and an opportunity to show that this can work without it being a top-down requirement for it to do so unless we choose it to get the incentives you have built in. And there are some substantial incentives here, as I see it.

Senator GRAHAM. I am going to ask a couple more questions and then I will have to leave. I am going to ask the staff director, William Leary, to ask the balance of the questions which we have so that we can complete the record without undue further delay.

One of the reasons that was given for the 208 program's lack of success was that it did not properly tie planning to implementation. If you want to editorially disagree with that assessment, you are at liberty to do so, but if you do agree with it, it seems to me that there are several implementation issues which we need to be thinking of.

This is not a complete list, but some of those would include the questions of cross-State boundary issues. Should we set up a process that would recognize that there are going to be multi-State watersheds and lay out how those are to be dealt with?

Also the questions of non-structural response exist. I will state a bias. Florida has had many years of experience with what we call our Save our Rivers program, which has as its goal acquiring the flood plains around our major rivers as the principal line of defense against nonpoint pollution. Should there be a non-structural implementation strategy in here, such as a Federal/State partnership for land acquisition? Or what else would you recommend? And are there other implications for implementation of adopting either a permissive or a mandatory watershed planning process?

In 5 minutes or less, let's talk about those issues.

Mr. SPALDING. I think your non-structural approach is a valid one and a good way to go because ultimately structures tend to create as many problems as they solve. You are concentrating pollutants. Then you typically have to slow them down and let the pollutants sink out or treat them. If you can acquire areas, that is a much better way to go.

In Rhode Islands, most of our rivers we built right up to, so we are going to have to come up with something else, like plow into pavement and create some wetlands. But I think that is a good approach.

Senator GRAHAM. Any other comments on the implementation implications of watershed planning?

Mr. GAUVIN. In the nonpoint context, I would downplay the significance of the multi-State or interstate problems and look much more closely at the conflicting jurisdictions, particularly in the west, where you have Federal land and non-Federal land and look at how you can develop standards that really look at watersheds and seek to fix habitat no matter what part of the river reach it happens to be located in.

One of the things that is unique about the Clean Water Act and one of the things that we need to bear in mind when we look at nonpoint controls and how they apply is that the Clean Water Act is the only vehicle of general jurisdiction to deal with the checker-

board in the west. It is in many respects the only firebreak between the problems we have today and the Endangered Species Act.

Ms. STICKEL. I would add that if there were a tie between States dealing with interstate issues and Federal programs, including consistency of Federal actions, funding, and flexibility with regulatory programs, I think you would find a much greater use of the interstate issue.

I know in the northwest, timber issues—but in particular, endangered Salmon issues—have forced States to come to the table whereas before they had very little incentive to do so. They certainly see a lot of incentive to do that today.

I think that if there is one thing that would be beneficial, it is for the Federal Government to set the parameters for what the Federal interest is, and then get States to step up to the table to work out how those issues are to be resolved.

Mr. TEDDER. I would agree to downplay the cross-State boundaries issue because I am not sure that is really an issue here with the watershed. I do not really care if my neighbors disagree with our approach or if I disagree with theirs. If we are looking at a watershed approach on a voluntary basis to improve the programs in selected areas where you need the effort, let those move forward. Once you start trying to mandate or set in motion something with the act that will settle cross-State boundaries—again, I keep emphasizing—what you have done is made a one-size-fits-all approach.

I do not think that will do anything to push this management concept forward by pushing that approach.

Mr. ANDERSON. I would like to address the issue of one-size-fits-all. I think some of the interstate issues are an excellent argument for a mandatory program. Look to the Great Lakes, the Mississippi, the Gulf Coast, the Columbia River, the Chesapeake—it could go on and on about major water systems that require interstate cooperation, which also implies that you are going to have to have some State evenness in how public policy is applied.

It does imply a tremendous amount of cooperation that I think can only go forward when everyone is at the table. There are many special interests who have a stake in the status quo. If they are not at the table and they are not dealing with issues, then the problems they are generating to be solved are not going to be evenly addressed.

I really think it is essential for the process to move forward and that it has to be mandatory. But once you have said that, the approaches that are taken by the individual commissions—the size of the table—there is some flexibility that can be applied to that. But you have to get everybody to the table.

Senator GRAHAM. Ladies and gentlemen, I apologize, but I am going to have to leave again. But rather than recess, I am going to ask Mr. Leary if he would take the Chair for purposes of asking the remaining questions we had identified for panel one. When we return, we will move to panel two on enforcement.

Mr. LEARY [assuming Chair]. I want to follow-up on the question of interstate issues and address more specifically intrastate jurisdictional problems.

Insofar as the bill authorizes the Governor to create a management entity—it could be the State, local, or regional—in Florida we have water management districts that already exist that pretty much follow watershed boundaries, but a lot of States don't have a regional structure set up.

In your State where you have gone to watershed planning, how do you deal with the jurisdictional disputes that would invariably occur when a watershed doesn't adhere to those boundaries?

Mr. Tedder?

Mr. TEDDER. I am not sure we really have one that does not adhere. My problem with the designation of a management entity within North Carolina for water issues—those are so delegated from the Governor already to the agency. That would allow, based on a watershed, is numerous management entities which may lose the consistency of the planning process, lose some of the expertise involved in basin-wide and watershed approaches, and in some cases—probably not in North Carolina but it could happen in other situations—the wrong entity being designated to address the problem. I know that is a fear in many States right now.

I think that might be a bit of a time bomb sitting there, for that flexibility to be in the act.

Ms. STICKEL. I guess one of the things that I would point out is kind of a cliché, but it is that form follows function. I think if you want to dictate form first without thinking about function first, you may well wind up with new layers that you hadn't thought through in terms of what their objectives are. I think one of the things that we're looking at is in the use of integrated resource planning, for instance, to help solve very difficult, complex, inter-jurisdictional water problems.

One of the things you have to do is an institutional analysis to begin with and factor that into the kinds of alternative answers that you wind up coming up with. So then you wind up creating institutions that answer questions, that get at objectives, that deal with actual implementable programmatic things that you want to do. You don't start the other way around and then make the process work to sort of fit it into a square hole.

I would echo Mr. Tedder's comments. We have some concerns over the use of that management entity and would suggest that you make that a bit more flexible and broad so that you can have coordinating entities. So long as you are accomplishing objectives by using the multiple agencies that are already out there who have authority and responsibility and funding to solve problems—which works all the way from a landowner all the way up to a Federal program that is passing through Federal dollars—you should do that. But don't do it in a shackled kind of a way that says that you must do it this way.

Mr. LEARY. Mr. Anderson, your proposal is the creation of a commission?

Mr. ANDERSON. Right, a commission that would, among other things, recognize existing entities and existing programs. For those that are already on the ground and operating, you would attempt to add to the governing board to include some of the spectrum of interests I mentioned earlier.

From a local perspective, in those areas where active watershed planning is not now occurring, we see an incredible amount of gridlock. In my watershed, the Santa Ana River, which is about 1,700 square miles, there are three county governments, three State agencies, four Federal agencies, 35 wastewater treatment plants, 50 cities, 2,000 miscellaneous direct discharges, and then all the other miscellaneous interests of agriculture, urban, mining, gravel operations—all of those in a very uncoordinated fashion.

So the Santa Ana River is not being managed. There are these puddles of programs here and there that address wastewater treatment plants, stormwater, but it is not all unified in one clear program for managing that river.

That is probably the situation in most parts of the country. I think North Carolina should be complimented for how progressively they have moved on this plan. AMSA is saying that we should not throw out the North Carolina approach or what is going on in Oregon, but to use those as examples of moving forward on a national scale.

Mr. LEARY. Let me move on to the issue of designating impaired waters because the bill does mandate that States designate impaired waters.

The legislation, however, does not give States a great deal of guidance in that. Is there reason to be concerned that the variations from State to State in the designation of watersheds requires greater guidance? Or do the States need the flexibility that the bill seems to provide?

Mr. ANDERSON. I think if everything is a priority, then nothing is a priority. So it is important that whatever criteria are used in establishing what you're going to do first, you take into account those major issues of importance.

We believe that you must set priorities. Using an impaired waters designation or some other designation is rationally based is certainly the way to go.

Mr. TEDDER. Just as a comment, I don't think there is anything wrong with looking at impaired waters. I am not sure that we need expansive criteria. I think the States have done a fairly good job. What we do not need is a third list or a fourth list of impaired waters. When you look at 303(d) and 303(e) and 305(b), pretty soon we are going to run out of waters to put on the list.

I think we need to be careful with redundancy in the act if we are going to come up with another impaired waters list.

Mr. SPALDING. I think it is usually pretty clear what is impaired, at least in our situation in Rhode Island, because we do have some seriously impaired water. But we do have inconsistencies between the two States that are the Narragansett Bay Watershed. It would be good to clear that up. But I think that can be done on a regulatory level. I think if EPA was working harder toward making water quality standards consistent and adding some of the good standards they are using in North Carolina and moving those ideas around we wouldn't have the problem that we have now.

Mr. LEARY. Looking at the time line in the bill, the bill provides that States would designate impaired waters within 2 years and then there be two 5-year rounds, so to speak. In the first round, within watersheds, the State could use site-specific plans or nation-

al best management practices. However, in the second round, the site-specific plans would only apply in watersheds where there has been an approved watershed plan. This is seen as an offensive to the States to engage in watershed planning.

In the hope and expectation that over that period of time these watersheds would attain water quality standards, then the national best management practices would not apply. On the other hand, if they failed to, some farmers in these areas would lose site-specific plans and be subject to national BMPs and are concerned about this.

Do you agree with the concern they are raising? Do you believe that States will be able to attain water quality standards in that time?

Mr. ANDERSON. It is tough to ask anybody to be accountable for somebody else's actions or inactions.

Mr. GAUVIN. I think one of the other problems is that we have very little information on the effectiveness of many BMPs, even though we have been using them for years. As we acquire additional information, and as we start looking very closely at these watersheds, we are going to discover that the BMPs—by accident or design—have been quite effective in some places and not effective in others. It is going to seem very irrational to someone who is phased-in control suddenly to find that the thing doesn't work and that you are losing that turtle species or frog species or fish species and you have a big problem on your hands. Suddenly you have to then go to a radical rationing down.

I think a much better objective is to look at changing the threshold for determining what impairment is. Right now, current water quality standards are way off the mark for most nonpoint source pollutants in a number of cases. What you need to do is empower the States and authorize the States—direct them to redefine the standard for determining impairment and to adopt water quality standards that specifically address the pollutants of concern in the dynamics of nonpoint source pollution.

Mr. LEARY. Then getting back to an earlier question I had, do you think the legislation needs to give States greater guidance in the designation of impaired waters?

Mr. GAUVIN. Yes.

Mr. LEARY. Mr. Spalding?

Mr. SPALDING. Could you repeat the question? I am a little lost here.

Mr. LEARY. I would go back to my original question, which regarded national BMPs versus site-specific plans and whether you agreed with the concern of farmers that this was a penalty upon them if the State fails to get an approved watershed plan.

Mr. SPALDING. I guess I am somewhat skeptical about any of these time lines, if that is what you're leaning toward.

The record is that these clean water time lines are not real time lines in the long-run. We go by them and set new ones, and we go by them and set new ones.

There are a lot of reasons for that. A lot of is what Charles just talked about, that there are a lot of unknowns out there. Achieving water quality standards within 10 years—you think it is doable from here and we are all talking about it, but there are a lot of

unknowns about how to really control a lot of this nonpoint pollution, especially in heavily urbanized estuaries like Narragansett Bay.

You talk to a city planner and ask him what he is going to do about stormwater runoff in Cranston down at the lower end of the Patuxent River and he says, "There is nothing we can do. It is all built out. It all goes into the river. Where do I send the stuff? What do I do with it? How do I treat it?" It is a huge load because there is a bunch of paved area.

This will ultimately end up being the best-we-can-do type of approach and we all have to push hard for that. But we shouldn't back away from trying to achieve those goals, because that is the incentive. We can't lose that enforceability. It is a tough thing. I don't know how else to put it, but I am jaded by the real world experiences of trying to achieve water quality standards in heavily polluted northeast rivers.

Mr. LEARY. Any other comments?

Mr. TEDDER. When you mentioned meeting water quality standards, I would have a concern—whether an individual farmer or anyone else—when I am not sure what those standards are. Now we are talking new water quality standards that may be promulgated for sediment standards, biological standards—I am not sure what set of standards we are talking about having to be met in 10 years. I am not sure anyone does.

Mr. LEARY. I have just one more question. We will probably be submitting additional questions for you.

Just to get back to a question that Senator Graham touched on, in the State of Florida, there are a number of State programs that are designed to acquire land. One of the mechanisms that has been used to protect river basins has been public ownership.

The legislation puts a registration on the amount of 319 money that can be used for land acquisition. I am curious what your view is of land acquisition generally as a tool in watershed planning, and second how much flexibility the States should have to use that tool. Or is there concern that they could dry up all the money just for that one purpose?

Mr. TEDDER. I think there is a concern as far as impacting the programs. I think as you read through the bill, you can see that it is reaching in and robbing different parts of the program right now for watersheds.

The concept itself of public ownership for protection—there is nothing wrong with that. How you pay for it and what suffers to pay for it I think is of concern.

Mr. SPALDING. Our experience is that there is a tremendous amount of work being done on land acquisition. There are other sources of Federal money. There are foundations and organizations devoted to it. The problem is in deciding what land to acquire, strategically, and where it is important. There isn't a lot of work spent on that. I would argue that the 319 money should be there helping us make those strategic decisions and recommendations, and then local resources and other Federal resources can be brought to bear to actually acquire that land. There are other sources out there.

Mr. GAUVIN. I don't think the States ought to be allowed to spend it all in one place or in one basin, but I think we shouldn't

deny States the flexibility to be able to demonstrate that they can acquire, at least through conservation easements or other restrictions, the kind of control over the flood plains, the wetlands, the perennial and ephemeral tributary streams that really go into the watershed that affect the water quality of that watershed.

If a State can demonstrate that and can do it, and wants to proceed in that way, I don't think there should be a restriction. I do agree, though, with Mr. Spalding's statement that there is a tremendous amount that needs to be done on the basic knowledge and information, particularly on the strategic side, to come together. Unfortunately, I think States have largely squandered that kind of money in the past. I guess it would be refreshing to me if you can have a State regulator come in and show you on a big map that he or she can control the nonpoint source problems in a basin through land acquisition or development rights acquisition—all power to them. Let's do it.

Mr. ANDERSON. I would like to also add that I think if we take a lesson from the page of the 1972 Clean Water Act that much of the early advances that we had in water quality, which was related to point sources, had a lot to do with the Federal Clean Water funds that fueled those programs. I think S. 1114 goes a long way toward identifying many other programmatic areas that need attention today, and those Federal funds will help jump start those kind of approaches.

I think we have to become far more unconventional in how we address water quality problems in the future. There was the mention of what was going on in Rhode Island with grease balls on the beach and those kind of issues, but we are not to those kind of gross levels today. So as we fine-tune water quality, as we go after habitat restoration and other programs like that, we have to have a wide spectrum of opportunity to address the problems that are going to be very site-specific to each watershed.

Senator GRAHAM [resuming Chair]. Ladies and gentlemen, I apologize that we are going to have to call panel one to a close. There may be some additional questions which we would submit and would appreciate your response in writing.

We appreciate your participation, intelligence, and indulgence.

I would ask panel two to please come forward.

The second panel, which will focus on the question of enforcement, consists of: Mr. Ed Lloyd of the Rutgers Environmental Law Clinic, who is representing USPIRG; Mr. Steve Herman, Assistant Administrator for Enforcement, United States Environmental Protection Agency; Ms. Marlen Dooley, director of enforcement coordination, commissioner of New Jersey Department of Environmental Protection; and Mr. Roger Marzulla, who is a partner in Akin, Gump, Strauss, Hauer & Feld in Washington, D.C.

We appreciate all of your participation and I thank you for your patience in the time that it entailed in completing the first panel's testimony and questions.

We are joined by the distinguished Senator from New Jersey, Senator Lautenberg, a senior member of this committee and subcommittee.

Senator Lautenberg, if you have an opening statement or any questions or comments you would like to make, we would be pleased to receive them.

**OPENING STATEMENT OF HON. FRANK R. LAUTENBERG, U.S.
SENATOR FROM THE STATE OF NEW JERSEY**

Senator LAUTENBERG. I appreciate that, Mr. Chairman. I commend you for holding this hearing, as you have on several other occasions, to deal with the Clean Water Act and the subject, though complicated, is important. I also commend you for the interest in getting this legislation to a point where it can be considered and perhaps we can get it reauthorized.

This is an issue that I have followed for several years. More than 20 years have passed since the Clean Water Act was enacted. Its intent was to end the horrifying degradation of our Nation's lakes, streams, and oceans. While water quality has improved since the act, our waters are still not clean, as you and I, Mr. Chairman, know from the coastal character of the States that we represent.

One of the reasons is that the Clean Water Act is not being adequately enforced. The GAO has issued a number of reports finding that the EPA and State enforcement efforts were weak and sporadic. EPA data for fiscal year 1992 indicate that 21 percent, almost 1,500 of the Nation's major industrial, municipal, and Federal facilities were in significant noncompliance with the act at some point during the year, and that 40 percent reported some type of violation.

These are only the worst violators of the largest facilities. The EPA Inspector General has said that the number of facilities reported as being in significant noncompliance is vastly understated compared to the number of permitted facilities. Further, the IG found that in 46 of 69 audits conducted in 1991, penalty assessments were insufficient to recover the economic benefit gained by the violator as a result of noncompliance.

This type of policy promotes, as you would imagine, a pays-to-pollute mentality. An effective enforcement program must provide that those who violate the act cannot benefit. As a general principle, penalties have to recover any economic benefit gained by the violator for noncompliance. These statistics underscore the point that a law is only as good as its implementation. The role of effective enforcement in achieving the goals of the act cannot be overstated. Not only does effective enforcement deter violations, it also helps to ensure that appropriate corrective actions are taken in a timely manner when violations do occur.

Coming from the most densely populated and highly industrialized State in the country, New Jersey has taken a lead in Clean Water Act enforcement. Through State legislation enacted in 1990, the State has sent a clear message to polluters that the mandates of the Clean Water Act must be taken seriously.

I am pleased to have with us Ms. Dooley, the enforcement chief of New Jersey's Department of Environmental Protection, here to discuss New Jersey's experience since enacting its tough Clean Water Act enforcement law. I am proud that my home State is

here to share with us some of the lessons it has learned through its implementation of this law.

I hope, Mr. Chairman, the committee will carefully examine New Jersey's act and take from it some of the experiences and some of the details that have been developed over the years. I think it will help us as we review plans for the reenactment of the Clean Water Act to use the experience factor as an indicator of what can be done, and further, what should be built upon.

I thank you, Mr. Chairman. I welcome the witnesses and I am glad to be here with you.

Senator GRAHAM. Thank you very much, Senator.

Normally, we would call on the witnesses in the order that they were listed in the agenda, but as the Senator has spoken about the program in New Jersey, Ms. Dooley, if you would be willing I would like to call upon you first for an introductory statement.

As we asked of the first panel, we would appreciate an emphasis on succinctness. Your full statement will be printed in the record, and we will turn to questions and I hope the same type of dialog that we had with the first panel.

Ms. Dooley?

STATEMENT OF MARLEN DOOLEY, ASSISTANT COMMISSIONER FOR ENFORCEMENT, NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION AND ENERGY

Ms. DOOLEY. Thank you, Mr. Chairman.

My name is Marlen Dooley and I am the assistant commissioner for enforcement at the New Jersey Department of Environmental Protection and Energy. Thank you for this opportunity to participate in this hearing and present a State's perspective on enforcement of the Clean Water Act.

In 1990, the New Jersey State Legislature unanimously approved and Governor Florio signed into law the New Jersey Clean Water Enforcement Act. The Clean Water Enforcement Act has strengthened enforcement of the State's water pollution control and prevention program by substantially amending the Water Pollution Control Act to require that permits be taken seriously and to ensure that enforcement actions are adequate to effectively deter potential violators.

The Clean Water Enforcement Act was designed to enhance the Department's enforcement scheme in a number of ways. The act attempts to identify the most egregious violators by establishing two special classes of offenders: those responsible for serious violations and those committing a series of violations to be known as significant non-compliant.

To ensure that appropriate enforcement action is taken for serious offenses, the act requires the assessment of mandatory minimum penalties, \$1,000 for each serious violation. These penalties may not be waived or compromised. Permittees determined to be in significant noncompliance are subject to minimum penalties in the amount of \$5,000.

The act also limits the Department's discretion to compromise penalties beyond 50 percent of the assessed amount. In addition, the act requires the imposition of minimum penalties of \$100 per

day per pollutant for each item omitted on a discharge monitoring report. Further, as a means of bolstering compliance monitoring, the act requires that all major facilities be inspected by the Department at least annually, including the sampling and analysis of the discharge.

We think we have seen compliance in New Jersey that we believe we would not have seen without these measures.

In addition, the Department adopted a uniform penalty policy in accordance with the act establishing exclusive criteria applied to determine the amount of civil administrative penalty assessment. The adoption of this policy ensures consistency in our penalty assessment among similar violations accompanied by similar circumstances.

This no-nonsense enforcement approach appears to have sent a clear message to the regulated community that penalty assessments are fair, not arbitrary, reflecting all relevant factual and legal considerations known to the Department, and therefore are litigation worthy. The greater certainty now associated with penalty assessment is to better facilitate settlement negotiations as well as successful litigation when penalties are contested.

The Department firmly believes that compliance is enhanced by establishing precisely defined requirements and clearly articulating the way in which compliance is measured by the Department. We are here today to offer our experience implementing the New Jersey act.

In conclusion, our enforcement philosophy is fair but firm with compliance as the primary goal. The DEP strongly supports any Federal action to reauthorize the Clean Water Act that incorporates the same processes and goals of New Jersey in the Federal act.

Senator GRAHAM. Thank you very much, Ms. Dooley.
Mr. Ed Lloyd?

**STATEMENT OF EDWARD LLOYD, GENERAL COUNSEL, NEW
JERSEY PUBLIC INTEREST RESEARCH GROUP**

Mr. LLOYD. Thank you, Mr. Chairman.

I would like to thank you for holding this hearing and for taking the time today to listen to our views on these important issues.

We would like to first commend Senators Baucus and Chafee for introducing S. 1114. It goes a long way toward improving the enforcement under the Clean Water Act, specifically with respect to citizen suit provisions which attempt to remedy the problem created by the Supreme Court decision in Gwaltney—and I am going to come back to that because we think it needs to go further—in addressing the question of when a State can preclude citizen and Federal Government enforcement, which the bill does, and in removing the provision allowing that a single operational upset be considered one violation instead of many violations.

We would also like to commend Senator Lautenberg and the State Department of Environmental Protection in New Jersey for urging this committee—and I want to join in those requests—to use the act that was passed in New Jersey unanimously as a guide to help us bring the beneficial provisions of that act into Federal law.

We are working with Senator Lautenberg to develop a bill to do just that and hope to have that bill before this committee.

There are two major provisions that Ms. Dooley touched on that I would like to expand on a bit in the New Jersey law that we think are critical and ought to be part of the Federal law. The first is the mandatory minimum penalty provision. The mandatory minimum penalty, in certain instances where there are serious violations, as those violations are defined in EPA regulations, requires a mandatory penalty for those violations. It sends a signal to the regulated community that there is the certainty of a penalty and we have had remarkable success with it in New Jersey.

I have appended to my testimony the executive summary of the second annual report of the New Jersey Department of Environmental Protection under the act. It shows that under the act compliance is up and penalty assessments—perhaps surprisingly—are down. I think that is a good sign. We want more compliance. When we talk about effective enforcement, we are looking for increased compliance and not necessarily increased penalties. That is what we have seen under the New Jersey act.

Just to throw out a few figures from that report, between 1991 and 1992, when the act was in effect, there has been a 36 percent reduction in unacceptable ratings based upon inspections of facilities. There has been a 300 percent reduction in the failure to submit discharge reports from dischargers. There has been a 200 percent drop in violations related to DMR reporting.

The number of penalty assessments has gone up by 50 percent, but the average amount of assessments has gone down by 25 percent. Collected penalties are down 15 percent. Yet, a substantial number of penalties are still collected and those penalties are used to run the program in New Jersey.

So we think the New Jersey program with mandatory minimum penalties has been a very successful program in increasing compliance and reducing penalties. We would urge the Congress to incorporate those provisions into the Federal act.

The second provision in the New Jersey act that we think bears important lessons for us nationally is the question of economic benefit, which Senator Lautenberg elaborated on.

Just very briefly, we believe that if you don't, in assessing a penalty, take away the economic benefit from having violated the law, there is really no penalty at all. I think the best example I have heard of that is that if I am going to go out and rob a bank for \$10,000 and the penalty imposed upon me is a \$5,000 pay-back and that is the only penalty, there is no disincentive for me to go out again and rob that bank.

First, I may not get caught the next time. But even if I do, I am still ahead of the game. That is exactly what economic benefit is all about. In assessing a penalty, you must make sure that any profit the violator has made, that benefit has to be taken away. Then we start to talk about a penalty.

The other important reason for having economic benefit is in fairness to those who are complying with the law. To the competitors of that violator who have gone out and spent the money, they should not be placed at a competitive disadvantage for complying

with the law. So we think economic benefit is a critical component of the law and ought to be required in every penalty assessment.

Let me come back for a moment to some of the provisions in the act regarding citizen suits. As I mentioned, S. 1114 does address the Gwaltney problem, that is, allow citizens to sue not only for past violations but provides that we can sue for past violations only if they are repeated.

Let me suggest to the committee that the language, by requiring that the violations be repeated—I am afraid we may not be curing the Gwaltney problem. I think by requiring that it be demonstrated that the violations are repeated, we are going to generate perhaps as much litigation around what is a repeated violation as we have with respect to what are past violations. I am afraid there will be litigation about whether we have to show that the violations are repeated for every parameter that we seek a penalty on, that we must show they are repeated for every outfall we seek a penalty on.

I would encourage the committee to go further and further examine this issue and perhaps not include that language about “repeated” in the Act because I believe what we were doing was just changing the game to a different game, which will prevent enforcement from being certain and swift. If the enforcement is not certain and swift, I am afraid it is not going to be effective. I think we need effective enforcement.

With respect to standing, I think the Congress’ intent was clear when it enacted the Federal Clean Water Act in 1972 that citizens should have standing to the full extent allowed constitutionally. We think that some of the court interpretations have begun to limit the ability of citizens to bring these suits. We would urge that citizens should not have to demonstrate any more in showing they have standing to bring these suits than they do to find a violator liable for discharges.

The standard for standing should be no more difficult than the standard for liability. We would urge the Congress to incorporate such provisions in the bill.

Congressman Pallone has introduced a bill, H.R. 2727, which incorporates our recommendations, and we would urge the committee to examine that bill.

Thank you again very much for holding the hearing today. I am certainly happy to answer any questions.

Senator GRAHAM. Thank you very much, Mr. Lloyd.

Mr. Herman?

**STATEMENT OF STEVE HERMAN, ASSISTANT ADMINISTRATOR
FOR ENFORCEMENT, ENVIRONMENTAL PROTECTION AGENCY**

Mr. HERMAN. Thank you, Mr. Chairman.

If I might, I would like to say on a personal note that this is a particular pleasure for me to be here today for several reasons. Senator Lautenberg was kind enough to introduce me at my confirmation hearings. My parents still live in New Jersey and are great admirers of his.

For the past 5 years I have had the pleasure and privilege of working on the everglades litigation in Florida. Although my home

is here, my family thought I lived down there. I became well aware of all the fine work you have done with regard to the environment.

Mr. Marzulla was the assistant attorney general at the Justice Department when that lawsuit was filed. I attended Rutgers Law School. So I feel quite at home here.

[Laughter.]

Mr. HERMAN. I would like to commend Senators Chafee and Baucus for introducing the bill and you for holding these hearings.

I would like to highlight today several of the matters in the bill that we think are of particular importance. I will try to do that briefly.

With regard to the waiver of sovereign immunity in Federal facility enforcement, section 313 of the Clean Water Act should be amended to waive prospectively the United States sovereign immunity from penalties for all Clean Water Act violations by Federal facilities and to allow States to obtain penalties for violations of requirements in State laws that govern the control and abatement of water pollution.

We will need additional time to work with the committee staff on the details of this provision, but the committee amendment would parallel the policy of Federal Facility Compliance Act, enacted in 1992, which clarified the waiver of sovereign immunity under the Resource Conservation and Recovery Act.

The amendment to the Clean Water Act should not alter in any manner existing agreements, permits, compliance agreements, or administrative or judicial orders. Furthermore, the amendment should not affect existing provisions that Federal employees are not personally liable for civil penalties resulting from acts or omissions within the scope of their official duties. Federal employees but not Federal departments or agencies should be subject to criminal sanctions.

For effective enforcement at Federal facilities under the Clean Water Act and consistent with the Federal Facilities Compliance Act, Federal facilities should be subject to the same administrative compliance orders and penalties as non-Federal parties. The applicable department or agency should have the opportunity to confer with the Administrator before the administrative order becomes final.

By adopting the same enforcement scheme for Federal facilities under both the Clean Water Act and RCRA, actions can be more easily combined into one action, as appropriate, thereby simplifying enforcement for both EPA and Federal facilities and conserving scarce enforcement resources.

The bottom line is that the Federal Government wants to be treated the same as other parties and the Federal Government should comply with the law the same as other parties.

With regard to the administrative penalty cap, one of the great successes of the 1987 amendments to the Clean Water Act was the grant of administrative penalty authority to EPA. The result has been an increase in the overall level of enforcement activity. In addition, an administrative enforcement action requires only a fraction of the resources that are needed to bring a judicial case. We are examining with the Department of Justice possibilities for greater use of our Clean Water Act administrative enforcement

provisions with the goal of creating a more efficient, effective enforcement program.

The Clean Water Act should also be amended to provide authority for the agency to seek administrative penalties for violations of administrative compliance orders with appropriate due process protection for defendants.

With regard to citizen enforcement, citizen suits are an important component of the overall Clean Water Act enforcement effort. Unfortunately, the ability of citizens to maintain a suit under the Clean Water Act has been substantially eroded by the courts since 1987 when the Clean Water Act was last reauthorized. In particular, the United States Supreme Court in 1987 held that citizens could not seek penalties for wholly past violations of the act, but were limited to filing suits for ongoing violations of the statute.

In 1990, Congress clarified that citizens can file suits for past violations of the Clean Air Act. We strongly support the provisions of S. 1114 that would allow citizen suits for past violations of the act. The agency does not have the resources to enforce against every violator of the act. Citizen suits have augmented the Government's limited resources and have created an additional deterrent to non-compliance.

With regard to criminal enforcement, I would refer you to my submitted testimony. There are several provisions which we believe are in need of some technical adjustments. We are four-square for a very strong criminal enforcement program. We think the suggestions we make will tighten the provisions and enhance that effort.

Finally, with regard to the emergency powers provision, the ability to take action in response to environmental emergencies is a critical component of our agency's enforcement authority under all major statutes. However, the emergency authorities provided to the Administrator under the Clean Water Act are more restrictive than those provided under other environmental statutes.

The amendments to the emergency powers provisions proposed in S. 1114 will largely meet the agency's concerns. Very briefly, we would like to be able to initiate administrative actions rather than having to go to court for a preliminary injunction or a temporary restraining order. We think there should be an emergency action permitted when there is a threat posed to the environment and not just to public health. We believe the act should explicitly provide that the emergency powers provision applies to any person and not just to those presently identified in the act.

Also, the Clean Water Act should be clarified consistent with other statutes, such as RCRA, to allow EPA to invoke the Clean Water Act emergency provision when the discharge from a pollutant source may present an imminent and substantial endangerment and not just "is presenting".

The improvements to the enforcement provisions that have been made by previous amendments to the Clean Water Act have enhanced the agency's ability to undertake a fair and effective enforcement effort. Adoption of the suggestions I have outlined today and those set out in my written testimony would again improve our enforcement capabilities and assist us in doing the best job we possibly can.

I appreciate this opportunity to present the agency's views and I look forward to your questions, Mr. Chairman.

Thank you.

Senator GRAHAM. Thank you very much, Mr. Herman.
Mr. Roger Marzulla?

**STATEMENT OF ROGER MARZULLA, PARTNER, AKIN, GUMP,
STRAUSS, HAUER & FELD, WASHINGTON, D.C.**

Mr. MARZULLA. Thank you, Mr. Chairman.

I am indeed honored to appear before this subcommittee today. I believe I was added to the panel for diversity because, alas, I have never lived in New Jersey.

[Laughter.]

Senator GRAHAM. Mr. Marzulla, looking at you, you seem to have an extended life expectancy ahead of you with opportunities to redeem you still available.

[Laughter.]

Mr. MARZULLA. I shall look forward to that.

Let me also note for the record, Mr. Chairman, that I am not appearing on behalf of any of my clients or clients of my law firm, but I was invited here—I think—to offer such benefit of the experience as I may based upon my having served, if you will, both sides of the table, as a prosecutor and enforcer of the environmental laws, including the Clean Water Act. During my service in the Environment and Natural Resources Division of the U.S. Department of Justice from 1983-1989, and now as head of the Environment Law Section in the Washington, DC office of Akin, Gump, Strauss, Hauer, and Feld, L.L.P., I defend such cases brought against my clients.

Fundamentally, it is my view that the Clean Water Act is the greatest success story among the major environmental statutes. This is due in no small part to aggressive enforcement of that statute. In point of fact, those entities which comply with the Clean Water Act want a level playing field. They want to see that the act is going to be enforced fairly and across the board so that there will not be cheaters and so that there will not be an opportunity to profit from failure to comply with the act.

For that reason, I join Mr. Herman in his suggestion that the focus on smaller cases be handled through the field citation proposal through the increase of administrative penalties which may be awarded precisely in order to free up resources of both government enforcement agencies and the resources of private industry to focus on major and stubborn issues of non-compliance.

Let me pass, then, to the citizen suit provisions of the Clean Water Act and suggest perhaps a slightly different perspective from that of Mr. Lloyd.

Citizen suit provisions of this statute are more wide open than their brethren in the Clean Air Act. Those citizen suit provisions allow for the recovery of attorneys fees by environmental groups whom bring cases. Those attorneys fees are allowed to be recovered at the rate of private law firms even when the suit is prosecuted by modestly—compensated environmental group lawyers. Moreover, the Clean Water Act permits, and this bill would allow in even

broader terms, environmentally beneficial projects in lieu of penalties for violations. Beside depriving the U.S. and State treasuries of funds, these projects often represent the individual whims or hobby horses of the entities which brought the cases.

The cases that are generally concentrated upon by citizen suit actions are not the difficult ones, but are the simple ones, the slam dunk cases in which the entity has already reported non-compliance. The non-compliance is not an issue, so the only question is the amount of penalties and/or the amount of environmentally beneficial project that is to be created.

The result is that the resources of the Government—both the Environmental Protection Agency and the Department of Justice—are diverted to the examination of those ongoing actions, both at the outset to see whether they are meritorious and thereafter, to examine consent decrees for compliance with governmental standards. And the resources of individual companies are once again diverted to what may not be major priorities under the Clean Water Act.

Moreover, the large groups who bring those cases—usually Washington-based—tend to have their own alternative agenda to that of the government agency, both State and Federal. Indeed, the only reason for bringing a citizen suit is because the Government has declined to bring that very action.

With that background, then, I suggest that it is not an enhancement of the citizen suit provision to allow the bringing of actions for wholly past violations of the statute. The Gwaltney opinion found Congress to have accomplished sound public policy: to provide that litigation under the Clean Water Act ought to be addressed at current, persistent, ongoing violations, or violations which are capable of repetition, and that the resources of all concerned ought not be spent upon addressing wholly past violations where those violations have no ongoing opportunity to impact upon the environment.

Note, of course, that the Government can bring cases for wholly past violations and can, of course, recover those penalties.

Second, the Congress correctly addressed the question of environmentally beneficial projects in the Clean Air Act Amendments of 1990 by limiting the amount of a penalty that could be expended or allocated to such projects. I suggest a similar cap for the Clean Water Act.

Fundamentally, the statute allows for injunctive relief and it allows for the assessment of penalties. Penalties are intended for punishment. That makes sense. Environmentally beneficial projects often minimize the sting of those penalties and they divert funds from the appropriate allocation to the Nation's Treasury.

I would just like to note in closing two other provisions of concern. One is the open-ended reference to restoration of natural resources. The statute has thus far provided ample authority for addressing the contamination that has been created by violations of the Clean Water Act and it is my concern that the use of this kind of open-ended liability circumstance in effect turns the Clean Water Act into another Superfund which will be litigated over the next several years as to what the standard of liability is, what the reach of the natural resource damage is, what kind of restoration

is important, what are the appropriate remedial actions, and so forth.

And finally, as you do explore the civil and criminal penalty provisions, as Mr. Herman mentioned, I suggest that the Congress may wish also to focus upon the failure to provide any guidance, either to industry or to Government, as to which cases ought to be brought civilly versus which ought to be brought criminally. In fact, most civil violations of the act may also be prosecuted criminally creating, I think, an uncertainty with respect to appropriate deterrent.

Thank you.

Senator GRAHAM. Thank you very much.

I would like to start the questioning with the comments that Mr. Marzulla just made relative to citizen suits.

The current judicial restrictions, as several of the witnesses have stated, limit the use of citizen suits to currently ongoing violations. The proposal in this legislation would extend that to some past violations.

What have seen the practical consequences of this restriction on citizen suits to the ability of violations to be identified and remediated? What effect has it had, Mr. Herman, on the actions of the EPA through its agency enforcement?

Mr. HERMAN. Our view, Mr. Chairman, is that citizen suits complement and enhance our own program and that they are an essential part of the program. Our view is that given the diminishing nature of our resources and the great extent of area to be covered in terms of inspections and enforcement, that neither we nor the States are fully capable of handling the entire load. In fact, if you review the docket of citizen suits, my own view is that they have made an extremely salutary and constructive contribution to the development of the Clean Water Act.

There are many very, very significant cases that have been brought over the years. I would say that to the extent that past violations have resulted in, for some reason, lack of action by the Federal Government or by the State government that the same purpose for which you would allow the State or Federal Government to take an action would justify allowing a citizen to take that action.

Senator GRAHAM. Any other comments on that statement?

Mr. LLOYD. Mr. Chairman, I believe that by not allowing citizens to sue for past violations, you are really allowing those violations to go unpenalized. I think that is against the intent of Congress and defeats the purpose of trying to create the level playing field.

The problem the *Gwaltney* case has created is that it has encouraged a whole new set of motion practice in Federal court in these cases where it has totally wasted the resources of both the citizen groups and the defense bar. It has certainly made a lot of lawyers much richer than they otherwise would be, but I don't think that is what we want in an enforcement scheme. I think we want swift, certain and effective enforcement.

We would support a provision in the bill that allows citizens to sue for those past violations. As I indicated in my opening statement, I think we have to focus on the question about repeated vio-

lations as well because I am afraid that will set up a new kind of motion practice that could be just as time consuming.

I think we need to work on that language somewhat to clarify it if we can.

Senator GRAHAM. Mr. Marzulla's testimony indicated the sense that citizen suits might distort the enforcement priority, focusing on a violation that might be of a relatively lesser nature and in some ways creating political or other public pressures on EPA to take enforcement where it might otherwise have not found that to be necessary or appropriate.

Could you comment on that potential distortion?

Mr. LLOYD. Certainly, Mr. Chairman.

I frankly don't think there is a distortion. The complaints that citizens file must be filed with the Department of Justice and with EPA. So there is an opportunity for them to review them.

Frankly, I am not aware—maybe Mr. Herman is in a better position to answer this—I don't think there are many staff people, if more than one, devoted to that issue. In fact, I think what citizen suits do is allow EPA to direct their resources to other concerns. The citizen suits are bringing effective enforcement. I think there is no question about that. I don't think we are directing or misdirecting Government resources.

The other role the Government would have in citizen suits is to review consent decree settlements when they are consummated in these cases. Again, EPA and the Department of Justice routinely file one set of what I would call boiler plate comments with the Federal district judge saying, "This is our position in general," and then sometimes they file additional comments on the specific provisions of the consent decree.

I think that is probably an appropriate role for Government, a limited one, and one that does not take an inordinate amount of resources at all.

Senator GRAHAM. Mr. Marzulla?

Mr. MARZULLA. Mr. Chairman, may I expand on the point I tried to make in my testimony?

Although I would not disagree with Mr. Herman that citizen suits have played an important role—the vast majority of those suits do not focus on the hard issues. Moreover, the principal concern, from the point of view of those who are the targets of these suits, is that the privatizing, if you will, of enforcement results in two sets of standards for approaching cases, assessing penalties, determining economic harm, and other factors: one set of standards for EPA, and another set of standards for private groups which have no accountability, and which may be different than government standards, and may enforce entirely different rules.

That is my concern, that there is no appropriate dividing line between that which Mr. Herman is doing at EPA and that which Mr. Lloyd is doing with citizen suits. To say that they are basically interchangeable and that either of them can bring the suit and it is really the same thing is sort of like saying that not only can the policeman issue a speeding ticket but that any citizen can also issue that same traffic ticket.

Senator GRAHAM. Mr. Herman, and then my time is up.

Mr. HERMAN. My own view is that the citizen suits really allow us to cover a broader spectrum of cases. EPA cannot do it all. To the extent that we can concentrate on larger, more systemic matters, that is a great advantage. To the extent that citizen suits hone in on some more local matters, I think that is a great advantage to those communities.

I would say that the citizen groups are subject to all the oversight that courts have. If the suit is frivolous, it will be thrown out. If they do not prevail, their attorneys will not get attorneys fees. EPA does review and the Justice Department does review settlements. We do comment on whether or not the economic benefit or whatever other penalty is being assessed is appropriate.

I really don't have the sense that the citizen groups and their suits are really off the reservation. I think they are very much in the mainstream of the area.

Ms. DOOLEY. I would just like to echo Mr. Herman's comments that hasn't been our experience in New Jersey that these suits are frivolous. We work hand in hand with the citizens bringing the citizen suits on many cases. We haven't found the suits to be frivolous or to focus on areas that are unimportant.

I don't want to leave an impression that because we are taking some actions no others are important. We do have limited resources.

Senator GRAHAM. Senator Lautenberg?

Senator LAUTENBERG. Very briefly, Mr. Chairman, I want to thank the witnesses.

And Mr. Marzulla, don't feel deprived, not having spent part of your life in New Jersey. There is still hope, there is still opportunity, and I promise you a personal welcome when you arrive.

[Laughter.]

Senator LAUTENBERG. Mr. Chairman, New Jersey having had the industrial concentration that it had caused us a lot of problems, also because we are the most densely populated State in the country, we wanted to correct those problems as quickly and as efficiently as we could.

Your very beautiful State, Mr. Chairman, despite relatively speaking wide open spaces, has had a problem with its management of one of the great national resources, the Everglades, and is hard at work to try to correct the problems there. All of us have a stake.

Again, New Jersey is a State with a great environmental concern. Thus, Mr. Chairman, I came from the corporate world right to the Environment Committee because it was I believed—and I think the citizens of New Jersey share my views—this is the place where we can get things done that will affect not only the quality of life in New Jersey but throughout our country.

I would just like to be sure that we are not at odds on this citizen suit action. I heard Mr. Herman's response and Ms. Dooley's response to Mr. Marzulla's comments that citizen suits somehow or other pick up where Government fails to make its case known and take the action. Do I correctly characterize your view, Mr. Marzulla?

Mr. MARZULLA. My suggestion was certainly that there are appropriate circumstances for citizen suits. I have not suggested that in all circumstances they are inappropriate.

Senator LAUTENBERG. And we have heard from Mr. Herman and Ms. Dooley. I just wanted to make sure that the record reflected a fairly clear view about that. There may be shades of difference.

Would anyone disagree with the fact that penalties ought to recover any economic benefit derived from a violation?

[Chorus of noes.]

Senator LAUTENBERG. Mr. Herman, what has EPA done to respond to the IG's 1991 report that EPA wasn't recovering the economic benefit from violators?

Mr. HERMAN. Senator, that report, as I understand it, found that the recordkeeping penalty was very, very inadequate on that. We have a policy at headquarters with regard to civil judicial cases that requires the recovery of economic benefit. We are seeking to ensure that is done.

We are also encouraging the regions in their administrative cases to recover the economic benefit at a minimum.

Senator LAUTENBERG. Is it fair to say that EPA has developed the criteria for determining economic benefit, which can be put in place fairly quickly?

Mr. HERMAN. EPA has an economic benefit model which is applied and available and which we use to judge various settlements, penalty assessments that we either develop or that come to us.

Senator LAUTENBERG. States have similar models? Does New Jersey?

Ms. DOOLEY. New Jersey is attempting to develop a rule on its own economic benefit model. We started a round table approximately a year ago with environmental groups, industry, members of the legal community, and the department to come up with an economic benefit model for New Jersey. Right now, it is very similar to the model that EPA uses, but we do have two major differences in terms of company-specific return on equity, in terms of what we're using now on a case-by-case basis. We don't know what our eventual rules will look like. We plan to propose something in the fall.

Senator LAUTENBERG. Mr. Herman, should there be more opportunities for measurement of economic benefit than simply EPA? Or should EPA with its far larger resource than any of the States try to develop a yardstick or a means of measurement on economic benefit that would be uniform throughout the country?

Mr. HERMAN. Senator, our relationship with the States I think is very, very important. I think having consistency between EPA and the States is very important both for us and for the regulated community and for the public at large.

My hope and my intent would be to reach out to New Jersey and to other States with regard to the work on an economic benefit model so that we can have as much consistency as possible. This seems like the kind of thing that we should be able to reach some consensus on so that everybody knows where we stand.

Mr. LLOYD. The EPA model is the model the citizens use in our lawsuits as well and seek to ask the judge to impose penalties

based upon that model. We are working with the State of New Jersey on their regulations.

I think it is important to go beyond just the model, though, and it would be very helpful both on the Federal level and the State level to have a uniform regulation in effect that says, "Here is the model, here is the data we need to put into the model, here is how we are going to collect it," so that when enforcement actions are taken—whether they are administrative, judicial, by State, Federal Government, or citizens—that is all in place.

One thing it would do, I believe is that—one of the things that is litigated now in both the citizen suits and the other enforcement cases—we litigate over what goes into the model and what the factors are. If we have a uniform policy that lays all that out, we can cut down on that litigation and enhance the ability to enforce at all levels.

I would encourage the promotion of such a uniform policy and detailed policy.

Senator LAUTENBERG. One of the things that I find particularly onerous and difficult to deal with is invitations by various States to attract businesses, to retain businesses based on different environmental standards. It is just the worst kind of competition for economic investment. Wherever possible, I would like to see uniform standards for making judgments on conforming or enforcement of law. It is not fair to the citizens of the State that is making an invitation for them to close their eyes to violations of Clean Air or what have you.

I would like uniform standards all across the country so that we are all dealing with the same material.

Mr. HERMAN. Senator, if I just might for one second—we are taking steps at EPA to try to require States to recover economic benefit from violators. Earlier this month we issued final revisions to the 1986 policy framework for State/EPA enforcement agreements. The revisions set the recovery of economic benefit as a minimum goal in State enforcement cases.

I think that addresses your final point. Then I would reiterate that we would want to work with the States to come up with a common model.

Senator LAUTENBERG. Mr. Chairman, I thank you very much. I thank the witnesses for the opportunity to have this exchange. I may submit a few questions to our witnesses for the record.

Thank you very much.

Senator GRAHAM. If I could follow this line of questioning that Senator Lautenberg initiated relative to economic benefit recovery, there are several places in the current law in which there are caps generally expressed in fines per day or some other similar method on what can be recovered, whether it is administratively or through injunctive relief.

Do you find those penalty caps to be inconsistent with the goal of full recovery of economic benefit?

Mr. HERMAN. In some cases, they may be, Mr. Chairman. They also have several other effects. With regard to the cap on administrative proceedings, that forces cases in many cases into court which otherwise could be handled and disposed of at less expense to the regulated community and less expense to the Government.

We are going to work with the committee and with the Justice Department on trying to rectify that.

With regard to the cap that I believe is being proposed in the legislation with regard to the value of injunctive relief that might be ordered for natural resource damage, there especially in the a of the Clean Water Act that may result in insufficient recovery to cover the damage that was done.

You might have a spill which took place on one day which did terrible, terrible damage, but the maximum fine might be \$25,000. We would urge the committee to review that and to provide for a recovery of the economic benefit and the cost of repairing the damage.

Senator GRAHAM. Mr. Marzulla, do you have any comments on the proposal to eliminate or decrease the amount of the maximum penalty cap?

Mr. MARZULLA. As I indicated, Mr. Chairman, with respect to the administrative penalty cap—I think that makes a good deal of sense. The \$50,000 cases ought not be brought in Federal district court, but should be handled instead by field citation. Just how high that number should go is not entirely clear. I don't know whether Mr. Herman suggests that it ought to be a higher number. Still, it does make a good deal of sense to dispose of relatively minor cases administratively.

With respect to the so-called natural resource damage injunctive power, as I indicated—I find that provision troubling in part because it implies that such power has not heretofore existed when in fact there are many consent decrees in which the Justice Department and EPA have used their injunctive power to require that contamination resulting from acts by the defendant be cleaned up.

I am not sure what natural resources authority adds. I am fearful, as I suggest in my written statement, that because it harkens back to the natural resource damages provision in CERCLA that in fact it is going to be seen as some sort of massive new authority and it is going to end up in a great deal of litigation.

Senator GRAHAM. Any other comments on this?

Mr. Lloyd?

Mr. LLOYD. Mr. Chairman, just with respect to the cap in the statute.

We had at least one case in New Jersey where the maximum statutory penalty was lower than the economic benefit. The judge assessed the maximum penalty, but the result there was perverse in that the penalty was lower than the economic benefit. Therefore, even though the courts assessed the maximum penalty, the violator had benefited.

So I would ask the committee to consider an exception to that cap where economic benefit exceeds the statutory maximum to allow the penalty to go up to at least the economic benefit. Of course, if it is just at the economic benefit, there still has been no penalty, but at least we have recovered the benefit.

Senator GRAHAM. Any other comments on this issue?

There are two other questions I would like to cover before I have to leave for this vote, at which time we will adjourn the hearing today.

One is the issue of civil or criminal penalties for beneficial mitigation of a project. There is a proposal that the courts be given the discretion as to whether to direct the penalties to a mitigation fund or as currently to the Federal Treasury.

Any comments to that proposal?

Mr. LLOYD. Mr. Chairman, we certainly support that proposal. We have had fairly good success with those projects in New Jersey. I have to take exception to some of the things that Mr. Marzulla said earlier. Frankly, in my experience—and I have been involved in some 60 cases in New Jersey and am aware of other cases elsewhere—it is not the plaintiff that determines the project. In the negotiations we have had it has been a joint determination. Those projects are, of course, ultimately reviewed by a Federal judge. They are also reviewed by the EPA and the Department of Justice.

I think that they are not pet projects, if you will, of the plaintiffs. In fact, it is often that the defendant will come up with a project and the plaintiff will accept it.

So I think they are appropriate and helpful. We have had cases where we have had money go directly to the New Jersey Department of Environmental Protection for their water program. We view this as sort of getting a double benefit. You get a penalty and you get a beneficial project.

With respect to one point that Mr. Marzulla made, let me agree with him. It is our view of the law that money paid to these projects is not tax-deductible to the company paying for the project. Perhaps the best way to clarify that is an amendment to the Internal Revenue Code that makes it clear that mitigation projects paid for either in a settlement or court-ordered judgment are not to be tax-deductible. We certainly don't want to see tax deductions for mitigation projects that result from enforcement actions.

That may cure at least one of the problems that Mr. Marzulla has with these projects.

Mr. HERMAN. Mr. Chairman, I would like to comment on two things.

One is that the pending bill, S. 1114, does not have a minimum cash penalty along with the supplemental environmental project. We think that it must. It has to provide for at least the cash recovery of economic benefit.

Second, we think that the nexus between the violation and the supplemental environmental project possibly should be broadened some to cover multimedia problems at the facility—in other words, if there are both air and water problems, even if it is a water case, that you could address the air problem also. If there are other facilities owned by the same company that have the same problems, they could be addressed with this. But we think that supplemental environmental projects can be extremely constructive.

We do not favor, however, setting up a separate fund into which the penalty money would go. We think it should go to the Treasury.

Mr. MARZULLA. Mr. Chairman, to return to the issue that I raised in my initial testimony—an environmentally beneficial project is less valuable as a deterrent and an enforcement program than is a monetary penalty. It strikes me as rather unique to view the citizen suit provisions of environmental statutes as part of a

governmental enforcement program which imposes penalties if those provisions can be used to decrease the penalties—perhaps well below the economic benefit, for example—in return for performing some so-called good act.

It is too often the case in these cases to start off by saying, “OK, the penalty is \$1 million. How much of this can I put into a project?” Then the question is, “What is the project?” I have seen projects that involved creating parks, creating an environmental Chair at a university, dedicating money to teach people how to do water testing, and so on and so forth, some of which may be valuable projects.

But when you start with the notion, “Let’s decrease the penalty and substitute something else,” it seems to me that the question is, “Why? How does that fit into an enforcement program?”

Senator GRAHAM. I apologize, but I am going to have to leave.

Ms. Dooley, we would like to receive your comments on this. I am going to ask Mr. Leary, however, to assume the Chair and then he will have at least one other question he would like to ask. At the conclusion, we will adjourn the hearing.

Again, I wish to thank all of you who have participated so generously. I apologize that democracy is not a smooth-running operation, at least in the United States Senate. We have had these disruptions and I particularly appreciate your understanding and cooperation under those circumstances.

Thank you very much.

Mr. LEARY [resuming Chair]. Ms. Dooley?

Ms. DOOLEY. I guess I am a little confused by the comment. It hasn’t been my experience that a beneficial payment for a beneficial project is somehow less of a deterrent than payment of a penalty. I think they go hand in hand. Again, we have gotten some of the projects in New Jersey through money being used for these projects through citizen suits.

Mr. LEARY. The only follow-up question I had with respect to that was something that again Mr. Marzulla raised in his statement, which was that funds that go into these beneficial projects are funds diverted from the Treasury. I believe EPA’s statistics showed in excess of \$9 million over 4 years going into the U.S. Treasury. One doesn’t know how much that might detract from that.

The only question I had has been touched on in your opening statement. We took a lot of comments in your opening statements regarding minimum mandatory penalties. The only thing I didn’t have that I wanted on the record, Mr. Marzulla, was your reaction to the concept of minimum mandatory penalties.

Mr. MARZULLA. It depends, of course, on what the amount of the minimum mandatory penalties are, Mr. Leary.

The concern that I have about those numbers is that—to the extent that you tie the hands of a judge and require the imposition of an amount which may be inappropriate in the case of a bankrupt company, where in fact you end up taking the money out of the pockets of creditors rather than punishing the violator—in those marginal circumstances there ought to be some opportunity for the judge to depart from those penalties. That is not unlike the

authority to depart from sentencing guidelines with respect to crimes.

Mr. LEARY. If there are no other comments, on behalf of the subcommittee, I thank you all for being here. We may be submitting additional questions.

The hearing is adjourned.

[Whereupon, at 6:05 p.m., the committee was adjourned, to reconvene at the call of the Chair.]

[Statements submitted for the record follow:]

TESTIMONY BY BLAKE P. ANDERSON, DIRECTOR OF TECHNICAL SERVICES
FOR THE COUNTY SANITATION DISTRICT OF ORANGE COUNTY

INTRODUCTION

Mr. Chairman and members of the Subcommittee, I am Blake Anderson, Director of Technical Services for the County Sanitation Districts of Orange County, California. I appear before you today representing the Association of Metropolitan Sewerage Agencies (AMSA). AMSA's members represent the nation's largest wastewater treatment agencies. We serve the majority of the sewered population in the United States, and collectively manage over 14 billion gallons of wastewater each day.

AMSA had the honor of testifying before the Subcommittee on June 23rd of this year. In that testimony, we addressed the issues of funding, combined sewer overflow control and stormwater management, and provided an overview of the significant role AMSA believes comprehensive watershed management should play in the reauthorization of the Clean Water Act.

AMSA is pleased to be here today to provide our perspective on the reauthorization of the Clean Water Act and the Water Pollution Prevention & Control Act of 1993,

S. 1114. We sincerely appreciate the opportunity to share our thoughts and recommendations as environmental practitioners dedicated to protecting and improving the quality of the nation's waters.

AMSA supports the reauthorization of the Clean Water Act and its goal of fishable and swimmable waters. AMSA believes that this reauthorization must use an integrated and comprehensive strategy that establishes new priorities for achieving water quality goals. The reauthorized Clean Water Act must recognize the wide range of conditions present in our nation's watersheds and provide flexibility to decision makers so that they can address site-specific conditions. It must target all impediments to ecosystem health. It must develop mechanisms for control that properly balance environmental gains and their cost-effectiveness. And it must provide the funding to implement its clean water mandates.

From our initial review of S. 1114 we believe that the Senate legislation goes a long way toward realization of these goals. Many of AMSA's concerns and priorities are present in the bill and reflected in its language. We commend Senators Baucus and Chafee for introducing legislation that clearly moves our national clean water program forward.

In previous testimony, AMSA has enumerated its perspectives by focusing on three overarching concepts: 1) putting the reauthorization into perspective; 2) reconciling our constraints, our expectations and our needs; and 3) the search for a solution. My remarks today will touch briefly upon each of these concepts, but focus primarily upon our collective search for solutions. AMSA believes a national program of comprehensive watershed management is the most effective way to protect our nation's 20 year investment in clean water, and allow us to successfully respond to the next 20 years of water quality improvement.

Putting the Reauthorization into Perspective

First and foremost, it is important to put reauthorization of the Clean Water Act into an historical perspective. This nation, its states, cities and towns have made enormous progress in the more than 20 years since the passage of the 1972 Clean Water Act.

In 1972, national standards that targeted point sources made sense because we had identifiable problems traceable to readily controlled sources. Congress provided funding, necessary deadlines and enforcement mechanisms. Coupled with a considerable amount of public support and motivation, this set the stage for our nation to successfully address many of its clean water challenges. As a result, upgraded municipal wastewater treatment facilities and source control of industrial wastewater

have significantly reduced the discharge of pollutants from point sources to the nation's waters.

Today we face new challenges. While public support for environmental progress and improvement continues, the new and emerging issues we must address are more complex and costly. Nonpoint source pollution remains a continuing problem. The control of combined sewer overflows, the management of stormwater and managing agricultural sources of pollution provide excellent examples of new clean water priorities. Today, budget shortfalls at every level of government are unprecedented, which make dollars harder to get.

Reconciling our Constraints, our Expectations and our Needs

In a reauthorized Clean Water Act we need to reconcile the constraints of the 1990's with our continued high expectations and the need to make continuing progress. Reconciling constraints with expectations within the context of the Clean Water Act will involve several things, the first of which is an increased and ongoing Federal financial commitment, in partnership with state and local governments.

The next step in this reconciliation is for all of us to refocus our concerns and priorities. We need to determine where problems still persist, establish priorities, use site-specific solutions, set realistic deadlines and maintain flexibility to solve local problems. Prescriptive national solutions do not, by their nature, provide the level of flexibility needed to consider site-specific circumstances and cost-effectively attack our priority problems.

I have talked to many interests around the country and I believe there are seven major themes that are consistently heard from Congress, EPA, environmental groups, and my colleagues throughout the nation. Here are the seven:

1. We need better science and field data for developing water quality objectives.
2. We need to manage nonpoint sources of pollution.
3. We need to use site-specific management techniques.
4. We need multi-agency cooperation.
5. We need to use nontraditional approaches to solve today's continuing water quality problems.
6. We need public involvement and stewardship to protect our watersheds.
7. We need national leadership, not national command and control.

The Search for a Solution

There is a very important temptation that we—as a nation—must resist. I speak of the propensity to attempt to fix programs that aren't broken. The Clean Water Act is possibly the nation's most effective environmental statute—a real legislative success story. AMSA was gratified to see that approach taken by the drafters of S. 1114 reflects an appreciation of the solid foundation, provided in the Clean Water Act, upon which to build. The Committee and staff are to be commended.

The recognition demonstrated in S. 1114 to fine tuning many long standing programs, as well as the need to focus attention on important areas such as pollution prevention, water conservation and, of course, comprehensive watershed management offers an excellent basis for discussion and evaluation. While AMSA will have constructive recommendations to improve and strengthen the bill, the legislation represents a significant step forward.

AMSA believes the solution for which we search is comprehensive watershed management. Comprehensive watershed management is our best opportunity to address water quality into the next century. In its ideal form, comprehensive watershed management puts all the people together who can properly plan, execute, enforce and pay for a plan, places local interests in a co-partnership with State and Federal agencies, and provides the flexibility and accountability necessary to customize a watershed plan.

COMPREHENSIVE WATERSHED MANAGEMENT

Support for a National Program of Comprehensive Watershed Management

AMSA, the U.S. Conference of Mayors and many other national organizations view a national program for comprehensive watershed management as the best way to effectively integrate successful Clean Water Act programs and ensure that limited resources will result in continued environmental improvements. Our Association spent much of the last two years coming to one clear conclusion—that comprehensive watershed management, as a means to achieve our national water quality goals, makes a lot of sense. AMSA was gratified to see, in provisions of S. 1114, that the leadership of the Senate Environment & Public Works Committee shares this significant conclusion.

Should the Subcommittee need additional support for establishing a national program of watershed management that is flexible and addresses site-specific conditions, AMSA offers the following:

Every watershed is unique. Picture if you will, the Florida Everglades; the deserts of the Southwest; the forests of coastal Washington; the Great Plains of the Midwest; the river valleys of Ohio; the Mississippi delta; and the New England states. Varying conditions abound in these regions of the country—each with different rainfall, temperatures and topography.

Sources of pollution are also unique—within each watershed, from region to region. For example, treated municipal wastewater comes from small midwestern towns and from large urban coastal areas like Los Angeles and New York. Our Nation's communities discharge their treated wastewaters not only into the Platte River—or the deep near coastal waters of the Pacific—or into the Hudson River, but also into the dry river beds of Arizona—into Long Island Sound—into the Mississippi River—into the Great Lakes—and into the fjords of Alaska. Every one of these areas and all the others you can possibly name have site-specific conditions that make them unique and nearly impossible to generalize.

We must also recognize that great tracts of this country are not metropolitan at all, but are instead rural and heavily agricultural. Here too, major differences abound. The dry wheat growers of eastern Washington, the sugar growers in the delta country of Louisiana, the cranberry growers in the bogs of New England, the corn growers of the Midwest and the cattle ranchers of Montana and Texas all have unique conditions and unique challenges. It's hard to conceive that there are water pollution control practices that could be applied equally and evenly to all of these farming activities.

The resources we must protect are significantly different from watershed to watershed as well. The unfiltered public drinking water supply of Portland, Oregon, the wetlands and estuaries of the Sacramento River delta, the fisheries of the Great Lakes and the crab fisheries of the Chesapeake—all require site-specific plans for protection and preservation.

It is based upon those realities that AMSA advocates a national program of comprehensive watershed management. Our vision, contained in AMSA's proposed legislation, the Comprehensive Watershed Management Act of 1993, calls for the development of comprehensive watershed management plans with the participation of all point sources, nonpoint sources, users of the watershed, citizens and levels of government. We have provided with our testimony our Principal Tenets that guided the development of AMSA's Comprehensive Watershed Management Act of 1993.

As we see it, the process for restoring watershed ecosystems follows rationally from a scientific analysis of site-specific conditions and the technologies available to improve those conditions. Priorities are established based on the quality and use of receiving waters, ecosystem health, and the sources of pollutants that legitimately threaten the watershed. AMSA believes that comprehensive watershed management planning must emphasize establishing priorities, maintaining flexibility and empowering local, regional and state government and the affected community-at-large to solve their unique problems.

Watershed Management in S. 1114—An Important Step in the Right Direction

Title III of S. 1114 expands existing authority for monitoring of waters, modifies the nonpoint source management program enacted in 1987, and establishes new procedures to comprehensively manage all sources of pollution in watershed areas. In this regard the legislation represents a significant step in the right direction. In particular, AMSA would like to comment specifically on several key concepts included in Section 321., Comprehensive Watershed Management, of the Water Pollution Prevention & Control Act of 1993.

INCENTIVES FOR WATERSHED PLANNING

MANDATORY VS. VOLUNTARY APPROACHES

AMSA strongly supports the incentives for watershed management planning contained in S. 1114. The incentives described in the legislation make as compelling as possible the voluntary implementation of watershed management.

AMSA would suggest, however, that in order to be truly effective, a national program of comprehensive watershed management must provide sufficient national leadership to ensure consistent implementation and evaluation of programs, while at the same time offering the maximum amount of local and regional flexibility. For

this reason, we believe that watershed management provisions, as an essential part of the Clean Water Act reauthorization, must be mandatory.

AMSA views a mandatory program as essential for two reasons. First and foremost, to facilitate the achievement of the goal of meaningful environmental benefits from water quality improvements, and secondly to define the specific components of a comprehensive watershed management program that is national in scope—and local in focus.

We recognize mandatory comprehensive watershed planning will be a large undertaking requiring careful allocation of limited personnel and monetary resources. Planning activities cannot start simultaneously and, for this reason, AMSA recommends the phased implementation of assessment and planning activities. A staged process would provide for the staggered initiation of watershed planning activities and will provide thus for the deliberate, measured initiation of the watershed planning process.

AMSA feels strongly that while the 20 years since the 1972 Clean Water Act have produced significant benefits, the future application of technology-based standards will not result in the same level of water quality improvements. Achieving tomorrow's water quality successes will be far more challenging and a change in our national paradigm is essential.

We must look at the next 20 years of water quality improvements from a new perspective. AMSA believes a shift in our collective approach to this issue must occur. While watershed management is ongoing in some areas of the country, and certainly possible in many others, it is only a national shift in our approach to addressing water quality issues that will provide the information and tools we need to truly make a difference in our nation's water quality over the next 20 years.

LOCAL GOVERNMENT DELIVERS—A BOTTOM-UP APPROACH IS ESSENTIAL

Comprehensive watershed management, in the context of the Clean Water Act, should offer a "bottom up" approach to achieving water quality improvements. S. 1114 moves in this direction by recognizing the need for "management entities". AMSA urges that the legislation go further in this regard by establishing Watershed Management Commissions. Such a Commission would provide the basis for the difficult decisions that must be made to protect and improve the watershed, to be made by those most closely involved—the stakeholders.

AMSA believes that local stakeholders must have a significant role on the Commissions. And special consideration should be given to those regional and local agencies within the watershed that now have, and will have, planning, implementation and enforcement responsibilities under the watershed management plan. This acknowledges the need for local interests to share in a partnership with State and Federal representatives.

At first glance, such a Commission could be viewed as "just another layer of government." However, AMSA would argue that it is the make-up and active participation of the Commission that makes the comprehensive watershed management concept truly effective. Today, there already exists multiple layers of local, regional, State and Federal agencies with varying jurisdictional responsibilities regarding a particular watershed. Often these agencies do not meet in a coordinated and systematic way to address the policy, operational, regulatory and financial issues of a watershed. The Commission would act as a "bureaucracy-buster" by providing the setting for these agencies to meet and to systematically address problem solving for the watershed. AMSA feels certain that the success or failure of watershed management will be determined by the type of institutional setting through which the process occurs.

MORE MANDATES . . .

OR A MOVE TOWARD AN INTEGRATED, COMPREHENSIVE APPROACH?

Headlines from across the nation decry both the need for environmental protection and the desire to keep costs at a minimum. In recent years, local governments—and in turn their citizens—have paid an ever increasing share of the clean water burden. In AMSA's needs survey, entitled "Cost of Clean", we found that local government currently provide 80-90% of total capital funding.

Environmental mandates have increased in both their number and cost, and Federal financial support of the nation's clean water program has diminished. Compelling national interests, not only environmental and public health, but economic, social and political, make necessary an aggressive and comprehensive effort to preserve existing water resources and restore polluted waterbodies and systems as rap-

idly as possible. This massive task means that we must intelligently and successfully target our clean water resources to give priority to the most serious problems and identify where we get the most environmental benefit for the least cost. This means first things first because if everything is a priority, then nothing is a priority.

We must use the reauthorization of the Clean Water Act to establish processes that will give the country an integrated and comprehensive strategy that establishes new priorities for achieving water quality goals. A national program of comprehensive watershed management will do just that.

As envisioned by AMSA, the concept of comprehensive watershed management integrates several other concepts which already exist in the Act. There are links to Section 402 permitting, Section 309 permit enforcement activities and Section 303 water quality standards, to name a few. We commend S. 1114's authors for establishing a new Section 321 in the Act, rather than proposing amendments to all related sections. Section 321 provides needed prominence for watershed planning and emphasizes the manner in which its provisions join together concepts already existing in the Act. As provisions in S. 1114 are revisited, AMSA calls upon the Subcommittee to make a serious effort to provide increased integration of Clean Water Act programs under the watershed management "umbrella".

In conclusion let me suggest the following:

AMSA believes that comprehensive watershed management should be the new foundation for the future direction of our Nation's clean water program. AMSA looks forward to working with you to broaden, strengthen and make more responsive, the watershed provisions in S. 1114. We hope to share additional recommendations via detailed written comments that we will provide to the Subcommittee in early August.

We need to consistently search for better ways of doing things—more flexibility and more attention to site-specific conditions, improved public awareness of our problems and solving our problems with the best solutions. Local consensus-building must become an essential step in the framework for reaching the environmental milestones we set.

In short, we must strive toward a better understanding of the most effective, and efficient, means through which we can accomplish our national clean water goals.

As we shift our attention toward fully restoring our watershed ecosystems, we all recognize that we have a long way to go. No one ever suggested that the task of improving and protecting the nation's waters would be an easy one—however, working together, I know we can succeed. With 20 years of success behind us, we can look to the next 20 years with confidence.

This concludes my testimony. I would be pleased to answer any questions you may have.

PRINCIPAL TENETS

AMSA's leadership adopted the following principal tenets to guide the development of the Comprehensive Watershed Management Act of 1993:

PRINCIPAL TENETS OF THE COMPREHENSIVE WATERSHED MANAGEMENT ACT OF 1993

ADOPTED BY AMSA'S BOARD OF DIRECTORS

FEBRUARY 4, 1993

1. The overall objective of comprehensive watershed management planning is to make cost-effective, site-specific decisions that achieve water quality objectives that protect the designated beneficial uses of a watershed.
2. Science must be the basis for public policy decisions.
3. All players must be at the table to equitably address future water quality objectives.
4. Local government and publicly-owned treatment works must have an active role in establishing water quality objectives for the watersheds in the which they are located.
5. Local stakeholders (government entities, sources of watershed impacts, users of the resources within the watershed, the public and others with a specific interest in how the watershed is managed) must have the clearly stated opportunity to provide recommendations and direct advice and counsel to the Governor regarding the designation of their watershed boundaries and the makeup of its Commission.

6. Progress on water quality improvement, including minimum standards of operation (MSOs), must continue as comprehensive watershed management planning moves forward. Until a watershed management plan is completed, permitting agencies that are responsible for National Pollutant Discharge Elimination System (NPDES) permits must take into account those sources within a watershed that cause water quality impairment and must accordingly exercise flexibility and discretion in exerting their regulatory authority in setting effluent limits and compliance schedules, and in conducting enforcement activities.
7. Time frames for completing a comprehensive watershed management plan must be realistic.
8. Implementation of elements of the comprehensive watershed management plan must be verified and enforced to assure equity among all sources or categories of sources of pollutants of concern in a watershed.
9. The scheduling of compliance with Clean Water Act requirements and prioritization of resources to achieve water quality objectives shall be guided by watershed plans. One expected outcome of an approved watershed management plan is that NPDES terms, conditions and limits shall be modified as appropriate to cost-effectively achieve the water quality objectives of the plan.
10. Comprehensive watershed management planning and the federal/state legislative and regulatory framework shall be compatible and fully integrated.

TESTIMONY OF CHARLES F. GAUVIN, PRESIDENT, TROUT UNLIMITED,
VIENNA, VIRGINIA

Mr. Chairman, members of the Subcommittee, I appreciate the chance to appear today to give you Trout Unlimited's (TU) comments on S. 1114's watershed planning and management provisions. TU is a national coldwater fisheries conservation organization of over 70,000 members in 435 chapters nationwide. Dedicated to the protection and restoration of trout and salmon resources, TU is vitally concerned with improving water quality and protecting and restoring aquatic habitats. Improving and strengthening the Clean Water Act (CWA) through the current reauthorization process is one of our highest priorities.

Let me start by saying that, if the great effort which this Committee undertook in drafting the original Clean Water Act had gone just a step further and addressed our nation's water quality problems on a watershed-wide basis, I would not be here today. The 92nd Congress, under Senator Muskie's able direction, correctly realized the task before it when it set out to restore and maintain the chemical, physical, and biological integrity of our nation's waters. Unfortunately, however, it did not provide the federal and state agencies with sufficient direction to accomplish that task. As a result, despite considerable improvement in the chemical and physical integrity of our nation's waters, our estuaries, lakes, rivers, and streams remain in the throes of a biological deficit.

When I use the term "biological deficit," I refer to situations such as the following:

- An estimated 106 Pacific salmon stocks (locally adapted populations that are reproductively isolated) already have gone extinct and scores of others (an estimated 214 stocks) are in jeopardy of extinction throughout the range of their habitat in the Pacific Northwest¹;
- six other native salmonids are threatened or endangered throughout the Intermountain West; and
- In all, a recent study found that one-third of all our native freshwater fish species are threatened or endangered, and one-fifth of *all* our aquatic species are now threatened².

In totality, this amounts to a potential loss of unprecedented and unconscionable biological, economic, social, and cultural dimensions. For even though our waters are degraded in many areas, they still yield considerable bounty: in 1990, fish caught in U.S. waters exceeded \$3.5 billion in direct dockside value, and served as the base of a processing and sales industry generating \$26.7 billion in consumer expenditures; in 1991, freshwater recreational fishing exceeded \$15 billion dollars while saltwater recreational fishing contributed close to \$5 billion; and according to

¹ Nehlsen, W., J. E. Williams, and J. A. Lichatowich. 1991. Pacific salmon at the crossroads: stocks at risk from California, Oregon, Idaho, and Washington. *Fisheries* 16:4-21.

² Williams, J. E.; Johnson, J.E.; Hendrickson, D. A., [and others]. 1989. Fishes of North America endangered, threatened, and of special concern. *Fisheries*. 14(6) 2-20.

the U.S. Fish and Wildlife Service, over 35 million people (age 16 or over) fished over 511 million days in 1991³.

Obviously, the human value underlying this potential loss of biological diversity is enormous. At the risk of sounding apocalyptic, let me say that it portends a wholesale and wholly negative change in our nation's aquatic and terrestrial ecosystems and the myriad human activities—commercial, recreational, and cultural—that depend on the integrity of those ecosystems.

This biological deficit is being fueled by aquatic habitat destruction that is not being controlled by the Clean Water Act. Some of the following facts illustrate this clearly:

- water quality standards are not being achieved in over one-third of our nation's waters, most of these failures are caused by nonpoint (polluted runoff source pollution)⁴;
- wetlands loss continues at an unacceptable rate, 290,000 acres per year according to the most recent, best estimate⁵;
- large, deep pools, critical to the health of Pacific salmonids, have decreased by 58% in the National Forests of the Pacific Northwest because of habitat loss from timber harvest and associated road construction; 80% loss has occurred on private lands of coastal Oregon⁶;
- fishing bans or advisories caused by the presence of contaminants in fish were in force in over 720 locations in the U.S. from 1990-1992;
- throughout the U.S., inadequate flows and ineffective fish passage caused by dams and other water diversions continue to destroy fish habitat and thwart fishery restoration efforts.

We can continue to finance our biological deficit much as we have our budget deficit, but for how long? This is a matter of disquieting uncertainty, especially in the biological context. In human terms, bankruptcy may be only temporary, but extinction is forever.

Comments on the Watershed Planning Provisions of S. 1114

Let me now turn to S. 1114 and begin by saying that, while it points in the right direction, it also contains serious flaws. The bill correctly points in the direction of watershed management and planning, but it fails to provide the direction necessary to restore and maintain the chemical, physical, and biological integrity of our watersheds.

Watershed planning *should* provide a better way for EPA and the state agencies to identify and address *all* sources of pollution and other forms of physical and biological impairment, such as instream flow problems. It should emphasize identification and protection of waters that meet water quality standards and remaining high quality waters for inclusion in antidegradation programs and prioritize reduction of pollution threats to these areas. It should identify and prioritize restoration projects for various waters, including wetlands and key riparian zones. It should not facilitate downgrading of stream uses, lowering of water quality standards, or grant extension of permits in the name of "flexibility" for local or regional areas.

Most importantly, it should be a comprehensive state-wide and nationwide approach to "water pollution prevention and control," the very essence of S. 1114. It should not be a rarely-used, completely voluntary, ineffective tool that sits idly in the federal/state water pollution control toolbox.

I am concerned that the watershed planning provisions of S. 1114 are not strong enough on the positive elements listed above, but do allow opportunities for too much slippage on existing water quality standards and designated uses.

Sections 301

Section 301 would replace existing Section 305(b), which currently requires water quality reporting every two years. Monitoring of waters, and associated 305(b) re-

ports, are critical to the achievement of CWA goals. Extending reporting requirements to five years will only serve to reduce pressure on states to improve their water quality control programs, and reduce the amount of information that citizen conservationists have available to use in their water quality advocacy efforts. TU opposes this change unless Section 301's monitoring and reporting provisions are strengthened, including the changes recommended below.

First, I suggest the goal of Section 301(b)(3) should be to develop monitoring requirements that fully assess the chemical, physical, and biological integrity of subject waters. This requires monitoring for all known or suspected pollutants in the water column, sediment, and biota. It also requires assessing the effects of instream flow modifications from hydropower projects and other diversions. I know that the Clean Water Act's overall jurisdiction here is limited, but no watershed planning or monitoring program is worth much if it does not address instream flows.

In addition, we have seen a troubling tendency on the part of states to classify waterbodies as "fully" in attainment despite clear evidence (fish and shellfish and bathing advisories and aquatic species loss) to the contrary. Section 301 thus should direct EPA to develop uniform standards to guide state attainment decisions.

Finally, in Section 301(b)(2)(A)(i), use of the term "balance" is insufficient. Even severely damaged habitat eventually recovers some biological balance. For restoration and maintenance purposes, however, the goal should be "balanced and diverse" populations of shellfish, fish, and wildlife.

Section 302

Section 302 provides the guts of the new watershed planning and management provisions of S. 1114. Again, while we support the concept and direction of Section 302, several problems are immediately apparent. First, Section 321(a)(1)(c)'s reference to "long-term social, economic, and natural resource objectives" is deeply troubling. This could be interpreted as somehow allowing states, in their management plans, to downgrade water quality standards and criteria without complying with existing Section 303's requirements and applicable regulations. Although economic, social, and natural resources objectives are clearly relevant considerations in defining water quality goals, the provisions of existing 303 and EPA regulations should control the process.

Second, Section 321(b)'s designation provisions harken back to the problems which have arisen with Section 208 under the 1972 Act and Section 319 under the 1987 Act. Allowing states to designate watershed management units on a voluntary basis ignores the simple rule that all land area is part of a watershed, and all parts form an integral whole. Making the program voluntary means that it is likely to fail. Allowing states to redraw watershed boundaries means that we will continue to see abuse and destruction of wetlands, floodplains, and perennial and ephemeral tributary streams. If there is any lesson in the Pacific Northwest salmon story it is that we cannot allow land disturbances to degrade instream and riparian areas.

To make Section 302(b) effective, you must make it mandatory. To make it scientifically sound, you must make it apply to the landscape in a manner that protects all wetlands, floodplains, and tributaries. In this regard, I commend to your attention to Appendix 5-K of the Forest Service's recent report (referenced above), which is the aquatic/fisheries basis for the Administration's recent Forest Plan for old growth/late successional forest ecosystems.

Third, in Section 321(b)(2), use of the terms "water and sediment quality" fails to address what we have witnessed over the past 20 years: attainment status for water quality standards with concomitant species depletion or extinction. If "biological integrity" has any meaning, it is not that species diversity remains relatively constant. In many cases, this will not even occur even if the habitat in question meets water and sediment standards. Therefore, we request that you include the words "or other impairment of the chemical, physical, and biological integrity" of subject waters in Section 321(b)(2). Further, I recommend that each designation under this provision should also identify opportunities for restoration of degraded physical and biological habitats, including wetlands, riparian areas, and instream habitats.

Fourth, opportunities for citizen conservationist participation, through public notice and comment, petitioning authority, and opportunity for judicial review, should be added to the watershed management provisions to be at least equivalent to other CWA programs. For example, in Section 302(b)(4), EPA approval of a watershed designation should require public notice and comment. Also, citizen conservationists should be given the opportunity to petition Governors to designate watershed management units. Further, in Section 302(g), approval of watershed plans is subject to public notice and comment, but unlike Section 303, it is not clear that EPA approval is subject to judicial review. Language should be added to this section

to clarify that EPA approval of a watershed plan is an action that does allow judicial review.

Fifth, protecting waters currently meeting water quality standards and remaining high quality waters should be a major point of emphasis of watershed plans. Unfortunately, lines 20-24 of section 321(g) refers to Tier I antidegradation only. Either here or elsewhere in the criteria for plan approval, there must be a requirement for development and implementation of a full antidegradation program for the watershed, with cross-reference to the new antidegradation section of the bill.

Sixth, EPA must maintain a strong role in development and oversight of watershed plans. Therefore, TU does not believe that it is appropriate for EPA to delegate to the state any aspect of watershed planning for which EPA currently has review, oversight, or approval responsibilities, such as water quality standards, wasteload allocations, and NPDES program elements, including Section 402(c) permit veto authority.

Finally, language in Section 321(g) Subsection 3 appears to substantially weaken existing point source requirements. This provision allows waivers or lengthy extensions from water quality-based requirements for point sources. This provision may wipe out the net gain in water quality improvement that is intended to be a product of watershed management TU opposes this provision and recommends that it be narrowed significantly or deleted.

I have addressed the basic problems we have uncovered with respect to Sections 301 and 302. I will conclude by noting that the Congress has a tremendous opportunity in Sections 301 and 302 to direct the course of much more than future watershed planning and management. Depending on how it frames Sections 301 and 302, Congress can truly determine the success of future watershed protection and restoration.

We at Trout Unlimited have some experience with watershed protection and restoration, a good example being our recent work on protecting and restoring author Norman McLean's beloved Big Blackfoot River in Montana. Success in these endeavors depends on having scientifically accurate information, protecting the remaining best habitat and water quality, and restoring key habitat in the watershed. Based on our experience, I believe that, although directionally correct, the watershed management and planning provisions of S. 1114 have serious flaws and, unless strengthened, will not yield effective watershed protection and restoration results.

Thank you for the opportunity to appear before the Subcommittee today.

TESTIMONY OF CURT SPALDING, EXECUTIVE DIRECTOR, SAVE THE BAY, PROVIDENCE, RHODE ISLAND

Save the Bay is Southern New England's largest non-profit environmental organization. We are dedicated to a clean and healthy Narragansett Bay that people enjoy. The Narragansett Bay Watershed extends far into Massachusetts and covers most of the State of Rhode Island. For twenty-three Save the Bay has aggressively advocated solutions to environmental problems throughout the Narragansett Bay Watershed. We appreciate the opportunity to forward our perspective on Watershed Planning and the Watershed Planning Provisions in S. 1114.

During Save the Bay's twenty-three year history, the organization has consistently promoted a strategic planning approach for the prevention and reduction of water pollution. Save the Bay has advocated this approach recognizing that improvements in the water and habitat quality will not easily be solved with any single action.

In this testimony I will summarize our experience with strategic environmental planning in the Narragansett Bay Watershed, present Save the Bays' view on how Watershed Planning can advance the protection and restoration of waterbodies, and comment on the Watershed Planning Provisions of S. 1114, to amend and reauthorize the Federal Water Pollution Control Act.

STRATEGIC ENVIRONMENTAL PLANNING IN THE NARRAGANSETT BAY WATERSHED

As point source discharges have been reduced, non-profit pollution sources have increased. More and more land is being converted to roads, highways, malls, subdivisions and industrial parks with little thought about their cumulative effect on water and habitat quality. In Narragansett Bay, we have seen considerable reconvert in upper bay water quality because of improvements in sewage treatment. At the same time Greenwich Bay, one of the largest and most productive shellfish areas in Narragansett Bay, has been closed to shellfishing due to polluted runoff.

Our organization has been involved with dozens of Watershed Management Planning efforts. These Watershed Planning efforts have varied exponentially in complexity, watershed size, and success. Several of these Watershed Planning efforts are highlighted below.

Upper Bay Watershed

- Before the Federal Water Pollution Control Act was enacted, planning efforts were well underway to solve gross pollution problems in upper Narragansett Bay. In response to these initial efforts, primary and then secondary treatment plants were built in the urban centers of Providence, East Providence and Pawtucket.

COASTAL WATERSHED MANAGEMENT

- Issues involving coastal access and land development became paramount in the early 1970s and a plan was developed to manage Rhode Island's coastal resources. The Coastal Resources Management Plan (CRMP) has been adopted and amended over the years to include "special area management" plans or sam plans. These plans were created to deal with sensitive coastal watersheds that needed site specific management. The Sam Plans have been adopted and revised over the past five to ten years.

SECTION 208: AREA WIDE WATER QUALITY PLAN

- Beginning in 1975, Rhode Island also attempted to develop a Comprehensive State Water Quality Management Plan. The plan took more than five years to develop and was known as the Section 208 Plan. It took its name from the section of the Clean Water Act that described the method and federal requirements of State water quality planning. The section 208 plan did identify the need for a significant improvement in the operation of the field's point sewage treatment plant in Providence which was implemented. However, dozens of other priority items were never accomplished.

SCITURATE RESERVOIR MANAGEMENT PLAN

- The State has recently (1990) completed a Comprehensive Watershed Plan for its largest public drinking water reservoir. Implementation of the is going forward and recommendations for state and local actions are being supported.

NARRAGANSETT BAY WATERSHED MANAGEMENT

- In 1985, Narragansett Bay was accepted into the National Estuary Program and the most recent Watershed Planning effort began in Rhode Island. This time the planning effort would cross State lines (60 percent of the Bay Watershed is in Massachusetts). The final Comprehensive Conservation and Management Plan was issued in late 1992. Since that time, implementation of the plan has been slow largely because the planning process failed to galvanize support for the plan's recommendations.

Distilling this experience, the most successful strategic Environmental Management plans in Rhode Island are characterized by successfully building support for a clear action agenda. The priorities and action items of these success stories are as dynamic as the systems they seek to restore and protect. Save the bay believes that unsuccessful or semi-successful Watershed Management Plan lacked one or more key elements. The key success element are:

- A governance/planning committee that truly represents all groups with political, regulatory or resource protection/use interest;
- A clear and open process that decides which resource protection issues are being adequately addressed and which are not;
- The endorsement and support of most regulatory/planning agencies required to implement strategies and work plans is secured;
- The plan is updated and reviewed periodically, preferably on a five year schedule; and
- Updates and reviews are based on continuous strategic water and habitat quality monitoring

UTILIZING STRATEGIC WATERSHED PLANNING

A Comprehensive Watershed Management approach is the best approach when the employment of established point source and non-point source programs prove to be inadequate to achieve water and habitat quality goals. An example best illustrates this point.

Dividing Warwick and Cranston is the Patuxent River. This River is severely degraded. To restore the Patuxent, save the bay supports a strategy that:

1. Controls point sources using wasteload allocation analysis.
2. Maximizes low technology management practices (i.e. cleaning storm drains, sweeping parking lots etc.) To reduce polluted runoff.
3. If after pursuing these strategies, it is unlikely that the water quality standards for the Patuxent cannot be achieved, a Comprehensive Watershed Management Plan should be developed and implemented focusing on more polluted runoff control, or other strategies, such as in-stream aeration and habitat restoration projects.

Polluted runoff is more diffuse, cumulative in effect, and is directly related to local, state and regional land use decisions. Regulating non-point sources of pollution cannot be done by writing a thousand permits. Controlling and mitigating non-point sources encompassing everything from educating individuals about consumer choices to restoring and protecting riparian wetlands. Watershed Management clearly is the appropriate tool for this job.

A good Watershed Management Plan not only contains the key elements listed above, it must also have the support of the stake-holders and sufficient funding to be implemented. This does not imply that a new bureaucracy needs to be created to implement and enforce a plan. If a plan is created by all interested parties (political and governmental players, public interest groups, resource protection advocates, and resource users), implementation can be carried out through coordinated but separate local, state and federal actions. Naturally, some portions of a good watershed plan will need the cooperative effort of one or more agencies.

This type of implementation and enforcement requires appropriate federal and state incentives and dis-incentives. Incentives should be similar to those found in section 6117(g) of the Coastal Zone Management Act and the Clean Air Act of 1990. For instance, section 106 funding, and most other federal assistance provided through the Clean Water Act, should be tied to successful Watershed Management Implementation. A very effective approach would be to withhold federal funding (under any program) from any responsible agency for nonperformance under the management plan.

Federal transportation funding to states should be linked to successful Watershed Management Plan implementation. The allocation of federal transportation money has a significant influence on local land use decisions which contribute to non-point source pollution in watersheds, not to mention the increase in runoff from the road construction itself.

As stated, Watershed Management Planning should be used to identify additional strategies to reduce non-point source pollution. The majority of non-point source pollution is caused by stormwater runoff, whether it runs off a interstate highway or a 300 acre cornfield. Not all stormwater discharges can be (or should be) regulated through the new stormwater discharge permit program.

Save the Bay believes Watershed Management Plans can build local consensus to allow more comprehensive actions to deal with stormwater runoff. Just as utility districts were established for sanitary sewerage service, so can they be established for stormwater runoff. Stormwater utility districts have been established in at least 50 major cities and counties in the United States. Small annual fees (typically 24 dollars per year per household) provide funding for water quality improvements, flood abatement projects, and infrastructure maintenance. New or increased stormwater discharges must be approved by the district. These stormwater programs have worked well in the areas where they have been implemented. Save the bay believes that stormwater utility districts must be an essential component of a watershed management plan.

In addition, Save the Bay believes that Watershed Management Plans should contain minimum land use standards and performance criteria. The guidance document issued for the coastal 6217(g) program—the blue book—would be acceptable as a minimum standard. Save the bay stresses that this guidance document should be used only as a *minimum*. Watersheds that already have water quality problems due to non-point source pollution should require stricter performance criteria such as mandatory minimum setbacks from wetlands, streams and rivers of at least 250 feet, regulatory street sweeping and catchbasin cleaning, wastewater management districts for unsewered areas, reduced pavement area and parking space requirements for new developments, and village or cluster zoning for residential areas. A Watershed Management Plan should also create state and local policies that encourage reinvestment in urban infrastructure rather than subsidizing suburban sprawl.

PROBLEMS WITH WATERSHED PLANNING AS PROPOSED IN S. 1114

Save the Bay is concerned about the proposed approach to Watershed Management Planning contained in S. 1114. Our concerns are:

1. Federal subsidies for doing Watershed Planning are too large. "Ownership" of a Watershed Management Plan is encourage by local investment in both time *and* dollars. Large amounts of federal funding should be reserved for plan implementation.
2. Watershed Management Plans are not mandatory for all waterways and waterbodies that are classified as "non-attainment" or "partial attainment" areas. Where the established strategy of point and non-point source control will not achieve water quality goals, Watershed Management Plans should be done. Other Watersheds should qualify for Management Planning efforts only after these priority Watershed Management Plans were approved.
3. There is no requirement to incorporate previous Watershed Management Planning efforts. As noted above, Rhode Island has produced many Watershed Management Plans for a variety of Watershed areas. The Narragansett Bay comprehensive conservation and Management Plan and the Scituate Reservoir Watershed Management Plan are two examples of valid Watershed Management Plans. These plans need to be implemented, not redone. Over the course of time they should be updated and revised, not relegated to the scrap heap and recreated with new federal funding.
4. The requirements for public participation are not well defined. Public participation should be defined beyond "maximum extent practicable". More language should be added defining public participation and establishing how issues are identified and priorities are set.
5. In some circumstances, Watershed Planning may lead to less aggressive point-source permit requirements. As mentioned earlier, we have an entire river watershed in serious nonattainment—the Patuxent River Watershed. The watershed hosts three sewage treatment plants and one major industrial polluter. The three sewage treatment plants are under a court ordered consent decree to improve their sewage treatment facilities to tertiary standards. It is clear to all Patuxent stakeholders that this action will not be enough to attain fishable/swimmable water quality standards. Save the Bay know that the non-point source pollution will have to be mitigated and prevented. Aware of this problem, congress included a 13 million dollar federal grant in the Intermodal Surface Transportation Efficiency Act (ISTEA) to remediate a large stormwater discharge from interstate 95.

If the Watershed Planning approach proposed in S. 1114 was in place five years ago, the three sewage treatment plants may not have been required to upgrade their facilities. Instead, there may have been a four year Watershed Planning process with a possible ten year implementation schedule. The process would have been heavily politicized because of the serious fiscal problems in the three cities.

The Watershed Planning provisions in s. 1114 may represent an almost irresistible temptation to local governments to delay upgrading sewage treatment plants. Aggressive requirements for nonpoint source pollution load reductions should not be used as an excuse not to reduce point source pollutant loading. Instead, Watershed Planning should encourage further innovations in point source treatment technology as well as work towards a better understanding of non-point source pollution control and mitigation. to do any less would be a betrayal of every citizen's right to clean water and a healthy environment.

July 26, 1993

**THE WESTERN GOVERNORS' ASSOCIATION TESTIMONY
ON
CLEAN WATER ACT AMENDMENTS
S-1114**

Before the Senate Environment and Public Works Clean Water, Fisheries,
and Wildlife Subcommittee

INTRODUCTION

Good afternoon. I am Lorna Stickel, Chair of the Oregon Water Resources Commission, and Chief Planner at the Portland Water Bureau. I am also a member of the Western States Water Council (WSWC). I have been asked to testify today on behalf of Governor Barbara Roberts, who is co-lead governor for water for the Western Governors' Association (WGA). The WGA and WSWC work together to provide strong leadership in developing regional solutions for water issues in the eighteen western states, and I have been involved in most of those activities. I am pleased to represent Oregon, the Western Governors' Association and the Western States Water Council in testifying on Title III of S-1114, WATERSHED PLANNING AND NONPOINT POLLUTION CONTROL.

Oregon has been on the forefront for testing watershed based natural resource management practices and watershed planning. We are proud of recent programs initiated to promote integrated watershed planning and watershed restoration. The program in Oregon is evolving rapidly, and passage of S-1114 could give the state an additional boost to make the program a success.

In a series of broadly representative workshops over the last three years, the Western Governors' Association and Western States Water Council have explored ways to improve western water management broadly. These workshops lead to a series of principles which endorse "bottom-up," broadly representative, flexible approaches to problem solving at the watershed or "problemshed" level. These "Park City Principles" are expressed in the attached WGA policy resolution (Resolution 92-007).

The Park City Principles strongly support the concept of comprehensive watershed management under the Clean Water Act. To provide greater definition to the concept, the WGA and WSWC have developed position papers regarding watershed management under the Clean Water Act which are enclosed. In particular they emphasize that water management is complex with many interests and values needing to be considered: water

quality, water quantity, habitat, wetlands, riparian areas, flood control, hydropower generation, and recreational, cultural, commercial, agricultural, industrial, and municipal uses. They view watershed management as an approach that offers great opportunities by allowing a focus on the most critical problems that affect a watershed. Further watershed management has the potential to foster cooperative problem solving to improve the environment in a cost-effective manner. It provides a means of developing an "ecosystem approach" relative to the protection of water quality and related values.

Although the Clean Water Act will focus on water quality issues, WGA's paper emphasizes that watershed management in states is not likely to be limited to discrete water quality issues, but instead may ultimately be used by the states to address the gamut of interconnected quality and quantity issues that arise from the use of this valuable resource. Therefore, the amendments to the Clean Water Act should allow the states to maintain flexibility to deal with all of the other interests and values, and should facilitate states' ability to address the issues holistically.

To encourage the benefits of a watershed approach under the Clean Water Act, the WSWC position paper states that the Clean Water Act should:

- (1) encourage, but not mandate, a watershed approach to water and natural resource management and protection;
- (2) allow flexibility to states and local entities to craft basin-specific goals and programs that are prioritized on the basis of risk to quality-of-life, human health, and ecological concerns;
- (3) emphasize performance, not planning;
- (4) not interfere with the rights of states to allocate water supplies;
- (5) allow states to use existing authorities and programs to establish watershed entities to meet their needs as they understand them;
- (6) require EPA to provide technical, financial, and research assistance; and
- (7) provide federal funding to support watershed management.

Title III as proposed addresses the principles listed very well. Therefore I am here to speak in support of the proposed amendment.

OVERVIEW OF TITLE III - SEC. 302 COMPREHENSIVE WATERSHED MANAGEMENT

In S-1114 Title III SEC. 302, the proposed new SEC. 321 sets out an excellent "Findings and Purpose" statement that stresses the need to integrate water quality with other natural resource management objectives. The bill establishes a framework that is very similar to one developed in Oregon last year. It establishes clear guidance and incentives, while remaining voluntary and flexible. It recognizes the importance of locally developed on-the-ground solutions. Programs need to set measurable short and long term targets.

implement both projects and actions and monitor results to show whether programs need to be adjusted.

The bill calls for a statewide watershed assessment. Independent of S 1114, Oregon is preparing to conduct a general statewide assessment of watershed health using a method prepared by EPA staff. We believe the assessment will help set priorities for state attention and funding allocations. Our work could probably serve as a prototype for other states.

The funding and incentives provided would be of real assistance to the states in carrying out watershed programs. However, in the long run, the restoration of watershed health is likely to require a far higher level financial commitment from all of those involved in the solutions than is provided in the long range funding level.

THE OREGON EXPERIENCE

Oregon has a long history of water quantity and quality planning on a basin and subbasin level. Most of those early plans are oriented to regulations rather than a broader range of actions. The state is implementing, as the result of a court decree, water quality oriented plans in 15 water quality limited watersheds. Oregon has taken the lead in developing a waste load allocation program in water quality limited watersheds. This watershed approach is an essential part of coming into compliance with water quality standards. Other watersheds in Oregon are the subject of planning largely because of endangered species listing or proposed listings. In these watersheds the whole watershed ecosystem is often of concern, including in many cases, water quality standard violations, inadequate streamflow, habitat loss and failure of altered watersheds to provide natural functions.

Watershed planning for water quality source control is the strategy followed in several other programs including, the Coquille Near Coastal Water Project, the Tillamook Rural Clean Water Program, the Columbia River Bi-state Study, the Willamette River Water Quality Study, and numerous Clean Lake projects. Many recent watershed programs emphasize partnerships and use demonstration projects, education, collaboration and cooperation to achieve results.

A reading of the Oregon documents will demonstrate to the committee that this state is well on the way to a voluntary program that matches very well the Title III proposal. Some of the key aspects to keep enthusiasm and support have been:

- That the program is locally based;
- Powers for implementation, however, are not transferred;

- The state already has a number of good regulations and programs to prevent additional problems for the environment;
- People are fearful of the potential economic and social impact of continuing to implement the Endangered Species Act, species by species;
- The program development is voluntary and flexible.

Key elements of a comprehensive watershed approach include:

- Involvement of all stakeholders;
- Attention to all watershed functions and conditions relating to its health;
- Adequate resources for planning and implementation;
- Clear goals and definite time frames to achieve them;
- Adequate support for research that shows the relationship between practices and problems/solutions;
- Incentives and sanctions.

Some of our experiences are briefly described here.

- The legislature established the Governor's Watershed Enhancement Board in 1987. The Board includes decision makers from 10 state and federal agencies. It provides grants for demonstration projects that enhance watersheds through non-structural means and grants for education projects that promote sound watershed management. Since then, nearly 2 million dollars have been awarded for 62 major projects and many more small grants. (Program status report enclosed).

- The Governor's Forest Planning Team, established in 1987 by executive order, has been reviewing National Forest and Bureau of Land Management plans since then. The state has sent a consistent message to the USFS and BLM planners of the need to assemble data and make decisions on a watershed basis rather than other administrative lines. For the most part all Forests and BLM districts revised at least the data and many decisions to reflect watershed conditions and impacts of proposed management activities on watershed health. The new Clinton Forest Plan strongly promotes the watershed approach.

- The Northwest Power Planning Council, during the eighties, set a goal of doubling fish runs in the Columbia basin, and as a result Bonneville Power Administration (BPA) funded stream enhancement projects through out the northwest. Projects were not developed on a watershed basis and as a result many failed to produce the expected results. As a next step the Power Council requested that Subbasin plans be prepared throughout the Columbia to target

high priority actions to enhance fisheries. However, BPA funding focused on instream projects, when many of the root causes of habitat problems are due to land management practices and impacts.

After the Snake River salmon species were listed under the Endangered Species Act, the Northwest Power Planning Council called for BPA to fund model watershed programs in each of the affected states. Oregon selected the Grande Ronde Basin. An active locally based program is now underway with full participation also by state and federal agencies. The Grande Ronde Model Watershed Program is identifying several early actions to begin the recovery.

- In 1990, following a legislative session that debated but did not resolve the issue of needing more locally based water resource planning, state agencies developed a pilot stream restoration program. The program was tested in a watershed of the John Day Basin. A stream restoration coordinator worked with a locally appointed basin council, state and federal agencies, tribes, landowners and interest groups to develop an action plan for the Middle Fork John Day Basin. Because of the many prior planning efforts in the basin, this program was assembled in only six months. It uses a watershed approach to stream restoration and has served as the basis for implementation since then, with several successes. Additional action plans are now being prepared in the basin with the help of Soil and Water Conservation Districts and the Bureau of Reclamation.

- In 1992 the state's Strategic Water Management Group (SWMG) chaired from the Governor's office and composed of agency directors of twelve resource agencies and the Oregon Executive Department, formally developed a new watershed management strategy. The strategy calls for a statewide assessment of watershed conditions, public values in each watershed, and likelihood of watershed program success. It promotes voluntary formation of watershed councils especially in high priority watersheds of the state. The councils would operate as local organizations, with partnership agreements with all participating government, tribal, and organizational interests. Organizational and procedural flexibility is written into the framework. The Councils will conduct more specific watershed assessments, develop management goals and an action plan that includes site-specific measures to protect and restore watershed health while, to the greatest degree, meeting economic, social and cultural objectives. SWMG would review and sign off on the action plans. The SWMG Watershed Management Strategy report is enclosed.

This process is being formally recognized by the Legislature in HB 2215 (enclosed) this session. It has passed both houses and has only to go through conference committee and the Governor to become law. The law does not

codify the process, but sets it up as a four year pilot program. The proposal gained wide support among interest groups, but in fairness there was also a high level of nervousness about whether this would create another layer of government and whether a voluntary program could achieve results. We are confident these concerns will be allayed as the program is implemented. Based on line item funding through EPA, one local council has already formed, the McKenzie River watershed. The Grande Ronde Model Watershed Board will also likely follow this process.

- In a major effort to manage resources holistically, nine state natural resource agencies teamed together to prepare a funding proposal to restore watershed health and sustainable production in two critical basins of the state. The proposal provides funds to support watershed councils, implementation, and state agency staff to participate in the program. State staff from six agencies would be housed together in the field, to help develop the database, watershed objectives, implementation options, project proposals, technical assistance and monitoring needed to accomplish the program. This proposal is likely to receive at least 7.5 million in funding for the coming biennium. (Description enclosed).

SUGGESTIONS TO IMPROVE THE BILL

The coordination of potential federal funding sources to implement water quality and watershed health restoration is critical. The proposed interagency committee to support comprehensive watershed management and planning is not given any specific charge. One key role could be to evaluate the adequacy of the combined federal funding sources to support and promote this voluntary program.

One area of concern is the use of the term "management entity" for both planning and implementation on page 85 and wording of the EPA approval criteria on page 90 lines 4 - 6. In the Oregon program, power is not transferred to a single entity. A watershed council coordinates planning and oversight of implementation, but the actual implementation will be carried out by the partners who retain legal authority and funding. Based on federal and typical state organizational structure, watershed planning will include multiple agencies. It is not realistic to require one entity to have full implementing responsibility. We would prefer wording such as "entity or entities" or insert the notion of an entity responsible for coordinating implementation and funding of the plan.

Another concern relates to the planning standards and time frames on watersheds when planning is prompted by ESA listings or other reasons. In these cases, water quality violations may or may not have the most urgent

need for attention. Current (new) wisdom is to build environmental improvements out from the remaining good quality "refuges" in a watershed rather than working on the worst problems first. If possible the law should recognize and endorse this strategy and perhaps in some instances allow different time frames for meeting standards in the "worst" areas provided that the refuge strategy is being implemented and a trend toward compliance is measured. The ten year time frame appears reasonable. We suggest that in SEC. 304. NONPOINT POLLUTION CONTROL, the implementation provision on page 104 should allow the three year time frame or the schedule as approved within a watershed plan developed under SEC. 321.

CONCLUSION

The proposed TITLE III - COMPREHENSIVE WATERSHED PROGRAM articulates an appropriate and constructive program and role for the EPA in the Clean Water Act. States and the federal agencies are all on a rapid learning curve for watershed management. In recognition of the fact that many entities are turning to watersheds because they make sense as a focus of management, WGA and the Western States Water Council are planning a meeting this fall of representatives of those entities to share their plans and to develop ways to coordinate. Representatives will be invited from EPA, the Soil Conservation Service, the Forest Service, the Bureau of Land Management, the Fish and Wildlife Service, the Bureau of Reclamation, the Corps of Engineers, the power marketing administrations, the Federal Energy Regulatory Commission, state agencies (water, wildlife, agriculture, and environment) local entities, and non-profits focused on resource management.

We haven't always done a good job in devising mechanisms which will accommodate such a diverse group of interests. This Act deserves credit for trying to do so. It is important to maintain the flexibility that will promote solutions tailored to varying state issues, management structures and laws. The answers lie within the specific targeted watersheds and developing them at the watershed level will provide the local buy-in that can achieve lasting results. Addressing environmental issues on a watershed basis holds great promise because it fosters the most efficient use of public resources and participants.

PROPOSED WATERSHED APPROACH TO THE CLEAN WATER ACT

Rationale

Effective water management is complex. There are many interests and values that need to be considered: water quantity, water quality, habitat, wetlands and riparian areas, flood control, hydropower generation, and recreational, cultural, commercial, agricultural, industrial and municipal uses. A watershed approach to water management involves integrating decision making processes and actions so that a more holistic view of the resource can be taken and so that individual actions are coordinated and work together. A watershed approach does not involve derogation of federal or state authority. However, it is grounded upon the idea of concrete local involvement. At its most basic, watershed management involves coordination between all levels of government, with the primary responsibility for crafting the details of a management scheme reserved to local actors, with substantive guidance and assistance from the state and federal levels.

The rationale for approaching water and related resource questions on a holistic watershed basis is the gains that can be made in terms of protecting and enhancing water quality and other social, economic and ecological values simultaneously.

This briefing paper will outline a potential scheme for incorporating watershed management authorities in the Clean Water Act. Although the paper will focus on water quality issues and the CWA, it is crucial to note that watershed management should not be limited to discrete water quality issues, but should ultimately be used by states to address the gamut of interconnected quality and quantity issues which arise from the use of this valuable resource. *Therefore, amendments should not obstruct the ability of states to deal with all of the other interests and values beyond water quality, and ideally should facilitate states' ability to deal holistically with them.*

Watershed Management under the Clean Water Act

The CWA already provides the statutory encouragement, as well as some incentives, for localities to undertake water quality-based watershed management activities. However, some changes to the CWA may be necessary. These include the development of inclusive processes which involve a broad range of players; greater coordination between federal statutes; greater statutory flexibility to allow the development of innovative, local management strategies; funding for watershed problem solving forums, planning activities and solutions; and greater emphasis on a geographic focus for resource management and problem solving. A "bottom-up" watershed approach provides forums to convene federal agencies, states, tribes, local governments and other stakeholders around a problem or set of problems. It also provides an incentive to citizens within the watershed to become involved in finding solutions and managing the resource.

The Structure

The proposed watershed approach would look like the following:

1. Using the current framework rather than a separate new program, authority should be provided to states under the CWA to undertake a holistic watershed approach to water quality control and to other watershed issues identified by states. Funding and technical assistance or incentives will be needed.

2. The governor of each state starts the process by conducting an assessment process which leads to the identification and prioritization of watersheds. The scale of the watersheds identified will vary depending upon the goals of the state. For example, the USGS delineates watersheds ranging from first order (a local watershed) to sixth order watersheds (major river drainages). Depending on the problem, the appropriate order watershed can be targeted, or watersheds can be aggregated to yield the appropriate scale. These can be reaggregated to address different problems.

Prioritization of watersheds would be based on *threats* from point and nonpoint source pollution problems, *opportunities* such as those to mitigate and/or restore wetlands and riparian areas, and *protection* of watersheds which are ecologically healthy.

3. States are then responsible for facilitating or enabling local problem solving. This bottom-up process must involve all key interests including agriculture, urban interests, industry, and environmentalists. Participation in watershed forums may vary depending upon the problem or goals being addressed.
4. After there is a firm commitment to a bottom-up system, it is critical that affected federal agencies work with state and local interests using a watershed focus. They may be asked to help with watershed plans, and should ultimately coordinate their activities around these local plans.
5. Federal money should be made available on a cost-share basis. Funding should be available to states, localities and motivated citizens within a watershed to begin addressing problems within a priority watershed. Federal incentives may be appropriate to engage all necessary parties, including other federal agencies. Federal technical assistance should also be available.

Federal Flexibility and State Responsibilities

Once states have identified and prioritized their watersheds and are committed to local problem solving processes, flexibility, with regard to meeting the goals of the CWA, should be provided to states. Flexibility is needed so that states can act in the face of uncertainty to protect their resources. A watershed approach can provide a framework for adaptive management so that states can readjust their efforts as they learn more about the resource and how it responds to past and present pollution control actions. Examples of areas in which states need greater flexibility include:

- encouragement and removal of constraints to bargaining and other creative solutions that can provide mechanisms for effective pollution control on a watershed basis. States may need extensive flexibility in designing cleanup and/or protection strategies. For example, this might include specific authority to allow point source dischargers to provide financial assistance to nonpoint source polluters to help reduce NPS loadings in exchange for offering relief from compliance deadlines in order to allow adequate time to demonstrate results. The purpose of this would be to produce more cost effective results watershed-wide. It may also involve some changes in permit conditions, or the creation of other incentives for polluters or other parties to participate or to fund efforts.
- removal of federal barriers to solutions. For example, there are liability obstacles to cleaning up abandoned mine drainage under Superfund.

- acceptance of abbreviated or less frequent reporting such as the total maximum daily load (TMDL) reviews and permitting reports. The rationale for this is that the current framework of reviews, reports, permit renewals are time consuming, resource intensive, and would be cumbersome and "out of sync" in the context of watershed programs because they run contrary to more comprehensive approaches. Allowing flexibility through abbreviated reports and extended deadlines would free up resources for watershed programs.

In exchange for the federal government removing barriers, providing greater flexibility, and providing funding and technical assistance, states will accept ecological restoration as a goal, adhere to watershed-specific timeframes for action, and become the accountable level of government. States will deal with TMDLs, develop monitoring programs, develop an integrated system for point and nonpoint source pollution control, and adopt EPA-approved basic criteria for watershed programs and evaluation of results. Broadly defined state standards should be the guide for assessing progress including performance measures or measurable standards related to the status of soils, water, and habitat.

Since each watershed solution may be unique, the development of contracts between states and the federal government may be an appropriate enabling tool for allowing individualized watershed approaches while ensuring accountability.

Principles

The federal government should:

- Work with the current institutional, management, technological and scientific framework.
- Encourage coordination and integration of existing programs at all levels of government.
- Work through states toward local solutions.
- Allow for any array of stakeholders to participate.
- Mandate goals, but allow states to develop the processes necessary to meet those goals.
- Facilitate targeting and priority setting through comparative risk assessment which includes not only health risks but ecological risks, and not only physical but social endpoints.
- Provide guidance to states to assist them with classifying their watersheds and determining overall goals.
- Work with states and localities to create watershed-relevant water quality standards.
- Insist upon compliance by all federal agencies with the CWA and the watershed plans developed under it.

The federal government should not:

- Mandate a new watershed approach or program.
- Hinder or inhibit current state-based initiatives and programs.

- Overemphasize planning at the expense of action and implementation.
- Unduly defer or delay improvements in water quality control of point sources.
- Violate the principle of state primacy over water resources. EPA should not be put in the business of allocating and reallocating water resources.
- Classify watersheds at the federal level.
- Develop a one-size-fits-all approach.

TESTIMONY OF MARLEN DOOLEY, ASSISTANT COMMISSIONER FOR ENFORCEMENT, NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION AND ENERGY

Good afternoon. My name is Marlen Dooley. I am Assistant Commissioner for Enforcement for the New Jersey Department of Environmental Protection and Energy (DEPE). I thank you for this opportunity to participate in this hearing and present a state's perspective on enforcement of the Clean Water Act.

In 1990, the New Jersey State Legislature unanimously approved and Governor Florio signed into law the New Jersey "Clean Hater Enforcement Act" (CWEA). The CWEA has strengthened enforcement of the State's water pollution control and prevention program by substantially amending the Water Pollution Control Act to require that permits be taken seriously and to ensure that enforcement actions are adequate to effectively deter potential violators.

The enactment of CWEA was prompted by a rising frustration within the Legislature over lagging progress in improving surface water quality throughout the State. Additionally, there was concern regarding the DFPE's response to the nature and extent of violations of New Jersey Pollutant Discharge Elimination System (NJPDDES) permits. In particular, the DEPE's practice of compromising the amount of penalty assessments was being questioned. Frequently, the department would assess penalties for the maximum amount allowed by law, and then significantly compromise or reduce the actual penalty in exchange for written, legally binding commitments by the permittee to bring the facility into compliance within a specific Period of time. These compromises, as they were intended, usually resulted in a substantial investment of capital by the permittee towards improvements in its treatment processes. The practice of significantly compromising penalty assessments, however, contributed to the perception that penalty assessments, like effluent limitations, were so flexible that the regulated community was not taking them seriously.

Moreover, in addition to the rising concern over non-compliance and inadequate enforcement, the enactment of the CWEA was prompted by a recognition that municipal wastewater treatment plants or publicly owned treatment works (POTWs) lacked the necessary tools to effectively implement and enforce industrial pretreatment programs and that a greater local role was necessary to appreciably improve water quality.

The CWEA was designed to enhance the department's enforcement scheme in a number of ways. The Act attempts to identify the most egregious violators by establishing two special classes of offenders: those responsible for serious violations and those committing a series of violations to be known as "significant noncompliers".

To ensure that appropriate enforcement action is taken for serious offenses, the Act requires the assessment of mandatory minimum penalties of \$1,000 for each serious violation. These penalties may not be waived or compromised. Permittees determined to be "significant noncompliers" are subject to minimum penalties in the amount of \$5,000. The Act also limits the department's discretion to compromise penalties beyond 50% of the assessed amount. In addition, the Act requires the imposition of minimum penalties of \$100 per day per pollutant for each item omitted on a Discharge Monitoring Report (DMR). Further, as a means of bolstering compliance monitoring, the Act requires that all major facilities be inspected by the department at least annually, including the sampling and analysis of each discharge.

The Act empowers POTWs with more extensive monitoring and enforcement tools. It also requires the POTWs to conduct annual on-site inspections and sampling for each major industrial discharger into its treatment works.

Based upon New Jersey's experience implementing the CWEA during the past two years, the Act appears to have helped achieve greater compliance. Inspections conducted in 1992 resulted in 505 facilities being rated as "unacceptable", reflecting a sharp decrease from 1991 in which 792 facilities were rated as "unacceptable."

These demonstrated improvements in compliance may be attributed to the implementation of a fair, but firm enforcement philosophy adopted by the department in response to the Act.

The main objective of the Clean Water Enforcement Act is to improve water quality through greater compliance. While the assessment of penalties is effective as a deterrent tool, it is only a means to achieve the goal of compliance. Accordingly, the DEPE measures success based not upon the amount of fines assessed, but upon the diligence of our efforts to achieve compliance.

In accordance with this philosophy, the department initiated an extensive outreach program with the regulated community in advance of the CWEA's implementation date urging that Steps be taken to ensure compliance. Rather than wait for

the deadline and begin penalizing would-be violators, the department worked with the regulated community to resolve actual and potential compliance problems. As a result of this outreach effort, the department executed 84 Administrative Compliance Orders (AGO's) with permittees during the six months prior to the CWEA's effective date. It should also be noted that, in anticipation of the implementation of the enhanced enforcement scheme, the regulated community in New Jersey made changes on its own initiative to better meet the CWEA's requirements.

Further, the department adopted a uniform penalty policy, in accordance with the Act, establishing the exclusive criteria applied to determine the amount of a civil administrative penalty assessment. The adoption of this policy ensures consistency in our penalty assessments among similar violations accompanied by similar circumstances.

The department also established internal protocols to ensure that the specific facts of each violation are individually examined to ensure the proper application of the penalty criteria. This intensive fact-specific review of each violation results in civil administrative penalty assessments that are fair and legally sustainable. As a result of this new enforcement approach, the amount of civil administrative penalty assessments has markedly decreased from \$56.9 million in 1990 to \$23.7 million in 1991 to \$17.5 million in 1992.

The corollary to this new enforcement approach is that the department no longer offers significant reductions of the assessed penalty count during settlement negotiations. This approach follows the proscription of the CWEA which prohibits the department from compromising or reducing a penalty by more than 50 percent of the assessed amount (except for POTWs). Consequently, the regulated community is on notice that the penalty assessments are fair and rational, and the department is prepared to vigorously litigate a penalty assessment.

This no-nonsense enforcement approach appears to have sent a clear message to the regulated community that penalty assessments are fair, not arbitrary, reflecting all relevant factual and legal considerations known to the department, and are therefore, litigation worthy. The greater certainty now associated with penalty assessments appears to have better facilitated settlement negotiations as well as successful litigation when penalties are contested. The department's collection of penalties increased from \$5.9 million in 1990 to \$10.8 million in 1992.

The department firmly believes that compliance is enhanced by establishing precisely defined requirements and clearly articulating the way in which compliance is measured by the department. Accordingly, throughout 1991 and 1992 the department continued its outreach to the regulated community by working with permittees to develop better guidance explaining the specific steps necessary to comply with the sampling and reporting requirements of the Act.

In conclusion, our enforcement philosophy is fair but firm with compliance as the primary goal. The DEPE strongly supports any federal actions to reauthorize the Clean Water Act that incorporates the same philosophy and goal into the Act.

I am available to discuss specifics of the state's experiences with CWEA and enforcement of the Clean water Act at the federal level. Thank you.

**TESTIMONY OF EDWARD LLOYD, GENERAL COUNSEL, NEW JERSEY
PUBLIC INTEREST RESEARCH GROUP**

I.) INTRODUCTION

My name is Edward Lloyd. I am General Counsel to the New Jersey Public Interest Research Group (NJPIRG) and Director of the Rutgers Environmental Law Clinic. I am testifying today on behalf of NJPIRG and the US. Public Interest Research Group. NJPIRG is the state's largest non-profit, non-partisan environmental and consumer research and advocacy organization with over 70,000 members. U.S.PIRG is the national lobbying office for state PIRGs in over 30 states with over 1 million members nationwide.

For over two decades, State PIRGs have fought to clean our waterways. PIRGs have played a key role in helping to pass pollution prevention and toxics use reduction laws in Massachusetts, New Jersey, Vermont and Oregon. NJPIRG has filed over 60 Clean Water citizen suits and helped to pass the country's strongest Clean Water enforcement law in New Jersey.

We urge Congress to bring some of these lessons learned at the state level up to the national level and incorporate them into the federal Clean Water Act. We support legislation introduced by Representative Frank Pallone, the Clean Water Enforcement and Compliance Improvements Act of 1993 (H.R.2727), and are working with Senator Frank Lautenberg to introduce similar legislation in the Senate.

II.) STRENGTHENING ENFORCEMENT OF THE CLEAN WATER ACT

A.) THE PROBLEM: CLEAN WATER ENFORCEMENT IS "WEAK AND SPORADIC"

Strong enforcement of the Clean Water Act is fundamental to the success of the program. Unfortunately, studies conducted by the General Accounting Office, the Inspector General's office, states and environmental groups demonstrate that discharge violations are routinely ignored even for serious and chronic violators. In addition, economic benefits are often not taken into consideration when penalties for violations are determined.

This lax enforcement of the Clean Water Act greatly reduces incentives to comply with the law. Richard Hembra, Director of Environmental Protection Issues at the U.S. General Accounting Office (GAO), testified before the House Subcommittee on Water Resources of the Public Works Committee during the 102nd Congress. In describing GAO's findings regarding enforcement of the Clean Water Act, Mr. Hembra said the following:

"Our work . . . clearly indicates that enforcement of our Nation's water quality laws continues to be weak and sporadic. Despite serious and longstanding violations, most enforcement actions are informal slaps on the wrist rather than formal actions, such as administrative fines and penalties. Further, even in the relatively few cases where penalties have been assessed, they are often significantly reduced or dropped without adequate documentation." (May 14, 1991)

Mr. Hembra concluded by stating:

"the ability of our Nation's environmental laws to protect health and the environment depends greatly on effective enforcement programs. Without enforcement, dischargers have little incentive to incur the cost of pollution control. At the same time industrial discharges that do abide by program requirements are unfairly placed at a competitive disadvantage with those who choose not to invest in pollution control equipment and practices."

John Martin, Inspector General (IG) of the U.S. Environmental Protection Agency testified before the Senate Environmental Protection Subcommittee of the Environment and Public Works Committee 102nd Congress (July 18, 1991) on enforcement under the Clean Water Act. The Inspector General's office conducted a series of audits to examine the effectiveness of the NPDES permit enforcement program and "concluded that enforcement actions taken by the EPA and the States were frequently ineffective in returning major municipal and industrial violators to compliance." Some of the examples of serious and chronic violators from the IG's audit are startling:

". . . a wood preserving operation in Virginia had a history of environmental problems that caused surface and groundwater contamination. Although five enforcement orders were issued for violations of its NPDES permits, not one penalty was assessed in 13 years of operation. Eventually, this facility was listed as a Superfund site, but it was not until two years later that its discharge permit was finally revoked."

". . . a municipality paid only \$7,800 for numerous NPDES permit violations over several years. This included \$3,200 for two instances in which more than 1600 fish are killed because of the violations. For exceeding a discharge limitation, this municipality was fined \$1,000; we estimated the penalty could have been \$390,000."

This is not to say that the maximum penalty is always in order, but that the penalty must reflect the severity of the violation and create an incentive to comply with the law. The IG's audits found that in 46 of the 69 NPDES cases evaluated, the penalty assessments were not sufficient to recover the economic benefit gained by noncompliance. The Inspector General concluded that "[w]hen penalties are reduced to below what it would cost to comply with the environmental laws, they encourage rather than deter noncompliance. Small fines and lengthy time limits to achieve compliance promote a pay-to-pollute mentality."

The Clean Water Act enforcement program should be strengthened to create greater incentives to comply with the law by setting mandatory minimum penalties for serious and chronic violators, prohibiting profits from polluting, strengthening the reporting and inspection requirements, and strengthening the citizen suit provisions in the law.

B.) TOUGHER ENFORCEMENT IS WORKING IN NEW JERSEY

In May 1990 Governor Jim Florio signed into law the New Jersey Clean Water Enforcement Act. We believe that this law provides a model for improved enforcement of the federal Clean Water Act and are working with Senator Frank Lautenberg and Representative Frank Pallone (both D-NJ) to introduce legislation modeled on the New Jersey law.

The New Jersey Clean Water Enforcement Act requires—

- The New Jersey Department of Environmental Protection and Energy (NJDEPE) to increase inspections at permitted facilities and assess mandatory minimum penalties for certain violations; and
- Permittees to submit monthly discharge monitoring reports.

Just last month, the NJDEPE released their "Second Annual Report of the Clean Water Enforcement Act." The Executive Summary of this report is attached at Appendix I of this testimony. The NJDEPE report found the following:

Inspections of facilities show that more facilities are attaining compliance. The number of facilities which inspections found "unacceptable" decreased from 792 in 1991 to 505 in 1992.

The average penalty assessed in each formal enforcement action has decreased. Because the Act requires the NJDEPE to conduct more frequent inspections of facilities operated by "significant noncompliers," the agency finds violations more quickly and takes timely action. This results in reduced average penalties. Compliance with the self-reporting requirements is improving. The number of violations for failure to submit discharge monitoring reports (DMR) decreased from 59 in the last six months of 1991 to 38 for all of 1992.

C.) THE SOLUTIONS

Enforcement of the Clean Water Act should be strengthened to improve government accountability and remove current obstacles to citizen suits.

- 1.) IMPROVE GOVERNMENT ACCOUNTABILITY
 - a) SET MANDATORY MINIMUM PENALTIES

Noncompliance must be addressed quickly rather than waiting for patterns of chronic violation to develop. Uniform minimum responses to violations by regulators will decrease average penalties assessed and bring violators into compliance more rapidly. Uniform minimum penalties which do not favor some discharge methods over others also reduces incentives to shift discharges from surface or ground water or sewage treatment facilities, for example.

To address the issue of chronic significant violations of the Clean Water Act we recommend that state programs be required to establish mandatory minimum penalties for "serious violations" of and for "significant noncompliance" with the Act based on the current U.S. EPA definition.

Congress should amend the Clean Water Act to require that a mandatory minimum penalty of \$1,000 per violation be assessed for "serious violations" which includes—

- (1) discharge violations of a hazardous substance that is 20% or more over the permitted limit or
- (2) discharge violations of a pollutant (other than a hazardous substance) that is at least 40% over the permitted limit.

In addition, the Clean Water Act should be amended to require that any facility determined to be in "significant noncompliance" be assessed a mandatory minimum penalty of \$5,000 per day per violation. We recommend that the definition of "significant noncompliance" be based on EPA's current criteria¹ and would apply if any of the following occur:

- 1) Two serious violations of any pollutant during any 6-month period;
- 2) Four exceedances of a monthly average limit for any pollutant, by any amount, in any 6-month period; or
- 3) Two instances of failure to submit Discharge Monitoring Reporting within any 6-month period.

¹ The criteria used by EPA to define "significant noncompliance" are: 1) two exceedances of a monthly average limit in any 6-month period that meet the following criteria: 40% over limit for conventional pollutants and nontoxic metals, 20% over limit for toxic pollutants; or 2) four exceedances of a monthly average limit in any amount in any 6-month period.

b.) PROHIBIT PROFITS FROM POLLUTING

The existing Clean Water Act allows "economic benefits" to be taken into consideration in assessing penalties. Unfortunately, this authority is greatly underutilized. In June 1991, the GAO released findings from their review of the use of economic benefits in penalty assessments which found that "in nearly two out of three penalty cases concluded in fiscal year 1990 in EPAs air, water, hazardous waste, and toxic substances programs, there was no evidence that economic benefits had been calculated or assessed."²

To recoup economic benefits and create disincentives to violate the law, we recommend that the Clean Water Act be amended as follows:

- i) Amend section 309 by adding the following at the end the section:

"(h) GENERAL RULE.—Notwithstanding any other provision of this section, any civil penalty assessed and collected under this section must be in an amount which is not less than the amount of the economic benefit (if any) resulting from the violation for which the penalty is assessed"

- ii) Amend section 309 to require the Administrator to issue regulations establishing a methodology for calculating the economic benefits or savings resulting from violations of the Act. Pending issuance of these regulations, economic benefits shall be calculated on a case-by-case basis.

- iii) Amend section 309 as follows to limit compromises of civil penalties:

"Notwithstanding any other provision of this section, the amount of a civil penalty assessed under this section may not be compromised below the amount determined by adding the minimum amount required for recovery of economic benefit under subsection (h), to 50 percent of the difference between the amount of the civil penalty assessed and such minimum amount."

c.) IMPROVE DISCHARGE REPORTING AND INSPECTIONS

Access to accurate and consistent reporting is fundamental to the success of the Clean Water Act's permitting and enforcement programs. Without accurate monitoring and reporting of discharges, protection of waterways is impossible.

Currently, there are great discrepancies between the National Pollutant Discharge Elimination System (NPDES) for direct dischargers to surface waters and the National Pretreatment Program requirements for industrial users of publicly owned sewage treatment plants (POTWs). Monitoring and reporting requirements are often less stringent for indirect discharges to POTWs. This creates incentives to discharge to POTWs to avoid reporting and monitoring. In addition, public access to both types of reporting is poor.

NPDES permit holders file their monitoring reports with the states. Filing of these reports occurs months after they are submitted, and are filed in district offices rather than in one central location. Indirect dischargers to POTWs generally file monitoring reports with the relevant municipality, and the data is not compiled in a national computerized database.

The lack of adequate information on discharges remains a problem for regulators and citizens. All dischargers to surface waters, ground waters, and publicly owned treatment works should be required to increase frequency of data reporting. This would serve to increase timeliness of the data and prevent violators from masking the severity of their violations through averaging of data points over long periods of time.

To improve access to discharge reporting, Congress should amend the Clean Water Act to require—

- (1) all "major" facilities discharging to ground waters, surface waters or treatment works facilities to submit discharge monitoring reports (DMRs) on a monthly basis; Any other permit holder, should submit DMRs on at least a quarterly basis;
- (2) DMRs be signed by the highest ranking official at the plant with day to day operational responsibilities;
- (3) all Significant Industrial Users (SIUs) of POTWs should be required to file DMRs monthly with the treatment works, states and with EPA regional offices. In addition, states should be required to input this data into the EPA Permit Compliance System; and

² Environmental Enforcement: Penalties May Not Recover Economic Benefits Gained by Violators, GAO/RCED-91-166, June 1991.

(4) EPA to make compliance data on EPA's computerized Permit Compliance System available to the public by computer telecommunication, similar to the existing citizen access to Toxics Release Inventory data under the Emergency Planning and Community Right to Know Act.

Inspections of permitted facilities tend to be superficial "walk throughs" that do not require independent sampling to verify the accuracy of discharge data submitted by the permittee. In some instances, facilities receiving permits for the first time are not even inspected before the permit becomes effective. The reliance of the Clean Water Act on self-reported information makes verification and important component of successful implementation.

Congress should amend the Clean Water Act to require that—

(1) Major industrial or municipal facilities be inspected once a year and that the inspection should, at a minimum, include a review of housekeeping measures, sampling techniques, maintenance records and independent sampling of the permittee's effluent;

(2) If a facility is in "significant noncompliance" with the Act or is renewing a permit, an inspection should be conducted within 6 months of the facility becoming in significant noncompliance with the Act or renewing a permit; and

(3) If a facility is being permitted for the first time, an inspection should be conducted prior to the effective date of the permit.

New Jersey has implemented an improved inspection program and has credited it with helping to bring compliance up and average penalties down because the most serious violations are caught earlier.

d.) LIMIT ISSUANCE OF PERMITS TO "BAD ACTORS"

"Significant noncompliers," as defined in the discussion on mandatory minimum penalties, should be considered "bad actors" under the Clean Water Act and as such, Congress should prohibit issuance of new permits to any person who has been identified as a "significant noncomplier" until the Administrator or the States in which the violations occur determine that the conditions giving rise to such violations have been corrected.

2.) REMOVE CURRENT OBSTACLES TO CITIZEN SUITS

Citizen suits are a tried and true method of bringing polluters into compliance with the Clean Water Act. The 1972 Clean Water Act included authority for citizens to sue polluters, thereby, recognizing that the U.S. EPA and states might be unable or unwilling to aggressively pursue all violators.

In 1985, Congress again recognized the importance of citizen suits.

"Citizen suits are a proven enforcement tool. They operate as Congress intended to both spur and supplement to government enforcement actions. They have deterred violators and achieved significant compliance gains." [Senate Report No. 50, 99th Cong., 1st Sess. 28 (1985)]

The U.S. Department of Justice's Statistical Report for Fiscal Year 1992 acknowledges the "dedication, hard work and effort put forth by the private citizen groups and others who sue non-government polluters for violating the nation's environmental laws." The report goes on to say—

These groups perform a valuable public service by joining the Federal Government in seeking compliance with a host of environmental statutes particularly the Clean water Act. Over the past 4 fiscal years, they have collectively recovered for the United States Treasury over \$9 million in penalties and interest.

Over 60 percent of the penalties were recovered from NJPIRG initiated suits. The penalties recovered are listed Table I.

While the existing citizen suit provisions have allowed significant enforcement activity, they contain a number of obstacles to citizen enforcement that should be removed.

a.) CITIZENS SHOULD BE ABLE TO SUE FOR PAST VIOLATIONS

A 1987 Supreme Court case, *Chesapeake Bay Foundation v. Gwaltney of Smithfield, Ltd.*, 484 U.S. 49 (1987), seriously weakened the deterrent effect of civil actions.

Section 505(a)(1) of the Clean Water Act provides that any citizen may commence a civil action against any person "alleged to be in violation of the Act. The Supreme Court, in *Gwaltney*, interpreted those words to mean that citizens cannot sue for "wholly past" violations, i.e., a case in which all violations occur before the com-

plaint is filed and citizens can not allege in good faith that violations may be continuing.

The result of *Gwaltney* is that companies have an incentive to delay compliance until citizens notify them of intent to sue. The company then has 60 days to get itself into compliance and avoid all penalties and keep any economic benefit from the violation. This greatly undermines the deterrent effect of citizen suits.

The Congress amended the Clean Air Act in 1990 to allow citizens to commence action against any person "who is alleged to have violated (if there is evidence that the alleged violation has been repeated) or to be in violation" of the Act.³

Members of the Senate and Environment and Public Works Committee strongly supported this amendment to the Clean Air Act as the following comments demonstrate:

"The outcome [in *Gwaltney*] is inappropriate because it provides no penalty to sources that have violated the act in the past." [Senate Majority Leader Mitchell, 136 Cong. Rec. S3239]

"There is no justification for allowing polluters to enjoy the unjust enrichment gained by failing to comply in the past even if they comply in the present." [Senator Baucus, *id.* at S3237]

"Citizens should have authority to sue for wholly past violations." [Senator Lieberman, *id.* at S3174]

Under *Gwaltney*, "[t]here is no penalty for being caught . . . The *Gwaltney* problem can be fixed. It is not a defect in every environmental statute." (Senator Durenberger, *id.* at S3183)

We urge Congress to make similar amendments to the Clean Water Act. The Clean Water Enforcement Act would amend the Clean Water Act to allow citizens to sue for past violations and remedy the effects of *Gwaltney*. [See section III below for comments on the *Gwaltney* fix contained in S. 1114]

b.) DEFINITION OF CITIZEN STANDING SHOULD BE CLARIFIED

The definition of "citizen standing" determines who has the authority to sue violators. Congress intended to confer to citizens standing to the limits of the Constitution. Section 505(g) of the Clean Water Act provides that the "term 'citizen' means a person or persons having an interest which is or may be adversely affected."

The court in *PIRG v. Powell Duffryn Terminals* [913 F.2d 64 (3rd Cir. 1990), Cert. denied, 111S.Ct 1018(1991)] held that plaintiffs must show that defendants discharged a pollutant which "causes or contributes to the kinds of injuries alleged by the plaintiffs." [931 F.2d at 72-73] This standard not only places an improper burden on plaintiffs to demonstrate harm to water quality but is also contrary to both congressional intent and Supreme Court decisions.

The Congress decided in 1972 that government regulators "need not search for a precise link between pollution and water quality." [S.Rep.No. 414, 92nd Cong., 1st Sess. 7 (1971)] Congress determined that all pollution is harmful, no one has a right to pollute and pollution is temporarily permissible only because of technological limitations. Citizens should not have to meet a test for standing that is more stringent than the test for holding polluters liable for permit violations.

The Supreme Court held in *Valley Forge Christian College v. Americans United for Separation of Church and State* [454 U.S.464, 472(1982)] that, under Article III of the Constitution, a plaintiff must show (1) injury in fact (2) which is fairly traceable to defendant's illegal conduct and (3) which is likely to be redressed by a favorable decision. Courts have found that the "injury in fact" requirement has been met by evidence that persons use the water downstream from the defendant's discharge, or would use the water if it were not polluted. In addition, courts have held that the "fairly traceable" requirement does not mean that plaintiffs must show to a scientific certainty that defendant's pollution caused plaintiff's injuries.

To clarify Congressional intent, Congress should add the following "finding" to the statute:

Congress finds that a discharge which results in a violation of this Act or a regulation, standard, limitation, requirement, or order issued pursuant to this Act interferes with the restoration and maintenance of the chemical, physical, and biological integrity of the water system into which the discharge flows (either directly or through a publicly owned treatment works), including any waters into which the receiving waters flow, and, therefore, harms those who use or enjoy such waters and those who use or enjoy nearby lands or aquatic resources associated with those waters.

³ 1990 Clean Air Act Amendments, section 304(a).

In addition, Congress should amend the definition of "citizen" in Section 505(g) of the Clean Water Act by adding the following language:

a person or persons having an interest (including a recreational, aesthetic, environmental, health, or economic interest) which is or may be adversely affected and includes a person who uses or enjoys the waters into which the discharge flows (either directly or through a publicly owned treatment works), who uses or enjoys aquatic resources or nearby lands associated with the waters, or who would use or enjoy the waters, aquatic resources, or nearby lands if they were less polluted."

c. COURTS SHOULD HAVE GREATER FLEXIBILITY IN DETERMINING THE DISPOSITION OF PENALTIES AND SETTLEMENT FUNDS

The Department of Justice has objected to numerous settlements on the ground that payments have been made to environmental projects rather than the U.S. Treasury. Congress intended there to be greater flexibility in determining the disposition of penalties and settlement funds. The conference report on the 1987 amendments to the Act states that these mitigation projects "preserve the punitive nature of enforcement actions while putting the funds collected to use on behalf of environmental protection." [H. Rep. No. 1004, 99th Cong., 2nd Sess. 139 (1986)]

The Clean Water Act should be amended to clarify the intent of Congress. The following language should be added to Section 309(d) and 505(a): "The court may, in the court's discretion, order that a civil penalty be used for carrying out mitigation projects which are consistent with this Act and which enhance the public health or the environment."

3.) INCREASE CITIZEN'S RIGHT-TO-KNOW THROUGH WATER POSTINGS

Citizens have a right to know when significant threats to their health or environment are present in their communities. The public should have access to information regarding the discharge of toxins and other pollutants into the waterways in which they swim and fish. One-third of the nation's remaining productive shellfish waters are closed on any given day because of pollution.⁴ In addition, in 1991, U.S. ocean and bay beaches were closed or advisories issued against swimming on more than 2,000 occasions in the coastal states that monitor beach water quality. High levels of bacteria—primarily from raw human sewage—are responsible for the overwhelming majority of these closures and advisories.⁵

Despite these facts, there are no federal requirements that the public be notified when water quality standards are violated. Nor are there uniform requirements for determining the nature and extent of fish and shellfish bans, advisories and consumption restrictions. Congress should amend the Clean Water Act to—

- (1) Require public postings at waterways that do not meet applicable water quality standards or are subject to a fishing or shellfish ban, advisory or consumption restriction;
- (2) Require NDPEs permit holders to maintain clearly visible signs indicating that the facility discharges into waterways and other information helpful for gaining greater information regarding those discharges, including the permit number and location of the permit;
- (3) Require POTWs to include, in customers' quarterly bills, information regarding their permit including a list of their violations over the preceding 12-month period; and
- (4) Require the EPA to develop uniform standards for posting bodies of water and requirements for determining fishing and shellfish advisories.

III.) COMMENTS ON ENFORCEMENT RELATED SECTIONS OF THE WATER POLLUTION PREVENTION AND CONTROL ACT OF 1993 (S. 1114)

This testimony comments on provisions contained in S. 1114 related to enforcement, including provisions contained in Title V (Permit Program and Enforcement), section 2 (Findings and Purpose), and Sections 201, 204 and 503 (provisions related to pretreatment).

⁴ *Stemming the Tide: Conservation of Coastal Fish Habitat in the United States*, summary of a National Symposium on Coastal Fish Habitat Conservation, Baltimore Maryland (March 7-9, 1991).

⁵ *Testing the Waters: A National Perspective on Beach Closings*, NRDC, Kailen Mooney and Ashley McLain, July 1992.

It also addresses a number of issues that we believe are critical to improving enforcement under the Clean Water Act but that are missing from S. 1114. These issues are discussed in detail above.

A.) TITLE V of S. 1114—ENFORCEMENT

1. PAST VIOLATIONS—We support a modified version of section 503(a) of S. 1114.

Section 503(a) would effectively overrule *Gwaltney of Smithfield Ltd. v. Chesapeake Bay Foundation*, 484 U.S. 49 (1987), by allowing citizens to sue for wholly past violations “if there is evidence that the alleged violation has been repeated.” the bill correctly recognizes that the *Gwaltney* decision is bad enforcement policy because it allows polluters to escape accountability for their actions and undermines the deterrent effect of civil penalties. The requirement for repeated violations contained in S. 1114 parallels the change in the 1990 Clean Air Act amendments.

The requirement that violations be repeated correctly recognizes that a single, isolated, past violation is not likely to warrant enforcement action. However, such suits will rarely, if ever be brought. When isolated violations are involved, the permittee may invoke EPAs “upset” defense as a defense to liability. 40 CFR 122.41(n). Even if liability is established, the courts are not likely to impose significant penalties since, under section 309(d) of the Act, they must consider the history and seriousness of the violations in setting a penalty.

On the other hand, the “repeated violations” requirement contained in S. 1114 is likely to be raised as a defense by defendants in many cases with multiple violations simply because it blurs the bright line of liability and provides an opportunity for delaying tactics. For example, defendants are likely to argue that repeated violations must be established on a pollutant by pollutant basis and that a violation is only enforceable when no corrective action is taken to prevent the specific cause of that particular violation. It would therefore increase the cost and complexity of citizen enforcement in the same way that the *Gwaltney* decision has led to costly and complex litigation over whether violations are continuing. For these reasons, we recommend that the requirement that the violations be repeated be deleted from S. 1114, as in section 10(a) of the Pallone “Clean Water Enforcement Act” (H.R. 2727).

2. USE OF PENALTIES FOR BENEFICIAL PROJECTS—We support section 503(b)(1) of S. 1114.

Section 503(b)(1) of S. 1114 would clarify existing law by specifically authorizing courts to order that civil penalties be used for beneficial projects that enhance public health or the environment. This change reaffirms the statement in the conference report on the 1987 amendments to the Act that such projects “preserve the punitive nature of enforcement actions while putting the funds collected to use on behalf of environmental protection.” H. Rep. No. 1004, 99th Cong., 2d Sess, 139 (1986).

3. RESTORATION OF DAMAGED NATURAL RESOURCES—We support section 503(b)(2) of S. 1114.

Section 503(b)(3) properly expands the scope of injunctive relief in government and citizen suits to permit courts to order polluters to restore natural resources damaged as a result of their violations of the Act.

4. OFFSETTING PENALTIES—We support a modified version of section 503(b)(5) of S. 1114.

Section 503(b)(5) of S. 1114 properly amends Section 309(d) of the Act to provide that the court may offset penalties imposed in prior government actions involving the same violation. This change is necessary to allow citizen suits to proceed when EPA or states do not act within the 60-day notice period and file their suit after citizens do but settle their suit first. Two circuit courts have held that, in these circumstances, citizens cannot continue their action for the same violation even though they sued first. *Work v. Tyson Foods, Inc.*, 921F.2d 1394, 1404 (8th Cir. 1990), cert denied, 112 S.Ct. 414 (1991); *ASLF v. Eastman Kodak Co.*, 933 F.2d 124,127 (2d Cir. 1991). *Contra NRDC v. Loeuengart & Co., Inc.* 776 F. Supp. 996,1000 (M.D. Pa. 1991); *PIRG v. Elf Atochem North America, Inc.*, 817 F.Supp. 1164, 1171-1172 (D.NJ. 1993).

Section 503(b)(5) of S. 1114 appears to be intended to clarify that citizens are not precluded from seeking additional, nonduplicative relief in their action after a later-filed government action is concluded. However, to make this principle effective, it should be stated not only in the penalty provision (Section 309(d) of the existing Act) but also in the jurisdictional section (Section 505(b) of the existing Act). S. 1114

should therefore be amended to add the language in Section 10 of the Pallone "Clean Water Enforcement Act" (H.R. 2727).

5. FEDERAL FACILITIES ENFORCEMENT—We strongly support Section 503(c) of S. 1114.

This section of S. 1114 grants the EPA, States and citizens the authority to sue federal facilities to enforce the Clean Water Act. Congress made a similar amendment to the Resource Conservation and Recovery Act during the 102nd Congress. Similar legislation has been introduced in the House of Representatives by Reps. Peter DeFazio and Dan Schaefer. One significant difference, is that the House bill considers radionuclides pollutants that would be regulated. We urge the Senate to include similar language.

6. STATE ADMINISTRATIVE ENFORCEMENT—We support Section 503(e)(2) of S. 1114.

Section 503(e)(2) of S. 1114 would delete the existing subparagraphs of section 309(g)(6) of the current Act under which certain state administrative penalty actions can preclude EPA and citizen enforcement. This is an important and needed change. As EPA has explained in its workgroup report under section 314(b) of the 1987 amendments to the Act, courts in recent years have construed the preclusion provisions so broadly that almost any state administrative action, no matter how inadequate, has preclusive effect. As a result, Section 309(g)(6) and the Gwaltney decision have become the two most troublesome obstacles to citizen enforcement. This change conforms to that proposed in section 5(g) of the Pallone "Clean Water Enforcement Act" (H.R. 2727).

By making this change, it is unnecessary to make the technical amendment set forth in section 503(b)(5)(B) of S. 1114. This technical amendment assumes that state administrative penalty actions will continue to have preclusive effect, and would merely ensure that state actions have no greater preclusive effect than EPA administrative penalty actions.

7. RECOVERY OF ECONOMIC BENEFIT—We support a significantly modified version of Section 503(b)(6) of S. 1114.

Section 503(b)(6) of S. 1114 would authorize EPA to sue violators which have paid state penalties that do not recover the violators' economic benefit. Section 503(b)(7) of S. 1114 would authorize EPA to withhold funds to states which do not have adequate authority to impose administrative civil penalties against violators. While these provisions improve existing law, they do not go far enough.

First, section 503(b)(6) should authorize citizens, as well as EPA, to sue when state penalties do not recover economic benefits. Second, section 503(b)(7) assumes that the problem with state administrative enforcement is lack of authority, while GAO and EPA IG reports show that the real problem is lack of will to enforce the Act effectively. To address the latter problem, S. 1114 should be amended to contain the language in section 5 (h) and (i) of the Pallone "Clean Water Enforcement Act" (H.R. 2727), which require states to assess and collect penalties which, at a minimum, recover economic benefit. In addition, those bills require EPA to issue regulations which establish a uniform methodology for calculating economic benefits.

8. SINGLE OPERATIONAL UPSET DEFENSE—We support Section 503(e)(3) of S.1114.

Section 503(e)(3) properly deletes the single operational upset defense. This defense was added in 1987 because Congress apparently wanted to limit penalties when there are multiple simultaneous violations from a single "upset" event. However, the single operational upset provision contained in S. 1114 is ambiguous and difficult to apply. The court is already required to consider the seriousness of the violations in assessing penalties [33 U.S.C. 1319(d)]. S. 1114 therefore properly repeals the single operational upset provisions in Section 309(c)(5), (d) and (g) of the existing law. This conforms with section 5(b) of the Pallone "Clean Water Enforcement Act" (H.R. 2727).

9. JUDICIAL REVIEW OF STATE-ISSUED PERMITS

Section 501(d) correctly provides that states must provide an opportunity for citizens to obtain judicial review of state-issued permits. This amendment is necessary to counteract a decision by the Virginia courts that only the permittee has standing to seek judicial review of its permit. This change corresponds to that in section 6(b) of the Pallone "Clean Water Enforcement Act" (H.R. 2727).

B. SECTION 2 OF S. 1114—FINDINGS

Paragraphs (a)(2) and (a)(9) of this section contain several findings that discharges of pollutants are harming human health and the environment and that the authority of the government and citizens to enforce the Act need to be strengthened. These findings are helpful and appropriate.

However, the connection between the existence of environmental harm and the right of citizens to bring enforcement actions should be stated more clearly. Courts have suggested that citizens must show that illegal discharges cause measurable harm to downstream waters. *NRDC v. Watkins*, 954 F.2d974, 980-981 (4th Cir. 1992). However, Congress decided in 1972 that, in setting effluent limits, EPA "need not search for a precise link between pollution and water quality." Senate Report No. 414, 92d Cong., 1st Sess. 8 (1971). Citizens should not have to meet a standard of harm for standing which is more stringent than that for liability.

Congress has the power to define what type of harm confers standing to sue. As Justice Kennedy stated in *Lujan v. Defenders of Wildlife*, 112 S. Ct. 2130, 2146-2147 (1992), "Congress has the power to define injuries and articulate chains of causation that will give rise to a case or controversy where none existed before, and I do not read the Court's opinion to suggest a contrary view."

Congress should make a finding that any pollution which is discharged in violation of the Act harms users of the waters related to that violation. This will reduce the potential for protracted disputes over the standing of citizens to hold polluters liable for their violations. S. 1114 should be amended to add the findings in Section 2(b) and the definition of citizen standing in section 10(g) in the Pallone "Clean Water Enforcement Act" (H.R. 2727).

C. PRETREATMENT provisions in S. 1114.

S. 1114 takes a number of positive steps forward in the area of enforcement of pretreatment programs. However, these improvements alone do not go far enough in correcting deficiencies in current pretreatment programs.

First, they do not require EPA and States to issue permits for all significant industrial users (SIUs). Second, they do not require indirect dischargers to monitor and report their discharges more frequently to determine whether they are in compliance. Without these changes, it will be difficult for citizens and WPA to monitor and enforce compliance with pretreatment programs. We recommend that S. 1114 be amended to add language from sections 6 (d) and (e) of the Pallone "Clean water Enforcement Act" (H.R. 2727).

Third, S. 1114 section 503(b)(3)(A) does not authorize citizens to enforce local limits established by POTWs. The addition of the words "pretreatment requirement" alone could be read to exclude local limits, because section 503(b)(3) contains an expansion of EPA and State authority which distinguishes between requirements of pretreatment programs and local limits. To address this problem, section 503(b)(3)(A) should be changed to either (1) define pretreatment requirement to include local limit or (2) add the words "local limit" after "pretreatment requirement." Section 3 and 10 of the Pallone "Clean Water Enforcement Act" (H.R. 2727) offer a similar method for fixing this problem.

Fourth, S. 1114 does not take the additional necessary step of declaring that a violation of a pretreatment requirement, including local limits and monitoring and reporting requirements, is a violation of federal law. Section 3 of the Pallone "Clean Water Enforcement Act" (H.R. 2727) would correct this problem by revising section 307(d) of the existing law to make it unlawful to violate pretreatment standards, requirements, and local limits.

On the positive side, section 201(c) of S. 1114 strengthens pretreatment programs by requiring pretreatment standards for indirect dischargers be no less stringent than the effluent standards for direct dischargers. This will discourage the current practice where direct dischargers faced with enforcement actions have tied in to POTWs to obtain less stringent control requirements. We support this provision.

Section 204(a) of S. 1114 authorizes EPA and the States to issue permits to indirect dischargers which are not subject to a pretreatment program. It will thereby increase the universe of dischargers subject to regulatory control and enforcement, and we support this provision.

Section 503(b)(3) of S. 1114 authorizes citizens to enforce "pretreatment requirements" as well as pretreatment standards. This will allow citizens to enforce monitoring and reporting requirements against indirect as well as (under current law) direct dischargers. We support this provision.

D. PROVISIONS MISSING FROM S. 1114

1. MANDATORY MINIMUM PENALTIES

As discussed above, we believe that mandatory minimum penalties for "serious violations" and for "significant noncompliance" will bring the most serious violators into compliance more quickly, strengthen the deterrent effect of the law, and ensure that states that take tough action against violators of the Act are not penalized by creating a more level "playing field."

These provisions are contained in the Pallone "Clean Water Enforcement Act" (H.R. 2727) and language from these bills should be added to S. 1114.

2. RIGHT TO KNOW ABOUT TOXICS IN WATERWAYS

As discussed above, we urge the Senate to include provisions in their Clean Water Act amendments which will inform the public about toxics and other hazardous materials in waterways and establish a national program for testing and posting waterways.

We urge the Subcommittee to adopt the language contained in the Pallone Clean Water Enforcement Act.

3. IMPROVED DISCHARGE REPORTING AND INSPECTIONS

As noted above, access to accurate and consistent reporting is fundamental to the success of the Clean Water Act's permitting and enforcement programs. Both the Pallone and Lautenberg bills contain expanded reporting and inspection programs. However, the Pallone bill provides greater direction to the EPA on how often the inspections must occur and what must be included in the inspections. We urge the Subcommittee to adopt the Pallone version of this provision.

4. PUBLIC ACCESS TO COMPLIANCE DATA

We support language contained in S. 1081 introduced by Senators Baucus and Chafee during the 102d Congress.

The Baucus-Chafee bill introduced in the last session of Congress (section 13(g) of 1081, 102d Cong., 2d Sess.) provided that compliance data on EPA's computerized Permit Compliance System would be made available to the public by computer telecommunication, similar to the existing citizen access to the Toxics Release Inventory data under the Emergency Planning and Community Right to Know Act. It would have also required EPA Regional Offices to publish lists of significant violators in local newspapers on a quarterly basis. As Senator Chafee noted in his comments on that bill, "this provision is based on the idea that citizens have a right to know when significant threats to their health or environment are present in their communities."

These provisions would significantly improve existing law concerning public access to compliance information. However, they are absent from S. 1114. They should be restored, as in the form set forth in section 4(b) of the Pallone "Clean water Enforcement Act" (H.R. 2727).

CITIZEN ENFORCEMENT SUITS

The Division gratefully acknowledges the dedication, hard work and effort put forth by the private citizen groups and others who sue non-government polluters for violating the nation's environmental laws. These groups perform a valuable public service by joining the Federal Government in seeking compliance with a host of environmental statutes, particularly the Clean Water Act. Over the past 4 fiscal years, they have collectively recovered for the United States Treasury over \$9 million in penalties and interest. These groups are recognized below with our thanks and appreciation.

Table I—from the U.S. Department of Justice Statistical Report FY 1992.

Public Interest Research Group of New Jersey	\$5,915,161.97
Sierra Club Legal Defense Fund	1,184,214.00
Atlantic States Legal Foundation	1,039,133.25
Natural Resources Defense Council (NRDC)	645,500.00
Chesapeake Bay Foundation	299,822.00
Public Interest Research Group of Massachusetts	122,650.00
Public Interest Research Group of Ohio	100,000.00
State of Missouri	100,000.00
Westchester Fish, Game & Wildlife Association	60,000.00
Friends of the Earth	27,013.70
Hudson River Fishermen's Association	25,000.00
Public Interest Research Group of Illinois State	25,000.00
Save the Bay (Rhode Island)	22,450.00
Pennsylvania Environmental Defense Foundation	20,000.00
Ohio Environmental Council	15,000.00
Connecticut Fund for the Environment	10,000.00
Village of Kildeer	10,000.00
Braxton Citizens for a Better Environment	8,000.00
Arkansas Wildlife Federation	5,000.00
State Line Fishing & Hunting Club	5,000.00
Tennessee Environmental Council	5,000.00
National Environmental Foundation	2,000.00
American Littoral Society	1,000.00
City of New York	1,000.00
State of Rhode Island	1,000.00
TOTAL:	\$9,648,944.92

APPENDIX I

SECOND ANNUAL REPORT OF THE CLEAN WATER ENFORCEMENT ACT

PURSUANT TO NJSA 58:10A-14.1

EXECUTIVE SUMMARY

New Jersey's Water Pollution Control Act ("WPCA") is intended to restore, enhance and maintain the integrity of New Jersey's waters. Under the WPCA, the Department of Environmental Protection and Energy ("DEPE" or "the department") administers the New Jersey Pollutant Discharge Elimination System ("NJPDES") to regulate discharges of pollutants to these waters. The United States Environmental Protection Agency ("EPA") has approved the NJPDES program and thereby delegated to New Jersey the authority to implement the water pollution permit system required under the Federal Clean Water Act.

In 1990, Governor Florio signed substantial amendments to the WPCA, known as the Clean Water Enforcement Act ("CWEA"). The CWEA strengthened enforcement of New Jersey's water pollution control and prevention program by requiring the department to assess mandatory minimum penalties for certain violations, increasing the accountability of NJPDES permit holders and operators of publicly-owned treatment works, and providing for greater citizen participation in water pollution prevention and enforcement activities. The requirements of the CWEA which are relevant to this report became operative on July 1, 1991.

This executive summary presents the highlights of the Department's implementation of the WPCA in 1992 and the plans for further improvements in 1993 and beyond.

Enforcement

The department seeks to improve New Jersey's water quality by encouraging increased compliance with the water pollution control laws. The department's enforcement efforts have several facets designed to serve that goal, such as inspecting and monitoring dischargers; working with dischargers to identify and resolve potential and actual compliance problems; taking enforcement action when those efforts reveal violations of the law; and frequently negotiating resolutions of enforcement actions so that the permittees agree to upgrade their treatment works and processes to prevent future violations. The following findings show that these efforts are bearing fruit in the form of greater compliance.

Inspections of facilities show that more facilities are attaining compliance

The 1992 data concerning inspections show a trend toward compliance by more facilities. The department performed 2,919 inspections of facilities in 1992, compared with 1,406 in the last six months of 1991 (as noted above, the CWEA did not become operative until July 1, 1991). Following an inspection, a facility receives an "acceptable" or "conditionally acceptable" rating if it has valid permits for all of the discharges which require permits; it performs the monitoring required under the permits; it submits completed discharge monitoring reports ("DMRs"); no serious violations have occurred; it is not considered a "significant noncomplier" as a result of its record of recent violations; and a licensed operator operates the facility's treatment works. The number of facilities which the inspections found "unacceptable" decreased significantly in 1992. In 1991, 792 facilities earned "unacceptable" ratings, compared with 505 facilities in 1992.

Compliance with the self-reporting requirements which are the heart of the NJPDES permit system is improving.

The NJPDES permit system is based upon each permittee's own timely and accurate reporting of compliance with permits through the submission of discharge monitoring reports ("DMRs"). Compliance with DMR requirements is therefore central to compliance with the WPCA.

In 1992, permittees moved toward more substantial compliance with the DMR requirements. The number of violations for failure to submit DMRs decreased from 59 in the last six months of 1991 to 38 for all of 1992. The bulk of the DMR violations in 1992 consisted of omissions in otherwise complete DMRs, rather than failures to submit DMRs at all.

In addition, during 1992 a trend toward better compliance with all aspects of the DMR requirements began to develop. The number of DMR-related violations dropped from 301 in the first half of 1991 to 107 in the second half of the year.

The average penalty assessed in each formal enforcement action has decreased.

The department undertook 339 penalty assessment actions in calendar year 1992, compared with 233 in calendar year 1991. At the same time that the department increased the number of penalty assessments; the total dollar amount of the penalty assessments decreased from \$23.7 million in 1991 to \$17 million in 1992. Accordingly, the average penalty assessed in each formal enforcement action decreased. The decrease continues a trend reported in the 1991 CWEA Annual Report.

The continuing decrease in penalty assessments reflects the department's application of the statutory criteria established in the detailed in revised penalty regulations. The revised penalty regulations promulgated in August 1991 establish the uniform penalty policy required under the CWEA. In implementing that uniform penalty policy, the department employs penalty assessment procedures which require fact-specific determinations of penalty amounts. Through these measures, the department works to assess penalties which are rational, tailored to the facts of particular violations, and legally sustainable.

The department expects the application of this approach to penalty assessments to affect penalty collections in two ways. The decrease in penalty assessments tends to decrease total penalty collections. At the same time, however, the percentage of penalty assessments which the department actually collects should increase; as penalty assessments are viewed as more legally sustainable, the incentive to contest the assessment decreases, and a larger percentage of those penalties which are contested will be upheld on appeal. The net effect of these two influences in 1992 was to decrease penalty collections to \$10.8 million, compared with \$13.1 million in 1991.

The efforts of the Attorney General and the County Prosecutors continued to contribute to effective enforcement.

The Attorney General and the County Prosecutors are responsible for criminal enforcement of the WPCA 1992 saw the resolution of several criminal actions filed under the WPCA Most prominent, Ciba-Geigy Corporation and two of its officials entered into a plea agreement under which the company agreed to pay \$3.5 million in fines and the officials were each fined \$25,000.

Permits

In addition to an effective enforcement policy an efficient and thorough permit process is also essential to achieving the WPCA goal of improved water quality. The following findings describe improvements in the NJPDES permit process that serve this goal.

The department increased its total number of permit actions by nearly 140% over 1991.

In 1992 the department substantially increased the pace of its actions on NJPDES permits. The total number of permit actions (issuing new permits; renewing, modifying or terminating existing permits; and issuing discharge allocation certificates for new discharges or major expansions of municipal facilities) increased by nearly 140% over 1991, from 265 in 1991 to 630 in 1992. This increase included more than twice as many new permits (162 in 1992 compared with 73 in 1991) and more than four times as many permit modifications (317 in 1992 compared with 75 in 1991).

The department expects environmental benefits to result from the substantial increase in the number of new, modified and renewed permits issued. When action on a permit is completed, the permittee becomes subject to the most current standards available. Incorporating the most current standards into the permit generally results in the permit becoming more protective of water quality. In contrast, when a permit renewal or modification is delayed, the permittee may be operating in accordance with less stringent standards adopted several years earlier.

The department expects the increase in permit actions to bring economic benefits as well. Using more permits provides the permittees with greater certainty concerning regulatory requirements, and enables them to anticipate expenditures that they will need to undertake to improve water quality.

The department is developing an extensive restructuring of the NJPDES permit system.

The current NJPDES permit regulations have remained largely unchanged since they became effective in 1981. The regulations have not kept pace with developments in the Federal and State statutes, rules, policies and procedures affecting the issuance of permits. To address this problem, the department made substantial progress during 1992 in readying a substantial overhaul of the regulations governing the NJPDES permitting system.

The primary goal of the restructuring is to enable the department to address water quality issues comprehensively, with particular concentration upon issues which affect water quality over an entire watershed or basin. The primary means to this end is a watershed approach to permitting (rather than the existing site-specific approach) which will enable the department to focus attention upon specific pollutants in each water body and better evaluate the impact of control measures. On February 1, 1993, the department requested public comments regarding the policies, technical issues and administrative reforms that this restructuring entails.

Another goal of the restructuring of the NJPDES rules is to improve the efficiency of the permit application and permit issuance procedures. Some of the changes upon which the department has requested public comment include the following:

1. Allowing permit applicants to submit their applications in the form of draft permits to be reviewed and revised by the department. This change eliminates one step from the permit process in which the department prepares a draft permit based upon a traditional permit application;
2. Expanding the scope of changes to existing permits which can be accomplished through minor modifications;
3. Providing for automatic permit renewal when a new permit review would provide no environmental benefit;
4. Allowing concurrent review and processing of water quality management plan amendments and NJPDES permit applications; and
5. Increasing the use of general permits and permits by rule, instead of individual permits for each applicant.

The department eliminated duplicative NJPDES permits for 87 permittees.

Twenty-three delegated local agencies in New Jersey operate municipal treatment works under pretreatment programs approved by the department. Under these pretreatment programs, the delegated local agencies regulate discharges to their treatment works.

In December 1992 the department adopted amendments to the NJPDES rules to comply with the mandates of CWEA and the Federal pretreatment regulations. One important goal of those amendments was to eliminate the duplication of permitting and enforcement efforts between the department and the delegated local agencies. The CWEA granted the delegated local agencies enforcement powers equivalent to those of the department; the department therefore determined that it was unnecessary to require industries with permits issued by delegated local agencies to obtain permits from the department as well.

As a result of this rule change, 87 permittees had their NJPDES permits terminated and no longer pay fees to the department for those permits. In addition, eliminating the duplicative permits enabled the department to concentrate its permitting and enforcement efforts more efficiently and more effectively in those areas in which there was no duplication of effort.

Delegated Local Agencies

A significantly smaller proportion of the violations reported by delegated local agencies were serious violations.

The delegated local agencies have reported information showing that they are continuing to perform compliance monitoring and inspections of their permittees actively and in a highly visible manner. The delegated local agencies reported a total number of violations in 1992 which was proportional to the number of violations they reported in the last six months of 1991. However, a significantly smaller proportion of the 1992 effluent violations qualified as "serious violations." The percentage of effluent violations which were serious violations decreased from 50.5% in 1991 to 41.4% in 1992.

Water Quality Assessment

The department will analyze the effects of permitted discharges upon water quality.

In its first eighteen months implementing the department focused upon the permitting, enforcement, criminal and fiscal aspects of the law. To evaluate how those efforts have affected water quality, in 1993 the department is commencing a study of water quality both upstream and downstream of selected discharge sites. The study will enable the department to evaluate the effect of those selected discharges upon water quality. The study will encompass both surface waters and ground waters. The results of the study will assist the department in gauging the effectiveness of its entire NJPDES program and in planning future initiatives.

Use of Penalty Revenues

The funding of the NJPDES permit program has been the subject of ongoing discussion and debate. In July 1992, DEPE Commissioner Weiner convened a task force to evaluate the system under which NJPDES fees are assessed, with a view toward making that system more fair and rational. Former Senator Laurence Weiss chairs the task force, which includes representatives of the Chemical Industry Council, the Association of Environmental Authorities, local governments and other interested parties. The department will continue to engage in dialogues with Senator Weiss and others in an effort to keep improving the NJPDES program.

CWEA penalty revenues contributed substantially toward the cost of the NJPDES program.

The NJPDES program is funded primarily from fees paid by permittees. However, the provides for penalty revenues to be used exclusively for enforcement and implementation of the WPCA, except when otherwise specifically provided by law. Penalty revenues applied to enforce and implement the WPCA reduce the amount which must be raised through fees, dollar for dollar. The result is a reduction in the portion of the Program costs funded by those permittees who comply with the law, and a shift of a substantial portion of the cost to permittees who do not attain compliance.

As a result of the application of penalty revenues, there will be no increase in the portion of NJPDES permit program costs funded with fees in the year ending June

30, 1993. For the majority of NJPDES permittees, 1993 fees have been reduced, with the average reduction amounting to five percent.

As noted above, the department expects penalty revenues to continue decreasing as compliance with the WPCA increases. For this reason the department cautions against relying upon penalty collections to continue providing this level of funding toward the permit program over the long term.

The report which follows this Executive Summary presents detailed information under the following subject headings: Enforcement, Permitting, Delegated Local Agencies, Criminal Actions, Fiscal, and Water Quality Assessment. The report also includes an Introduction which outlines the relevant requirements of the WPCA and the CWEA.

TESTIMONY OF STEVEN A. HERMAN, ASSISTANT ADMINISTRATOR FOR ENFORCEMENT, ENVIRONMENTAL PROTECTION AGENCY,

Good afternoon, Mr. Chairman and Members of the Subcommittee. I am Steven A. Herman, Assistant Administrator for Enforcement of the Environmental Protection Agency (EPA). I appreciate the opportunity to testify before you today on Clean Water Act (CWA) reauthorization. Although the Act is one of our oldest environmental statutes, it is presently facing new challenges as we gain further knowledge of the disparate sources of water pollution in this country. We believe that the complexity of the water pollution problems requires a sophisticated and ever-vigilant water enforcement program, both to ensure the continuation of environmental gains already achieved and to ensure that the goals embraced by the Congress in this reauthorization translate into further gains during the years ahead.

My testimony today is limited to the enforcement provisions of the Act, both as to how the existing provisions have worked and what new water enforcement amendments would help us make further environmental gains. I will quickly review the enforcement authorities that are now available to us under the CWA, as well as the water programs that these authorities enforce. I will then look at what has been achieved in water enforcement, and outline our future water enforcement objectives. Finally, I will suggest some changes to the Act which would help us achieve those objectives. I am pleased to note that some of the enforcement changes that we support are already included in S. 1114.

CLEAN WATER ACT PROGRAMS AND ENFORCEMENT AUTHORITIES

The CWA establishes several distinct programs, the requirements of which are enforceable: (1) the National Pollutant Discharge Elimination System (NPDES) program, for controlling the discharge of pollutants from point Sources (defined as a "discernable, confined and discrete conveyance" such as a pipe or a ditch); (2) the Industrial Pretreatment Program, for controlling industrial discharges to publicly owned (sewage) treatment works (POTWs); (3) the § 404 program, for controlling the discharge of dredge and fill materials to wetlands and other waters of the United States; and (4) the Oil Pollution Act, § 311 of the CWA, for controlling and responding to spills of oil and hazardous substances.

None of these programs is enforced by EPA alone. In each case Congress has provided that EPA enforce in partnership with the States, or with local municipalities, and in some instances with another Federal agency. Citizens have also been provided enforcement authority for most instances in which EPA could enforce.

National Pollutant Discharge Elimination System

Pursuant to § 301 of the CWA, it is unlawful for any person to discharge any pollutant from a point source into the waters of the United States except in compliance with various enumerated sections of the CWA. To comply with the Act, one must obtain an NPDES permit authorizing and regulating the discharge of pollutants. The NPDES permit, issued either by EPA or by a State under a program approved by EPA, establishes permissible levels of pollutants that may be discharged. The permits also establish monitoring, testing, and reporting requirements.

EPA and approved States have issued approximately 64,000 NPDES permits controlling point source discharges of pollutants. Of these, approximately 7,100 permits are issued to "major" dischargers, either large industries or municipal operators of larger POTW. EPA also has a general NPDES permitting program applicable to specific programs, e.g. stormwater and feedlots.

Industrial Pretreatment Program

The NPDES permitting program, described above, applies only to facilities that discharge directly into surface waters, e.g. lakes, rivers, wetlands, or oceans. Facilities that discharge into a sewerage system that leads to a POTW, rather than directly into a surface water, are regulated under the CWA Industrial pretreatment program. This program requires that controls be placed on the discharge of pollutants to POTWs as necessary: (1) to prevent pollutants from interfering with the functioning of the POTW; (2) to prevent those pollutants from causing the POTW to violate its NPDES permit; and (3) to assure compliance with the POTW's sludge use or disposal practices.

Generally, municipalities that operate POTWs with a daily flow of more than 5 million gallons are required to operate an industrial pretreatment program. This program is incorporated into the municipality's NPDES permit and is enforceable under the CWA The Industrial pretreatment program at smaller POTWs is generally implemented either by the EPA or by an approved State. To implement the program, significant industrial users must be issued permits or orders regulating their discharges. These permits or orders, similar to NPDES permits, set out limitations on pollutants and other requirements which must be met in order to comply with the CWA.

Wetlands

Section 404 of the Act establishes the primary Federal regulatory program protecting wetlands. Pursuant to this section and §301 of the Act, discharges of dredged or fill material into wetlands and other waters of the United States are illegal, unless permitted or exempted from regulation. This section is jointly implemented by EPA and the Army Corps of Engineers. The Corps has issued general permits for categories of activities having only minimal environmental impacts as well as activities in certain categories of waters, such as small, isolated wetlands. Other regulated discharges to waters of the United States must, be authorized pursuant to an individual § 404 permit. Activities in waters that are typically regulated under § 404 include fills to create residential, commercial and industrial development sites, infrastructure development, water resource projects, and conversion of wetlands to uplands for farming and forestry. Like the NPDES permitting program, States may be approved to operate the § 404 permitting program.

Oil Pollution Act

Section 311 of the CWA, as amended by the Oil Pollution Act of 1990 (OPA), prohibits discharges of harmful quantities of oil and hazardous substances into waters of the United States. This provision differs from the permitting programs under the Act described above in that it is intended to deal with spill situations, where the discharges could not be anticipated in advance. This provision therefore contains measures intended to prevent spills from occurring, and to cope with spills once they have occurred. Preventative measures include the requirement that immediate notification be provided to the government upon discovering that a spill has occurred, and a requirement that owners and operators of non-transportation facilities handling oil prepare and comply with a spill prevention, control, and counter-measure (SPCC) plan. In addition, § 311, as amended by the OPA, now requires certain facilities and vessels to prepare and submit to the government response plans for cleaning up oil and hazardous substance spills. Finally, section 311 establishes a five year felony penalty for failure to report a spill of a hazardous substance or oil.

In the context of clean-up, § 311 makes owners and operators of vessels or facilities from which oil or a hazardous substance is discharged liable to the United States for costs incurred in the removal of the spill (subject to certain defenses). Costs can include expenses incurred by the United States in assessing damage to, as well as restoring and replacing, natural resources harmed by the spill.

EPA and the Coast Guard jointly administer the spill penalty and response programs under § 311. Although States do not administer the program, § 311 does not preempt any State or municipality from imposing additional requirements or liability related to spills.

Clean Water Act Enforcement Authorities

Congress has provided EPA with several enforcement mechanisms for responding to violations of the requirements of the Act. These authorities fall into four general categories: administrative enforcement, civil judicial enforcement, criminal enforcement, and Federal facilities enforcement.

Administrative Enforcement

Administrative Compliance Orders

Section 309(a) authorizes the Administrator to issue, upon finding that a person is in violation of the Act or a permit under the Act, an order requiring compliance with the Act. These orders are not subject to review in an administrative hearing or court except upon enforcement of the order by the Agency. Compliance orders are the Agency's first level of formal enforcement.

Administrative Penalty Orders

In 1987, when last reauthorizing the CWA, Congress added a new § 309(g), authorizing the Agency to impose penalties in administrative actions for violations of the Act. These actions can be brought for essentially the same set of violations for which civil judicial actions could be brought, but at a much reduced cost in terms of Agency resources. However, unlike the civil judicial authority, administrative penalties are not authorized for violations of an administrative compliance order.

Two classes of administrative penalties are established under § 309(g). Class I penalty actions, subject to, an expedited hearing process, are limited to \$10,000 "per violation", and a total penalty of no more than \$25,000. Class II administrative penalty actions, subject to more elaborate Administrative Procedures Act (APA) hearing procedures, are limited to \$10,000 "for each day during which the violation continues" and a maximum penalty amount of \$125,000.

Section 311 Administrative Orders

Under § 311 of the CWA, as amended by the OPA, Congress has established an administrative penalty scheme similar to that under § 309(g) of the CWA. The Coast Guard or EPA may assess a Class I administrative penalty of \$10,000 per day of violation, up to a maximum of \$25,000, or a Class II administrative penalty of \$10,000 per day of violation, up to a maximum penalty of \$125,000.

Civil Judicial Enforcement

Pursuant to section 309 of the Act, the Administrator is authorized to commence an action in Federal district court to seek to enjoin a violator of the CWA to comply with the Act and to obtain penalties. EPA may commence a civil action against any person who is regulated under the water pollution prevention programs of the CWA described above. Violators are subject to civil penalties of up to \$25,000 per day for each violation. Courts are required to consider specific factors in determining an appropriate penalty amount, including, among others, the seriousness of the violations and any economic benefit that accrued to the violator as a result of the violations.

Section 311 Civil Judicial Enforcement

Section 311 of the CWA establishes a separate civil judicial penalty authority applicable to spills of oil and hazardous substances. Any person who is the owner, operator or person in charge of any vessel or facility from which oil or hazardous substances are spilled is subject to civil penalties of up to \$25,000 per day of violation or \$1000 per barrel of oil or unit of reportable quantity of hazardous substance spilled. If the spill was the result of "gross negligence" the minimum penalty is set at \$100,000 and the maximum at \$3000 per barrel of oil or unit of reportable quantity of hazardous substance spilled.

Section 311 Removal and Cost Recovery Authority

While § 311 does not provide the court with authority to order injunctive relief, any person, including the owner or operator of a vessel or facility, can be subject to equitable relief in the event of an imminent and substantial threat from an actual or threatened discharge. Any person who fails to properly carry out removal of a discharge under an order is subject to a fine of \$25,000 per day of violation or an amount up to three (3) times the costs incurred by the Oil Spill Liability Trust Fund.

Criminal Enforcement

In its present form, the CWA provides for both misdemeanor and felony violations. Negligent criminal violations of the Act are misdemeanors, subject to fines of up to \$25,000 per day of violation and jail for up to 1 year. These sanctions are essentially doubled for second offenders. Knowing violations of the Act are felonies, subject to fines of up to \$50,000 per day of violation and jail for up to 3 years for a first offense, again essentially doubled for second offenders. The Act also provides, in recognition of the importance of the self-reporting and monitoring scheme of the

Act, that knowing false statements are punishable as felonies, subject to jail sentences of up to two (2) years. Finally, the CWA provides that a person who knowingly violates provisions of the Act and also knowingly places another person in imminent danger of death or serious bodily injury may, upon conviction, be punished by a fine of up to \$250,000 and fifteen (15) years in jail.

Since 1972 the CWA has also included a provision which prohibits the Federal government from contracting with any person who is convicted of a criminal violation under the Act. This requirement that mandatory financial consequences flow from the fact of criminal convictions has proven to be a very effective adjunct to the criminal enforcement of violations of the Act.

Federal Facilities Enforcement

Compliance at Federal facilities is monitored by EPA primarily through facility inspections and the analysis of self-monitoring reports which are required to be submitted by certain CWA permittees. Upon the discovery of a violation at a Federal facility, EPA may initiate an enforcement action pursuant to the CWA administrative compliance order authority and Executive Order 12088. Typically, the facility is notified in writing of the violation and given an opportunity to respond to the notice within a specified period of time. EPA and the Federal agency then negotiate a "Federal Facility Compliance Agreement" or an "Administrative Order on consent" regarding compliance matters at the violating facility. These agreements/orders may be enforced in Federal district court under the citizen suit provision of the Act.

CLEAN WATER ACT ENFORCEMENT ACCOMPLISHMENTS

A vigorous enforcement program is essential to the successful implementation of the water pollution prevention programs established under the CWA. EPA's CWA enforcement program has been increasingly effective over the past decade. For example, in 1987, only 74% of municipal facilities had installed treatment equipment necessary to meet technology-based requirements. That number is now 97%. As a result of our enforcement efforts, the number of municipalities operating their POTW in significant non-compliance with the Act in any one quarter of a year has decreased from an average of 15% in 1986, to 8% in the second quarter of 1993.

In Fiscal Year 92, EPA took 1,450 enforcement actions under the CWA, obtaining over \$23 million in penalties. In the first three quarters of FY 93 alone, \$947,000 in criminal fines, and 288 months of criminal incarceration had been imposed against criminal violators of the CWA as a result of criminal enforcement action taken by EPA and the Department of Justice. Currently, we have 103 open cases being investigated as potential criminal cases under the CWA.

A number of recent civil judicial cases illustrate the importance of enforcement in the effort to protect the environment. Our multi-media enforcement action against the Inland Steel Company, in East Chicago, Indiana, which settled earlier this year, is a recent example of an enforcement and environmental success. The Inland facility is located on a peninsula that the company created on the shore of Lake Michigan. The peninsula itself is contaminated, as well as the sediments surrounding it on the floor of the Lake. The United States filed suit against Inland Steel in October of 1990 under the CWA, the Clean Air Act (CAA), the Resource Conservation and Recovery Act (RCRA), and the Safe Drinking Water Act. This case is the largest multi-media enforcement action brought by the Agency to date. The settlement we achieved in this case provides for a \$3.5 million cash penalty, and \$26 million in sediment clean-up and other environmental projects, *over and above* the injunctive relief necessary for Inland to attain compliance with the environmental statutes.

In the multi-media case *U.S. v. The Dexter Corporation*, EPA and the Department of Justice negotiated a civil settlement in 1992 that requires Dexter Corp. to pay \$9 million in civil penalties, \$7.2 million of which were CWA penalties. In addition to paying this penalty, and engaging in extensive corrective action at its facility, Dexter is required to conduct an extensive multi-media environmental compliance audit at its facility. The United States also brought a criminal enforcement action against Dexter Corporation for its CWA and RCRA violations to which Dexter pled guilty and was fined \$4 million.

In September of 1992, in the case of *U.S. v. Louisiana Pacific Corp.*, Louisiana Pacific ("LP") agreed to implement an all chlorine free bleaching process at its Samoa, California pulp mill. LP also paid a civil penalty of \$2.9 million (plus interest) and agreed to implement treatment measures to abate toxicity in the mill's effluent. The use of chlorine at LP's Samoa mill after September 1, 1995 is strictly prohibited, and LP will incur stipulated penalties of \$25,000/day, if it uses chlorine at this mill after the 1995 deadline. The elimination of chlorine from the mill's bleaching process is a major pollution prevention innovation, and is expected to yield significant

environmental benefits. The dioxin and other highly toxic chlorinated organic compounds generated in the chlorine bleaching process should be virtually eliminated from the mill's wastewater. When LP complies with the terms of this modification, it will be, to our knowledge, the first pulp mill in the country to convert to a 100% chlorine free bleaching process, and could set a new standard for environmental stewardship in the pulp and paper industry.

Under an agreement reached with the United States in *U.S. v. Chevron U.S.A., Inc.*, Chevron U.S.A., Inc. agreed to pay \$6.5 million in criminal fines (3rd largest in EPA history) and \$1.5 million in civil penalties, to resolve past CWA violations at Chevron's Platform Grace oil production facility, located in federal waters in the Santa Barbara Channel. A civil complaint filed against Chevron on December 29, 1988 alleged numerous violations of the CWA. Chevron had consistently violated the effluent limitations established in its NPDES permit from 1982 until 1987 as well as the monitoring and reporting requirements of its permit. The criminal case dealt with the failure to report, as well as illegal dilution and other discharges which were committed by Chevron at the Platform Grace facility. The criminal action exemplifies the Agency's commitment to the integrity of the self-monitoring system under the CWA.

CITIZEN ENFORCEMENT OF THE CLEAN WATER ACT

When discussing enforcement of the CWA, mention must be made of the crucial contributions made by citizens in enforcing against polluters. The Agency does not have the resources to enforce against every violator of the Act, not even against some serious violators. By helping to fill these gaps that the Agency and states have been unable to fill, citizens have played a very important role under the CWA by creating an additional deterrent to noncompliance. Violators of the CWA must worry about not only Federal and State enforcement, but also about a vigorous citizen enforcement presence.

Citizens have also played an important role in assisting CWA Federal enforcement by developing extremely favorable legal precedent under the Act. Many judicial decisions interpreting the statute contain language that makes it easier for the United States to resolve its CWA enforcement actions on favorable terms. The Agency has provided assistance in citizen enforcement actions, particularly in appellate matters. We look forward to continuing a positive, mutually beneficial relationship with citizen enforcers.

ADMINISTRATION THEMES FOR CLEAN WATER ACT ENFORCEMENT

As the water pollution prevention programs under the CWA have matured, the Agency has refocused its energy to better confront old and new water pollution problems. These new approaches are being incorporated into the Agency's enforcement strategies. I want to talk about three themes of this Administration for confronting water pollution in the enforcement context.

Theme 1: Pollution Prevention

Until recently, the Agency has primarily focused on attaining reductions in the amounts of water pollutants discharged by applying "end-of-the-pipe" wastewater treatment. The NPDES program relies largely on the use of technology-based and water quality-based standards in determining the amounts of treated pollutants that an industry or a municipality may legally discharge. The Agency is now focusing more of its attention on "pollution prevention" as a means of reducing the amounts pollutants discharged to the environment. Under the pollution prevention approach, a discharger achieve a reduction in pollutants released to the environment by producing less of each pollutant in the first place rather than simply by treating the wastewater. Source reductions in the quantities of pollutants used, produced, and disposed of may be achieved through a variety of means, including improved operation and maintenance of a facility to changes in the processes employed at a facility.

There are three ways in which pollution prevention is becoming an important component of CWA enforcement. First, and perhaps most important, our vigorous enforcement program has created a strong incentive for industry to embrace pollution prevention as a way to reduce their environmental liabilities. Companies have told EPA that a key reason that they invest in pollution prevention is to reduce the environmental liability associated with waste generation. A company that produces less wastewater containing fewer pollutants will greatly reduce its risk of violating the CWA.

Second, when EPA brings a CWA civil enforcement case we always require the violator to attain prompt compliance with the Act. In appropriate instances, we may

also encourage violators to implement creative pollution prevention techniques as a way to remedy the violations. Further, as part of a settlement of a CWA enforcement case, EPA may accept a smaller settlement penalty if the violator is willing to commit to implement supplemental environmental projects that incorporate pollution prevention principles and practices and compliance auditing that move the violator beyond compliance with the Act.

Third, as part of the settlement of a civil enforcement action; EPA may require the violator to conduct an environmental compliance or management audit. Such audits will often give the companies additional information to use in implementing a pollution prevention program and identifying compliance problems that must be addressed. EPA also may require companies to conduct, as part of the settlement of a case, a pollution prevention facility assessment in which the company must identify all wastestreams and investigate pollution prevention options for reducing or eliminating these wastestreams.

Theme 2: Multi-Media Ecosystem and Geographic Enforcement Targeting

Ecosystem enforcement targeting is one of the most important new directions the Agency is taking in its efforts to remedy water quality problems. The Northwest Indiana/Grand Calumet River Geographic Enforcement Initiative has been a model for addressing sensitive environmental areas with targeted enforcement. The coordinated enforcement actions taken in the Grand Calumet River basin provide an excellent example of the advantages of the ecosystem approach to enforcement. EPA has taken seven enforcement actions against various polluters as part of this initiative, under five environmental statutes including the CWA; most actions cite violations of more than one statute. The objective of this coordinated approach is the clean-up of the Grand Calumet River, including the removal of tons of sediments that have been contaminated by discharges and releases of toxic chemicals over the past century. It is by using all of our environmental enforcement tools, and by targeting all of the polluters in the river basin, that the Agency has been able to achieve such a high level of remediation of the Grand Calumet.

Theme 3: Environmental Justice

The Clinton Administration is committed to assuring that our environmental protection programs are equally protective of our citizens, regardless of their, race or class. To this end, we have begun to consider environmental justice concerns in our inspection and enforcement targeting. Environmental equity concerns played a role in our Grand Calumet River Initiative, which I mentioned previously in the context of ecosystem targeting. As is often the case in situations involving particularly egregious ecosystem contamination, the residential areas surrounding the industrial facilities in the Grand Calumet River Basin are some of the poorest areas in Northwest Indiana. Cleaning up the Grand Calumet River Basin will assist in alleviating the is proportionate environmental effects suffered by poor and minority communities surrounding these industrial facilities.

The Agency is also developing an enforcement initiative that will target waterways for which fish consumption advisories have been issued by States. Several studies have demonstrated that economically disadvantaged Native Americans, Latin Americans, Asian Americans, and African Americans may consume larger quantities of fish than is assumed in EPA'S current risk assessment evaluations. These populations may therefore be at increased risk from polluted waterways. Cleaning up contaminated waterways in these communities is therefore of great importance to the health of these disadvantaged populations.

SUGGESTIONS FOR IMPROVING THE CLEAN WATER ACT ENFORCEMENT MECHANISMS

In general, the enforcement scheme established under the CWA works well. This scheme has been revised during successive reauthorizations of the statute and has been improved on each occasion. There is still room for improvement, and there are some areas that are of particular concern to the Agency that need attention.

1. Waiver of Sovereign Immunity and Federal Facility Enforcement

In April 1992, State and citizen enforcement of the CWA against Federal facilities was adversely impacted when the U.S. Supreme Court ruled in *Department of Energy v. Ohio*, 503 U.S.—, 118 L.Ed.2d 255 (1992), that Congress had not waived Federal sovereign immunity from liability for civil, "punitive" penalties imposed by a State for past violations of the CWA (or RCRA). The Court determined that penalties are unavailable for past violations of the CWA committed by Federal facilities under the citizen suit provision of the Act and under penalty provisions of State

clean water statutes that are part of a federally approved state NPDES program. A subsequent decision, *Sierra Club v. Lujan*, 972 F.2d 312 (10th Cir. 1992), further held that penalties for past violations are unavailable whether EPA or the state issued the NPDES permit.

The *Department of Energy v. Ohio* decision made it clear that Federal facilities are not subject to the same enforcement threat which faces non-Federal entities regulated under the Act. We are concerned about this limited enforcement threat against Federal facilities, particularly in light of the 1988 General Accounting Office report that found that State enforcement actions against non-compliant Federal facilities result in increased priority of environmental compliance and prompt corrective action. (See, General Accounting Office (GAO) report, *Water Pollution: Stronger Enforcement Needed to Improve Compliance at Federal Facilities* (December, 1988)). This report also indicated that the significant noncompliance rate for Federal facilities was twice that of non-Federal facilities. Despite improvements since 1988, Federal facilities have consistently demonstrated higher significant noncompliance rates than non-Federal facilities under the CWA.

In October 1992, partly in response to the *DOE v. Ohio* decision, Congress passed the Federal Facility Compliance Act which 1) prospectively waived the Federal government's immunity from penalties for violations of RCRA occurring after the Compliance Act's effective date, and 2) provided EPA with the same RCRA administrative enforcement authority against Federal facilities as for private parties. However, this legislation did not address sovereign immunity under the CWA. The recently introduced S. 1114 provides for an expanded waiver of the United States' sovereign immunity under the CWA to overturn the results of *DOE v. Ohio*, and would establish Federal administrative enforcement against Federal facilities.

A. Waiver of Sovereign Immunity

We agree with the principle that section 313 of the CWA should be amended to prospectively waive the United States' sovereign immunity from penalties for all CWA violations occurring after the amendment's effective date by Federal facilities, and to allow states to obtain penalties for Federal facility violations occurring after the amendment's effective date of requirements in state water laws respecting the control and abatement of water pollution, but we need additional time to work with the Committee on the details of this provision. This amendment would parallel the policy of the Federal Facility Compliance Act (FFCA), which clarified the waiver of sovereign immunity under RCRA. The amendment should not alter in any manner existing agreements, permits, compliance agreements, or administrative or judicial orders. The amendment should not affect existing provisions that Federal employees are not personally liable for civil penalties resulting from acts or omissions within the scope of their official duties. Federal employees, but not Federal departments or agencies should be subject to criminal sanctions.

B. Federal Facilities Enforcement

For effective enforcement at Federal facilities under the CWA, and consistent with the Federal Facilities Compliance Act, Federal facilities should be subject to the same administrative compliance orders and penalties as non-Federal parties. The applicable Department or agencies should have the opportunity to confer with the Administrator before the administrative order becomes final. By adopting the same enforcement scheme for Federal facilities under both the RCRA and the CWA, RCRA and CWA actions can be more easily combined into one action, as appropriate, thereby simplifying enforcement for both EPA and Federal facilities and conserving scarce enforcement resources.

2. Administrative Penalty Cap

One of the great successes of the 1987 amendments to the CWA was the grant of administrative penalty authority to EPA. The result has been an increase in the overall level of enforcement activity. In 1986, prior to the amendments, EPA brought 119 civil judicial enforcement actions under the CWA. In 1992, the number of CWA actions brought was 77 judicial actions and 238 administrative penalty actions.

Further, administrative actions under the CWA are usually completed in about six months versus several years for judicial cases. Now, more than 80% of the penalty actions taken by the Agency under the Act are brought administratively, not judicially. They use only a fraction of the Agency resources required to bring a judicial case, generally require no resources from the Department of Justice, and, of course use up none of the precious judicial calendar. We are examining possibilities, including discussion of the penalty cap, for greater use of our CWA administra-

tive enforcement provisions with DOJ, with the goal of creating a more efficient, effective enforcement program. In addition, we would like the statute amended to provide authority for EPA to seek administrative penalties for violations of administrative compliance orders, with appropriate due process protections for defendants.

3. Field Citation Authority

As we have gained experience with water administrative penalties, we find a number of situations which warrant small penalties most appropriate to a field citation system. Examples that might be dealt with under a field citation system are small penalties for failure to submit a permittee's NPDES discharge monitoring report on time or for failure to submit a required stormwater permit application. A typical field citation program would involve the issuance of a citation with the specified dollar penalty to be paid by the violator. Under our existing authority, we must request public comment before the administrative penalty amount can become final, thereby preventing our inspectors from issuing a field citation at the time the violation is detected. We commend S. 1114 because it would establish field citation authority, recognizing that public comment is not needed for certain administrative penalties under \$25,000. (Review procedures, however, would be maintained, or the violator would retain all appeal rights.)

4. Remove State Enforcement Bar to Federal Actions

As presently written, the Administrative enforcement provision of the CWA provides that certain state administrative enforcement actions may serve to bar Federal enforcement. Specifically, the Act provides that a Federal penalty action, as well as citizen penalty action, is prohibited if a State has already "commenced and is diligently prosecuting" or has concluded an administrative penalty action against the same violator for the same violations. Unfortunately, this preclusion of Federal and citizen enforcement of the Act has been broadly interpreted by some courts and, especially as interpreted, is limiting the Agency's ability to assure that violators are adequately deterred. In *North and South Rivers Watershed Association v. Town of Scituate*, 949 F.2d 552 (1st Cir. 1991), the appellate court held that an administrative order issued by the Commonwealth of Massachusetts barred a subsequent citizen suit. The court so held in spite of the facts: 1) that Massachusetts is not approved to operate the point source control program under the CWA, 2) that the Commonwealth's order did not assess any penalty, 3) the Commonwealth lacks authority under that section of Massachusetts law to impose a penalty, and 4) the citizen sought injunctive relief as well as penalties. The citizens were consequently barred from seeking penalties or injunctive relief for the violations of the Act covered by the State's order. A court could find the United States to be barred as well.

The administration believes that a strong and effective partnership must be the foundation of any enforcement scheme that is to be effective. Thus, while preservation of the ability of the United States to bring a civil action against a violator, even where a state has taken an enforcement action, is an important component of an effective enforcement scheme, state enforcement efforts are fundamental to the scheme underlying the CWA. Unfortunately, State resources for enforcement are not always sufficient to assure future compliance. In some cases, the State does not have adequate enforcement resources or is unable to muster the will to adequately confront and penalize a major industry. When this is true, it is crucial that the power of the Federal government is available to insure that the violations are halted, that the violator is adequately penalized and does not profit from the violations, and that the violator addresses any environmental damage caused by the violations.

Therefore, we support the goal sought in S. 1114 as introduced by Senators Baucus and Chafee to assure that deterrence is achieved through adequate enforcement, and to promote adequate enforcement by the States, the Agency seeks revision of the statute to remove the limitation on Federal enforcement in the face of State enforcement. We will work in the weeks ahead with the staff to ensure that scarce Federal and State enforcement resources are optimally deployed where they are needed.

5. Strengthen Citizen Enforcement

As noted earlier, citizens' actions are an important component of the overall CWA enforcement effort. Unfortunately, the ability of citizens to maintain a suit under the CWA has been substantially eroded by the courts since 1987, when the CWA was last reauthorized. A 1987 decision of the U.S. Supreme Court, *Chesapeake Bay Foundation v. Gwaltney of Smithfield*, 108 S.Ct. 376 (1987), held that citizens could not seek penalties for wholly past violations of the Act, but were limited by the lan-

guage of the statute to maintaining suit for "ongoing" violations of the statute. To be ongoing, the Court ruled, there must be a reasonable likelihood, at the time the citizens file their complaint, that the violator will continue to violate in the future. We believe this should be changed to allow citizens to sue where violations are serious or the environmental consequences need to be addressed.

The decision of the Supreme Court affected not only citizen suits under the CWA, but also potentially impeded citizen suits under the CAA and RCRA. The CAA contained the same wording as the CWA. In 1990, in response to the Supreme Court decision, Congress amended the CAA citizen suit language to limit the preclusive effect of that decision by explicitly allowing citizens to maintain suit for past violations, when those violations have been repeated.

Because citizen suits are an important component of the CWA enforcement scheme, and because requiring proof of an ongoing violation has unduly complicated citizen enforcement and lessened its deterrent effect, the EPA supports amendment of the CWA to allow citizen suits for past violations of the Act. We are pleased that this amendment is proposed in S. 1114.

6. CWA Criminal Enforcement Authority

A. Knowing Endangerment

Criminal enforcement under the CWA has been very effective in punishing violators and deterring violations. Experience gained over time, however, suggests that some of the criminal enforcement provisions require clarification, refinement or upgrading to make them more consistent with other environmental statutes.

The CWA currently provides for up to 15 years of imprisonment for committing certain knowing violations of the Act and "thereby" knowingly endangering persons. (Similar knowing endangerment provisions exist in the CAA and RCRA.) There are three clarifications and modifications to the CWA's knowing endangerment provision that we recommend (none of which are addressed in S. 1114):

First, we recommend that all knowing violations of the CWA that are felonies under § 309(c)(2) be made predicate offenses for knowing endangerment under § 309(c)(3). This would ensure that all types of knowing violations of the Act may be punished appropriately.

Second, we recommend the deletion of the affirmative defense, in CWA § 309(c)(3)(B)(ii), that the conduct charged was consented to and that the danger and conduct charged were reasonably foreseeable hazards of an occupation or scientific experiment. (Similar provisions in the CAA and RCRA also should be deleted).

Third, we recommend that the language of the knowing endangerment provision be clarified to provide that any knowing endangerment "in connection with, or in the course of" a felony violation is punishable as a knowing endangerment. This clarification is needed in order to overturn an adverse judicial opinion (*United States v. Borowski*, 977 F.2d 27 (1st Cir. 1992), rehearing denied, ___ F.2d ___ (1st Cir. January 7, 1993)), in which the court gave an overly restrictive, technical reading to the knowing endangerment provision, which severely limited its application in a manner we believe Congress did not intend. (In *Borowski*, the First Circuit overturned the knowing endangerment conviction of a person who ordered employees to pour dangerous, toxic chemicals down company drains that were connected to a publicly owned sewerage system, in knowing violation of CWA pretreatment requirements. There was proof at trial that company employees actually were harmed in the course of this illegal activity, but the court ruled that their harm was not within the purview of the knowing endangerment felony because it occurred before the chemicals reached the sewer system.)

B. False Statements and Cover-ups

The CWA currently provides felony sanctions for the knowing falsification of required documentation and tampering with compliance monitoring devices [§ 309(c)(4)]. We recommend two modifications to this provision. First, we recommend that this provision be extended (consistent with provisions already in the CAA and RCRA) to include sanctions for a knowing omission or failure to maintain material information required to be filed or maintained by the Act, and of a knowing failure to install or use required monitoring devices or methods. Second, we recommend that there be a higher penalty (5 years rather than 2 years of imprisonment) when the purpose of the knowing false statement or omission is to conceal a substantive, discharge-related violation of the CWA.

C. Citizen Awards

The Agency seeks new authority to allow monetary awards to be made to those who report violations or provide information which leads to the criminal conviction

(or civil liability) of those who violate the CWA. Similar provisions already exist in other environmental statutes (e.g., Comprehensive Environmental Response, Compensation and Liability Act, the CAA, the Endangered Species Act, and the Act to Prevent Pollution from Ships), serving as an additional deterrent to violations.

D. Enhance CWA Felony Sanctions

Both the CAA and RCRA provide for up to 5 years of imprisonment for a first felony conviction (for certain knowing violations). Although knowing violations of the CWA are just as serious as knowing violations of these other laws, currently the CWA provides for only 3 years of imprisonment for first felony convictions. We believe the felony sanctions in the CWA should be enhanced in order to make them consistent and equivalent with those in the CAA and RCRA.

7. Contractor Listing

CWA § 508 currently provides that no Federal agency may enter into a contract with any person who has been convicted of any criminal, offense under § 309(c), if such contract is to be performed at any facility or site at which the violation occurred, and if such facility or site is owned, leased or supervised by such person; this prohibition continues until the Administrator certifies that the condition giving rise to such conviction has been corrected. (As Assistant Administrator for Enforcement, I am the EPA official to whom authority has been delegated to determine when the condition has been corrected, so that the violator may be removed from the List of Violating Facilities.)

S. 1114 proposes a number of significant improvements to this "contractor listing" provision. For example, S. 1114 extends the prohibition to convictions under the Rivers & Harbors Act of 1899, which will help prevent convicted violators from entering into plea agreements admitting guilt under other acts to avoid listing consequences for their acts which pollute waters of the United States. S. 1114 attempts to clarify that the prohibition may extend to more than one facility or site owned or operated by the person subject to listing and requires applicants for Federal contracts, grants, or loans to disclose affirmatively any conviction giving rise to listing under this provision. Some of the changes recommended by S. 1114 reflect policies already being implemented by EPA or are consistent with changes already made to contractor listing as a result of the amendments to the CAA which also contains a mandatory listing consequence for criminal violators.

We would also like to explore with the Committee an extension of the listing authority in accordance with the CAA listing provision, to allow the Administrator to extend the listing prohibition to other facilities owned, operated or supervised by the person subject to listing.

8. Clean Water Act Emergency Powers Provision

Each of the environmental statutes provides the Administrator of the EPA with authority to take action in response to environmental emergencies. In several respects, the emergency authorities provided to the Administrator under §§ 504 and 311(e) of the CWA are more restrictive than those provided under the other statutes. The Administration supports revisions to the CWA emergency authorities that incorporate the provisions from the other statutes. The amendments to the emergency powers provision at § 504 of the CWA proposed in S. 1114 largely meet the Agency's concerns. S. 1114 does not address the provision at § 311(e) of the CWA. S. 1114 also does not provide judicial or administrative penalties for violations of emergency orders.

EPA's most significant concerns with the CWA emergency powers provisions are that:

- § 504 does not provide EPA with the authority provided under other environmental statutes to issue enforceable emergency orders; rather, the Administrator must initiate an action in Federal court. While we support preserving emergency order enforcement authority in Federal district court, the process of initiating a court action is cumbersome and may be inadequate for responding to emergency situations;
- Present law does not explicitly provide EPA with the authority to initiate an emergency action in response to a threat posed to the environment (the current CWA emergency provision authorizes an action based primarily on threats to the public health and the welfare);
- We would also ask the Congress to clarify the law to allow EPA to invoke the CWA § 504 emergency provision of the Act when the discharge from a pollutant source "may present" an imminent and substantial endangerment even when it is not currently presenting such an endangerment. Other statutes' emergency

provisions, such as § 7003 of the RCRA, have been amended to allow an action where the pollution "may present" an endangerment. § 504 of the CWA currently allows an action only where the pollution "is presenting" an endangerment to human health or welfare;

- We also believe that the Act should explicitly provide that the emergency powers provision applies to any person, not just to those presently identified in §§ 504 and 311(e). In many instances, the source of the pollution causing the endangerment may be other than those specifically identified.
- We support allowing citizens to bring actions to address imminent and substantial endangerments.
- We favor judicial and/or administrative penalties for violations of emergency orders.

The Administration supports amending the CWA to adopt these elements that will assure the public that the Agency can respond to emergency situations in the water context as effectively as we are able in under the other environmental statutes.

9. Minimum Penalties

At present, the CWA does not establish a minimum penalty amount a court or a hearing officer must impose upon a person found liable for violations of the Act. The Act requires that the court or hearing officer consider certain factors that are set out in the statute, including any economic savings that accrued to the violator, any history of violations, good faith on the part of the violator, and the seriousness of the violations, but does not expressly state any minimum amount that must be imposed. We recommend that Congress amend the penalty provisions of the Act to require the imposition of a penalty of the economic benefit that accrued to the violator. We would suggest that a narrow exception to this rule be established, for extraordinary circumstances, including in appropriate cases, economic hardship, based on the violator's ability to pay the penalty.

Establishing a minimum penalty of economic benefit ensures that violators do not profit from their failure to install the necessary pollution control equipment that would have enabled them to comply with the Act. Economic benefit is typically calculated by determining the savings a defendant realized by delaying capital expenditures and avoiding operation and maintenance expenditures that would have been necessary for the violator to have complied. By assuring the imposition of a penalty of at least economic benefit, we will assure that this violator is not better off for having violated the Act, and consequently, not realizing an advantage relative to others in the same industry that made the necessary expenditures and complied with the Act.

The recovery of a penalty of at least economic benefit is fundamental to the Agency's approach to resolving its enforcement action. This approach should be made expressly applicable to the courts and hearing officers as well. S. 1114 does not address the issue of minimum penalties under the Act.

10. Environmental Audits

In 1986, EPA issued an Environmental Auditing Policy statement in which the Agency acknowledged the value of environmental auditing ". . . by regulated entities to help achieve and maintain compliance with environmental laws and regulations, as well as to help identify and correct unregulated environmental hazards." This document also suggested the use of environmental audits in the enforcement context. Also in 1986, EPA's Office of Enforcement issued guidance on the inclusion of environmental auditing provisions in enforcement settlements. EPA has continued to consider the appropriate use of environmental auditing for enforcement purposes. The possible uses of these audits are many, but in the enforcement context the Agency has identified two uses that would prove extremely valuable. First, environmental audits may be used to determine the causes of CWA non-compliance. In many federal CWA enforcement actions, EPA has successfully negotiated environmental audits of the defendants facility as a term of settlement. These audits are generally intended to determine the causes of the past non-compliance and to assure that the means are identified and implemented to assure future compliance. EPA has also examined the potential for auditing to be used as a tool for identifying opportunities for pollution prevention. In this context, the audit would be used to identify opportunities for pollution prevention within production and treatment processes and operation and maintenance practices at the facility.

11. Civil Injunctive Relief

Under the enforcement authorities of the CWA, the United States and citizens are authorized to seek injunctions to redress violations of the Act. Given the structure of the enforcement provisions of the Act, however, we would recommend clarifying this authority. Specifically, we would recommend enumerating in the statute itself the scope or nature of the measures that a court may order in an injunction to remedy environmental harm. The United States takes the position that a court may order the discharger to undertake all necessary measures designed to bring the facility or sin into compliance and to remedy the harm caused by a violation. This position could be strengthened if the CWA provisions authorizing courts to issue injunctions were more specific on this point. We suggest amending these injunctive relief provisions to specifically authorize courts to order clean-up of environmental harm caused by violations, and include examples such as removal of contaminated sediments.

S. 1114 provides for restoration by injunction of natural resources damaged by pollution. We support this concept but are concerned by the proposal in this bill that could set an artificially low dollar cap on the cost of restoration that a court may order equal to the maximum CWA civil penalty that may be awarded. It is our view that the cap should be at least the total cost of restoration plus up to the maximum civil penalty. Also, we recommend clarifying language in the bill that these provisions do not in any way affect the existing authority of EPA and the Corps to obtain restoration in response to violations.

12. Supplemental Environmental Projects

EPA supports amendments to the CWA which would clarify that courts and the Agency have authority to approve Supplemental Environmental Projects, projects negotiated as terms of settlement of a CWA enforcement action that are intended to benefit the environment. It is also our position that these projects should be allowed only upon the consent of the parties, and that in any case a substantial civil or administrative penalty be paid of at least the amount of economic benefit obtained before a project is allowed. We also suggest that any provision for supplemental environmental projects (SEPs) written into the statute require a "nexus" between the violation and the SEP, while not unduly restricting the scope of SEPs. S. 1114 includes provisions which authorize court's to impose SEPs in both Federal and citizen enforcement actions. Our goal with SEP's is to promote pollution prevention. We support modifying this provision so that courts are authorized only to approve consent judgments that contain SEP's, not to order them directly and not to unduly tighten the nexus requirement, precluding SEPs involving public awareness projects, environmental auditing projects, and projects that would address similar violations at other facilities or sites owned by the company, or environmental problems at the violating facility in different media.

13. Information Gathering Authorities

As provided for in S. 1114, we concur in expanding EPA's information gathering authority under § 308 of the CWA to make express the Agency's authority to obtain information from all persons who are or may be subject to regulation under the CWA, not just "the owner or operator of any point source." The Agency regulates many entities that are not point sources from whom we need to obtain information. The most glaring examples are industries that do not discharge wastewaters and therefore have achieved the zero discharge goal of the Act, and industries that discharge their wastewater to a POTW rather than to surface waters. While we believe these sources are subject to the information gathering authorities of the Act, these entities could claim that they are not point source dischargers. Our need for information concerning these entities treatment processes and compliance status is no less than for other dischargers.

We also agree with the provision in S. 1114 that would amend the Act to increase the Administrator's subpoena authority to cover any person who is or may be subject to regulation under the Act and to require such persons to give testimony or produce documentation. This provision is particularly necessary, as the scope of the CWA is broadened beyond traditional point source permittees to include other pollution sources.

14. Nonpoint Sources

Carol Browner testified before this subcommittee that one of our guiding principles for crafting a strengthened nonpoint source program should be to continue to focus on voluntary, targeted approaches supplemented by backup enforceable requirements to be triggered when necessary. We are now examining a range of mech-

anisms, including backup federal enforcement, which may address my concerns in this regard, and we look forward to working with the subcommittee members and staff to find the best solutions.

CONCLUSION

In large measure, the success of the CWA is attributable to a scheme that lends itself to simple, straightforward, reasonable enforcement, and to both strong and fair Federal, State and citizen enforcement provisions that effectively deter would-be violators. This success is also attributable, of course, to an increasingly effective CWA enforcement program at the EPA.

The improvements to the enforcement provisions that have been made by previous amendments to and reauthorizations of the statute have enhanced the Agency's ability to undertake a fair and effective enforcement effort. The amendments made in 1987, particularly the creation of an administrative enforcement scheme and an increase in the civil penalty amount from \$10,000 per day to \$25,000 per day, and the addition of felony sanctions for criminal violations, greatly increased our ability to deter violators. Adoption of the suggestions outlined above as amendments to the CWA would again improve our enforcement capabilities and assist us in doing the best job we can with the limited resources we have. The amendments we support also provide fundamental procedural safeguards to potential defendants.

I appreciate having had this opportunity to present the Agency's views on enforcement to you, Mr. Chairman and Members of this subcommittee, and I look forward to working closely with you in the upcoming months to meet the challenge of reauthorizing an improved CWA.

RESPONSES FROM MR. HERMAN FOR ADDITIONAL INFORMATION

QUESTION:

Do we have enough data now to be able to identify the state of impairment of watersheds, and therefore be able to pursue the kind of prioritization of efforts that this legislation will call for?

ANSWER:

Being able to establish priorities for watershed protection programs is an important first step. In some cases, States and federal agencies do have the information needed. However, in a number of areas we do not have adequate, consistent information. Federal agencies and the States invest considerable resources in monitoring water quality. However, we have not yet developed ways to ensure that all these monitoring efforts complement one another to produce a consistent national picture of watershed protection needs. Moreover, within and among States, some have consistent State-wide monitoring efforts, while others do not. To address these and other monitoring coordination needs, U.S. Environmental Protection Agency (EPA), the U.S. Geological Survey (USGS), other relevant federal agencies and a number of State representatives have formed an Intergovernmental Task Force on Monitoring Water Quality, which will be making recommendations over the next two years on ways to better coordinate on-going monitoring. Until this is done, prioritization of efforts under the new watershed Initiative, based on assessing where needs and opportunities are greatest, cannot be entirely consistent across the country as a whole, or within those States that currently lack consistent State-wide water quality assessment efforts.

Various sections of the Clean Water Act require States to report information needed in Watershed Management, and the EPA has consistently refined its guidance and procedures for these reports. We need to continue to refine our information to reflect recent monitoring efforts and to fill in the data gaps to satisfy our most current assessment techniques such as those needed for better aquatic biological assessments.

Briefly described below is the current status of some of the data available to watershed managers, and the efforts to provide refined or additional data:

- Several major data bases such as EPA's STORET and NWIS-II program of the USGS have considerable historical water quality data. Both of these systems are being modernized, with a key goal of being able to share information easily. These data are critical to watershed managers as they define workplans, identify impaired areas, and set priorities. EPA is working with other agencies to ensure that additional water data bases, such as those of the National Oceanic and Atmospheric Administration (NOAA), and the Fish and Wildlife Service and EPA's Environmental Monitoring and Assessment Program (EMAP) also contribute data to Watershed Management efforts.

- EPA's Waterbody System contains State assessment data—that is information about the impairment of waterbodies and whether they are meeting the uses designated by the States. (STORET contains the actual water quality data, the Waterbody System facilitates the interpretation of that data against existing State standards). EPA has been working with States to “georeference” their waterbodies so the Waterbody System can give not only information about how many waterbodies meet standards (which it can do now) but identify which actual waterbodies fall into various use attainment categories. This is critical for watershed managers and should be done over the next year. Most States have this site-specific information available, but it is not now stored in a nationally-available system.
- The USGS conducts the National Water Quality Assessment (NAWQA) Program. The goals of the program are to: (1) describe the status and trends in the quality of a large representative part of the Nation's surface and ground water resources, and (2) develop an understanding of the natural and human factors affecting the quality of these resources. This information, obtained on a continuing basis, will provide sound nationally-consistent water-quality information on which water resources decision-making at all governmental levels can be based. To meet its goals, the program will integrate water-quality information at local, regional, and national scales.
- Newer data techniques such as remote sensing and aerial photography provide data, though in many cases not on a watershed managers. Several agencies including EPA's EMAP, USGS, Fish and Wildlife Service have combined funding to buy detailed thematic mapper data for the entire country which they can then share and make available to others as allowable.
- EPA is working to make available other “backbone data” that watershed managers, and indeed, any water quality managers need to implement their programs. These backbone data include:
 - A taxonomy system, which will organize the scientific names of taxa for consistent use in inventories, is being implemented through the joint efforts of NOAA, Biological Survey is seriously considering using the system, and additional agencies and States, will be urged to use it as well.
 - Further specificity for Unit Codes (HUC), effort which EPA is supporting, to break the existing codes into smaller units, which will be of great help to watershed managers. Many watersheds are identified on a hydrologic unit basis.
 - Reach File 3, which EPA developed using USGS maps that depicts in detail the waters of the country. EPA, USGS, and States are working to jointly maintain and refine this data as necessary.

QUESTION:

Do you have any comments, either for today of for supplementation, on how the reauthorization of the Clean Water Act could facilitate advancing our ability to be able to get the kind of information that this new approach of Watershed Planning will require?

ANSWER:

The major reason we are moving to the watershed approach is that we must begin to tailor our management to the needs of specific watersheds. This will, as you have noted, require more information than we have needed in the past. The information management tools that EPA, after conferring with other federal agencies, can provide include criteria that can be used to help determine watershed targets, data standards to promote the collection and reporting of high quality data, and, in some cases, tools for its analysis.

The Clean Water Act currently provides for development of criteria for water and sediment quality by EPA. Other federal agencies can provide comments to EPA when EPA develops these criteria. These criteria will be central to watershed plans in the future. The pollutant concentrations and interrelationships reflected in criteria need to expand to guide the judgments of watershed managers. A specific example of additional need is the area of biological criteria. Criteria are being developed as we learn more about how to frame them. While much needs to be done in this regard, the Clean Water Act already gives EPA adequate authority for this work.

Data standards are being developed through a variety of mechanisms in conjunction with other federal agencies and States, local agencies and Indian Tribes through mechanisms that the administration has put into place to improve inter-governmental coordination.

Better watershed-based information collection and reporting will need these improved standards, but we must also strengthen State programs, and consolidate the process used to report water quality.

Stronger and more comparable State data would allow better assessment of trends in ambient water quality, better assessment of the effectiveness of water quality programs, and better targeting of waters needing attention for remediation or preservation. We believe that the Clean Water Act should direct EPA to work closely with the States and other federal agencies to ensure effective minimum monitoring and reporting requirements.

As we integrate EPA and State programs in support of a watershed approach, it is essential to have a single consistent and consolidated process to report water quality status of all waters, identify problem areas, set priorities for management, and identify areas which are not being comprehensively monitored. States and EPA should be encouraged to use data of acceptable quality from federal agencies and other data collectors such as municipalities, dischargers, and volunteer monitoring groups in this inventory. A single consistent and consolidated inventory would also enhance the Public's ability to participate and facilitate EPA review and approval of water quality programs.

TESTIMONY OF ROGER J. MARZULLA, PARTNER, AKIN, GUMP, STRAUSS,
HAUER & FELD, WASHINGTON, DC

Mr. Chairman and members of the Committee:

I am pleased to accept this subcommittee's invitation to discuss the enforcement provisions of the proposed Federal Water Pollution Prevention and Control Act of 1993, S. 1114. I offer to this Committee a perspective gained over many years as both a government attorney responsible for prosecuting such cases, and as a private attorney defending them. From 1983 to 1989 I served in the Environment and Natural Resources Division of the U.S. Department of Justice, heading the division from 1987-1989. While at the Department of Justice, I personally prosecuted and defended several Clean Water Act cases (including citizens suits), and was responsible for overall enforcement strategy under the Clean Water Act (as well as the other major, environmental statutes). Now, as head of the environmental law section in the Washington office of Akin, Gump, Strauss, Hauer and Feld, L.L.P., I defend such cases brought against my clients. My experience also includes litigation of civil and criminal enforcement cases, and the defense of citizens suits brought under all of the other major federal environmental statutes.

Success of the Clean Water Act

The dramatic improvement in the quality of our nation's waterways, lakes and coastlines over the past 20 years qualifies the Clean Water Act as perhaps the most successful of our nation's environmental statutes. The rates of compliance with statutory requirements are high, due in no small part to the deterrent effect of the federal clean water enforcement program. The existing enforcement provisions of the Clean Water Act have enabled the United States to impose significant monetary penalties that far outweigh the economic benefit of noncompliance, to obtain injunctive relief that ensures future compliance, and to sanction habitual non-compliers by disqualifying them from obtaining government contracts and other benefits. The enforcement provisions of the Act have enabled EPA and the Department of Justice to institute coordinated nationwide and regional initiatives to address stubborn areas of noncompliance: metal finishers, combined sewer overflows, industrial pretreatment and municipal sewage treatment, to name a few.

This is not to say that no improvement of the enforcement provisions can be made; however, such changes must be made very carefully to avoid injuring an enforcement system that has to date performed well.

Administrative Enforcement

Increasing the maximum allowable administrative penalties and field citations will enable EPA to address the myriad of minor technical violations of the Clean Water Act expeditiously. The heart of the Clean Water Act enforcement program is the requirement that a permittee perform self-monitoring and self-reporting of violations, leaving only the issue of penalty to be decided. Where those violations have a negligible effect on the environment and are not persistent, the enforcement program is best served by the informal processes of field citation or administrative penalty assessment. This streamlined enforcement program for minor offenses frees investigators and enforcement attorneys to concentrate upon major violations, while

increasing substantially the number of minor violations that the Agency is able to address. Industry and municipalities, too, avoid the substantial costs of lawyers and litigation by bringing minor violations to resolution promptly and informally through direct discussions with EPA.

Citizens suits: Abuse and Misdirection

The citizens suit provisions of the Act (section 505) have, in contrast, encouraged misuse which has diverted the attention and resources of both the government and private industry from critical water pollution priorities. Section 505 creates significant financial incentives for the bringing of actions based upon technical violations whose impact on the environment is negligible. Those incentives include:

- Substantial awards of attorneys' fees at rates charged by major law firms even where the case is prosecuted by modestly-compensated environmental group lawyers;
- The diversion of penalty amounts into "environmentally beneficial projects," often benefiting the plaintiffs in the lawsuit directly or indirectly.
- Recordkeeping and strict liability provisions, insuring that the plaintiff has won the case before it is filed and requiring very little work to prepare and prosecute.

The majority of these cases are brought against industrial facilities (usually large companies) who have self-reported permit violations, so that the only issue is the appropriate amount of penalty. Industry, anxious to resolve the case, usually negotiates a generous attorneys' fee award to the plaintiff group, together with a significant reduction in penalties payable to the U.S. Treasury in return for an "environmentally beneficial project" frequently an outright monetary contribution to a designated group or university" chosen by the plaintiff. In recognition of this abuse, Congress in 1987 amended the Clean Water Act to require that proposed consent decrees in Clean Water Act citizens suits be submitted to the Department of Justice for review forty-five days prior to court approval (FWPCA § 505(c)(3), 33 U.S.C. § 1365).

Such citizens suits divert substantial resources (both private and governmental) from addressing true water pollution priorities. First, the threat that the case will be brought as a citizens suit if the government does not bring it as an enforcement action tempts EPA to dedicate scarce enforcement resources to actions it might otherwise not bring, since EPA knows that it will suffer embarrassment and lose much of the penalty if the citizens group brings the case instead. Second, private financial resources (often in the millions of dollars) are spent on these suits rather than addressing more pressing environmental concerns. Third, the incentive for industry is to "pay off" the plaintiffs and resolve the litigation even where this leaves pollution control problems inadequately addressed. Fourth, EPA and the Department of Justice must invest substantial personnel resources in reviewing these cases and, on occasion, objecting to proposed consent decrees which violate government policies and priorities.

Finally, and most importantly, citizens suits pull against government priorities and enforcement strategies. By definition, a citizens suit is a claim of violation of the Clean Water Act which, in the opinion of EPA, did not merit filing. Out of many thousands of potential cases, the government must choose those best aimed at achieving and maintaining the integrity of our nation's waters, and at deterring violations by others. The citizens suit provision authorizes the bringing of cases which do not fit into this enforcement strategy and which, in many instances, detract from it. The large environmental groups who bring the vast majority of these cases—Sierra Club, NRDC, PIRG, and Atlantic States Legal Foundation—have their own environmental agenda different from that of the government, which they attempt to implement as "private attorneys general." The result is like several horses each trying to pull the carriage in a different direction—and that direction is not the one carefully mapped out by EPA and the Department of Justice pursuant to the direction of Congress and answerable to the public. A consequent jumble of priorities, strategies and inconsistent resolutions characterize the history of the Clean Water Act's citizens suit docket.

The Clean Water Act's citizens suit experience is not unique among environmental statutes. To avoid precisely this kind of disruption in the government's program, Congress adopted section 113(j) of the Superfund Amendments and Reauthorization Act of 1986, depriving federal district courts of jurisdiction over Superfund citizens suits brought while a remedial action is in progress. This subcommittee may wish to consider similar restrictions upon the unbridled bringing of Clean Water Act citizens suits.

The "Gwaltney Fix"

An excellent example of this misdirection of enforcement policy and misallocation of resources is the proposed revision to the citizen suit provision of the Clean Water Act to permit the bringing of actions based wholly upon passed violations which have ceased and are not likely to be repeated in the future. Of course, in such cases the federal or state government has complete authority to recover penalties. However, where the government has declined to pursue such a case, little reason appears for allowing a private party to bring the action.

First, the case raises significant constitutional issues under the Article III "Case or Controversy" clause of the U.S. Constitution. Where the violation exists entirely in the past and the only remedy sought by the plaintiff is a penalty payable to the U.S. Treasury, there would appear to be no injury to the plaintiff redressable by the federal district court. In contrast to a case involving current or threatened violations which may be abated by injunctive relief, such a "passed penalties only" case is moot, and the plaintiff lacks standing to pursue this presently nonexistent discharge in federal court. Second, such cases are a vivid example of citizens suits which divert resources and energy from legitimate environmental priorities, serving principally as a vehicle for enriching the plaintiff group. Where the cause of the violation no longer exists because the permittee has remedied it, and where the government has declined for good reason to prosecute the case itself, there exists small reason for a private party to bring the case other than to profit from the substantial attorneys' fees and diversion of penalties into an "environmentally beneficial project."

Although the abatement of current or threatened violations of the Clean Water Act may be said to legitimately support a citizens suit, the filing of a "passed penalties" case (forbidden by the Supreme Court's Gwaltney decision) vindicates no legitimate environmental protection objective. Accordingly, a provision allowing such suits should not be adopted by Congress.

"Environmentally Beneficial Projects" Should Not Be Authorized

The Clean Water Act authorizes the recovery of civil penalties of up to \$25,000 per day for each violation of the Act, together with injunctive relief to abate the violation. The Act does not authorize the diversion of these penalties from the U.S. Treasury to privately-run activities or projects. Allowing a plaintiff group to trade-off funds owing to the U.S. government in the form of penalties in return for defendant's contribution of funds or property to an activity of the plaintiff group's choosing is poor policy which is ripe for abuse.

First, the diversion of tens of millions of dollars per year in funds otherwise payable to the U.S. Treasury in the form of Clean Water Act penalties undercuts our nation's efforts to resolve its serious budgetary problems. For this reason, Congress, in the 1990 Clean Air Act amendments limited such "environmentally beneficial projects" to a maximum of \$100,000.

Second, "environmentally beneficial projects" minimize the financial sting intended by Congress' authorization of stiff civil penalties. Companies often enthusiastically agree to perform improvements on their own facilities, donate property for parks or refuges, or make financial donations to environmental groups in return for the groups' agreement to give away penalties otherwise owed to the U.S. Treasury. The company often gains a tax deduction and the ability to tout its environmental sensitivity, while avoiding significant cash outlays for penalty payments.

Third, such projects represent the whim of the individual or group bringing the action, disconnected from legitimate public policy considerations. At a minimum, Congress should require some nexus between the violation and the project to ensure that large sums are not wasted on useless or foolish undertakings.

In short, since environmentally beneficial projects often represent "hobby horses" of those bringing the suit, they should be discouraged. Since the true purpose of penalties is to punish violators of the Clean Water Act, using the threat of such penalties to obtain funding for pet projects undercuts rather than serves the fundamental deterrent function of the enforcement provisions.

Natural Resource Restoration: A Black Hole

The bill's provisions for injunctive authority to restore natural resources raise the specter of another Superfund debacle clothed in Clean Water Act provisions. The historic power of the federal government to obtain remediation of contaminated sediments, shellfish beds, marshes, injured vegetation, wetlands and similar environmental damage has proved quite sufficient over the years. No reason exists for creating a sweeping and nebulous new authority, devoid of standards or legislative purposes.

First, the natural resources restoration provision, section S. 1114, § 503, contains no requirement for regulations defining the damage to be remedied, or the process by which the damage is to be assessed. Statutes such as CERCLA, MPRSA and the Oil Pollution Act contain carefully structured processes, and definitions for defining natural resource damages which must be remedied.

Second, the bill contains no liability standards or burden of proof. It could be read to suggest that an injunction may be obtained requiring a single violator to restore an entire lake, marsh, or riverine system, without contribution from other polluters of the same aquatic system. It might also be read to authorize vast actions against thousands of non-point sources (e.g., farmers or homeowners) to require restoration of aquatic ecosystems such as the everglades.

Third, the inclusion of such language would appear to call into question existing governmental authority (successfully used for the past two decades) to require clean-up directly traceable to the violator.

Fourth, the provision's lack of specificity portends years of litigation (similar to that surrounding CERCLA) in which issues such as joint and several liability, strict liability, definition of "natural resources" and definition of "restoration" are fleshed out at huge expense in time and litigation costs over several years.

In short, current authority is entirely adequate. Adding the natural resources restoration provision will only confuse the program without providing any benefit.

Other Issues

Finally, I would address briefly three additional issues:

(1) *Black listing.* The bill would disqualify from government contracting any company convicted of a single criminal violation or three civil violations of the Clean Water Act. Such automatic disqualification would capture a company which was merely negligent, or even a non-negligent company held liable for a strict liability violation of the Clean Water Act which is, nevertheless, criminal (S. 1114 § 503). Disqualification from government contracting (which may be tantamount to bankrupting a company dependent upon government contracts) should not occur on the basis of an unpermitted discharge that was unintentional and, in effect accidental.

(2) *Upset provisions.* S. 1114, § 593 would require that an upset (i.e., an unintended malfunction of the waste water treatment system) be treated as a violation of all of the parameters of the permit rather than as a single violation of the permit. Since each violation is punishable at up to \$25,000 per day, and a permit may easily include a dozen or more parameters, the daily penalty in such an accidental upset case could be astronomical. There appears no good reason for changing existing law.

(3) *Criminal enforcement.* The Clean Water Act provides insufficient guidance regarding what is criminal and what is not. In addition to the strict liability and negligence crimes discussed above, the Act provides essentially that any violation of the permit requirements may be prosecuted criminally. In the context of wetlands prosecutions especially, this statute has provided prosecutors with no guidance whatever regarding those acts which Congress deems sufficiently egregious to be prosecuted criminally and those acts which are merely punishable by a fine. Congress should undertake a better definition of criminal activity so as to avoid uncertainty and arbitrariness.

In conclusion, I appreciate the Subcommittee's invitation to testify today, and I would be happy to respond to any questions.

STATEMENT BY ADRIAN FREUND, DIRECTOR OF THE LOUISVILLE-JEFFERSON COUNTY DEPARTMENT OF PLANNING AND ENVIRONMENTAL MANAGEMENT

Chairman Applegate and distinguished members of the Subcommittee on Water Resources of the House Committee on Public Works and Transportation. I am Adrian Freund, Director of the Louisville-Jefferson County Department of Planning and Environmental Management in Louisville, Kentucky. Prior to assuming my present position in July 1992, I served as Chief of Water Management for the Connecticut Department of Environmental Protection. I have 21 years of experience in urban and regional planning, environmental planning and environmental management, with a concentration in water quality management. I hold a Bachelor's degree in Urban and Regional Planning from the University of Illinois.

On behalf of the American Planning Association (APA), I am here today to present the Association's views on reauthorization of the Clean Water Act. I respectfully request that the complete text of my statement be included in the official hearing record.

APA is a national public interest and professional organization consisting of public and private planners, elected and appointed officials at all levels of government, as well as educators, students and interested citizens. Our 28,000 members belong to 45 chapters covering every state and Congressional district.

APA was formed in 1978 when the American Institute of Planners, established in 1917, and the American Society of Planning Officials, founded in 1934, were consolidated. The Association's primary objective is to advance the art and science of planning for the improved development of the nation and its communities, states and regions, as well as to preserve its valuable natural resources. Within APA is the American Institute of Certified Planners (AICP) which focuses on professional development.

The American Planning Association and its 28,000 members have a great interest in the wise protection of our nation's water resources. Our testimony is based, in part, on APA's adopted policy on Environmental Quality. APA has also developed policies on: Comprehensive Surface Water Management, Groundwater Quality and Quantity Protection; and Wetlands. APA's policy on Environmental Quality seeks to achieve:

- the conservation of non-renewable resources—such as mineral petroleum and agricultural lands—and the protection of renewable natural resources, such as surface and groundwater, air, topsoil, forests, and fisheries from further degradation or destruction.
- the integration of environmental protection and environmental policies and programs into comprehensive and functional planning and implementation programs at all levels of government throughout the nation.
- special protection for sensitive areas: wetlands; floodplains; areas supporting unique or endangered plant and animal species; sites of special scenic, historical, and archaeological significance; and lands or waters that would lose their value or be permanently impaired by human changes.

Specifically, in relation to water, APA's adopted policies include the following provisions:

1. Areawide planning and implementation of water quality management and water supply are critic. Federal funds should be provided to regularly update areawide plans. Because waters are not confined by local, state, or national boundaries, purely local efforts to improve water quality and/or supply are ineffective.

2. Federal funding for the construction and upgrading of publicly owned wastewater treatment plants must be continued. Publicly owned plants often support new growth and development and their construction provides jobs. Unlike scattered, private wastewater plants, public facilities often reinforce centralized growth and in fill, and prevent urban sprawl and water quality degradation. Furthermore, Federal construction funds should be consistent with areawide water quality plans which stipulate that any new growth and development to be served is necessary and environmentally sensitive.

3. Data collection and analysis of existing conditions should be supported by federal funds. There can be no sound decision on how to maintain and enhance water quality and supply without adequate data collection and analysis. Locally funded monitoring programs fail due to competition for scarce resources.

4. Federal funds should be available to small and financially-strapped communities to avoid geographic inequities and to prevent economic hardship. Areas of the nation with exceptionally sensitive bodies of water, large concentrations of waste producing industry, or large low-income populations should not suffer diminished environmental quality because of an inability to pay.

5. Research on the effects and magnitude of nonpoint source pollution and the effectiveness of control strategies should be continued. The Section 319 program should be expanded beyond demonstration. Integrated Watershed Planning approaches to point and nonpoint source control should be promoted. Proposed projects and land use activities should be evaluated for their contribution to nonpoint source pollution; and efforts to minimize adverse effects should be encouraged.

A Planning Perspective on the Clean Water Act

Two years ago, the American Planning Association came before your Subcommittee to present a planning perspective on the Clean Water Act reauthorization. In our testimony, we stressed four basic premises that underlie our positions on the Clean Water Act and our adopted policies on water management. Those premises, equally valid today, are:

1. Water quality is fundamentally related to land use and land management.

The business of planners and planning is to apply foresight to the way land is used and managed. Increasingly, environmental protection is an integral part of the

process of developing comprehensive plans at all levels of government. Our communities' use of land directly impacts water quality. Some impacts come from point sources while others come from broadly dispersed or "nonpoint" sources. Land use planning is undertaken by nearly all units of government and used to establish the basis for zoning and development regulations. Increasingly, infrastructure investments in wastewater facilities are used as a tool to help shape and guide urban growth and reduce the negative impacts of urbanization on water quality.

2. Efforts to clean up polluted water require extensive capital investments.

Long-range capital planning of at least five to six years is needed at every level of government. Stable funding of infrastructure programs at the federal level is essential to secure large and stable capital commitments from state and local governments.

The benefits of local and regional clean water accrue to the nation as a whole. Financing of water management facilities and programs is a federal as well as local and state responsibility. The state revolving fund (SRF) program has been highly successful in stimulating the construction of new facilities to attack water pollution. Without the SRF, state and local governments could not afford to make the massive investments required to achieve water quality standards. The 1987 Clean Water Act Amendments introduced nonpoint sources, combined sewer overflows, sludge management, stormwater and toxics as new needs to be addressed by the states. Addressing these problems will require large new capital investments throughout the next two decades. Stable federal funding is essential.

3. Water quality and water quantity are directly interrelated. Water quality is irrevocably tied to the amount of clean water available for drinking, industrial and agricultural uses.

Polluted water is not readily available for drinking and must often be subjected to costly treatment processes to make it suitable even for industrial and other uses. Since surface and groundwater are closely interrelated, the quality and quantity of groundwater can directly impact surface water as springs feed the streams and rivers, especially in time of drought. Surface and groundwater withdrawals for consumptive use reduce flows in rivers and streams and may seriously compromise the achievement of aquatic life and recreational use goals in large areas of the nation.

4. Wetlands in their natural state perform ecological functions that are impossible or costly to replace and are vitally important to the environment and economic health of the nation.

Wetlands protect the quality of surface waters by retarding the erosive forces of moving water, and by intercepting and reducing waterborne sediments, excess nutrients, heavy metals and other pollutants. Several states in our nation have developed outstanding wetland protection programs that recognize the critical functions that wetlands play in maintaining water quality and providing habitat for wetland dependent and transitional plant and animal species. Wetlands protection is a fundamental land use management function in which the federal government must provide leadership. State and local governments must play supporting roles.

Last year, APA came before this Subcommittee to testify on the merits of H.R. 5070, the "DeLauro-Lowey Water Pollution Control and Estuary Restoration Financing Act." In our testimony, we noted that the outstanding work of your esteemed colleagues offered an opportunity to better integrate planning and development decisions at an ecosystem or "bioregional" level. Commenting on the work of Representatives DeLauro and Lowey in a recent letter to APA, Majority Whip David E. Bonior noted that the "Congresswomen . . . recognized early that careful planning can help to maximize the environmental and economic benefits of expenditures on environmental infrastructure." Congressman Bonior, commenting on Congresswomen DeLauro and Lowey's recent efforts to develop a strategy for expediting infrastructure funding, notes that the proposal "will focus on giving priority to projects that emerge from sound planning efforts.

President Clinton's budget contains a major economic stimulus package that focuses on infrastructure investments as a way to create jobs, promote economic development and meet environmental goals. Those projects that are "ready to go" under the administration's program will undoubtedly be the same projects that have benefited from careful planning.

The Merits of a Watershed Planning Approach

There are many signs that the benefits of sound planning are becoming more widely recognized. The National Estuary Program requires "Comprehensive Conservation and Management Plans" as a basis for making decisions about investments and regulatory programs that are needed to clean up waters of special national significance. Under Section 319 of the Clean Water Act, states create nonpoint source

management plans to establish priorities for investments in best management practices, land management programs and land use initiatives. Wastewater facilities plans have been part of the clean water vocabulary since the 1970's.

Throughout America, hundreds of watersheds provide examples of the application of planning approaches to watershed and water quality management. I have developed watershed programs in places as diverse as Austin, Texas; Madison, Wisconsin and the State of Connecticut. In my own area of Louisville and Jefferson County, Kentucky, a unique and sensitive watershed known as Floyds Fork has been protected from the pressures of urbanization. The Floyds Fork Program was led by David Armstrong, County Judge/Executive and uses zoning and development standards and policies to protect the character of the watershed and prevent water quality degradation.

In 1991, the State of North Carolina's developed a *Whole Basin Approach to Water Quality Management*. Throughout 1991 and 1992, state water managers, water interest groups, APA and several federal agencies began to focus upon the concept of a watershed basis or basin approach to water quality management as a new organizing framework for the Clean Water Act. Last week, over 900 persons participated in an EPA conference on the subject of Watershed Planning and management. Sound, integrated planning of ecosystems or "bioregions" is at the heart of the watershed approach.

The American Planning Association has developed a conceptual framework for a watershed approach to clean water (copy attached) and strongly supports the concept as a effective tool to coordinate and integrate the many programs required by the Clean Water Act National Pollutant Discharge Elimination Systems (NPDES) permitting, monitoring, water quality modeling, nonpoint source assessment, waste load allocation, best management practices and planning requirements can be integrated throughout a watershed. Water quality and aquatic resources can be assessed simultaneously throughout an entire river basin.

The benefits of whole basin or Watershed Planning and management fall into three major categories: (1) improved program efficiency, (2) increased clean water program effectiveness, and (3) consistency and equitability. By focusing on specific areas of concern each year, monitoring, modeling, and permitting efforts can be focused; as a result, more can be achieved for a given level of funding and resource allocation. The whole basin approach is consistent with basic ecological principles of Watershed Management, leading to more effective water quality assessment and management. Linkages between aquatic and terrestrial systems are addressed (e.g., contributions from nonpoint sources) and all inputs to aquatic systems, and potential interactive effects are considered.

Watershed Management will facilitate the incorporation of nonpoint source pollution assessment and controls, since these diffuse pollutant sources extend to the watershed boundaries and accumulate from a basin's headwaters to its mouth. Watershed plans will provide a focus for management decisions. By clearly defining long-term goals and approaches, these plans will encourage consistent decision-making. Consistency, together with greater attention to long-range planning, in turn will promote a more equitable distribution of the assimilative capacity of a water body, explicitly addressing the trade-offs among pollutant sources (point and nonpoint) and allowances for future growth.

North Carolina is but one of many states that are exploring or have implemented watershed-based water quality management programs. Currently, many of the Clean Water Act requirements for reporting and planning can be satisfied through a whole basin or Watershed Management approach. Some of the Clean Water Act requirements that could be more effectively addressed through a whole basin approach include:

- *Section 302—Water Quality based effluent limits.* Under a watershed approach, alternative effluent control strategies could include approaches such as assimilative capacity "banking."
- *Section 304(1)—Impaired Waters.* A watershed approach would include a comprehensive analysis of all the inputs to a watershed that may cause degradation. More objective priority setting and improved management strategies are the benefits.
- *Section 305(b)—Water Quality Inventory.* A comprehensive assessment of water quality in each watershed is generated through a whole basin approach.

Sections 201, 303, and 319 of the Clean Water Act require or strongly encourage a watershed approach to water quality management. However, a piecemeal approach to implementation of the Act, a fragmented approach to funding and grants and a variety of separate reporting requirements have discouraged states and localities from pursuing integrated watershed-wide approaches.

It is the position of the American Planning Association that barriers to carrying out watershed-based planning should be identified by Congress and removed during the reauthorization process.

Additional Recommendations for the Reauthorization

The American Planning Association has developed several additional recommendations for the reauthorization.

1. The planning process for controlling nonpoint source pollution needs to be improved.

We recommend consistency between local land use plans and state water quality plans including nonpoint source reduction. The federal nonpoint source program must shift its emphasis from demonstration to long term management of nonpoint sources.

The Clean Water Act should require that localities receiving or qualifying for federal assistance establish a nonpoint source management strategy. The statewide (Section 319) nonpoint source plans should reflect participation by regional planning agencies and local government in nonpoint source planning. The Act should either set forth in detail the criteria that the Environmental Protection Agency (EPA) must use in certifying that a state plan is adequate, or require EPA to promulgate regulations setting forth such detailed criteria. The program could follow the model established by the requirement for a coastal area water quality element in the Coastal Zone Management Act.

States should require regional agencies and local governments to certify that their existing plans are consistent with state nonpoint source management plans, or require regional and local governments to prepare and implement new nonpoint source management plans consistent with the state plan. States should certify to EPA that they have reviewed both regional and local plans and found them consistent with state plans. Consistency of federal projects should be required before capital improvement funds are released for major federal facilities, including federally assisted highway projects.

Congress should appropriate sufficient funds to allow EPA, states, and local governments to successfully administer the nonpoint source control program. Such administration should go beyond the current situation to anticipate meeting future needs.

Grants are also needed so the states and local governments can prepare and implement high quality nonpoint source reduction plans. The Section 319 nonpoint source program should emphasize institutionalizing nonpoint source control, as contrasted with the current focus on demonstration.

2. We support providing opportunities for joint management of ground and surface water supplies and believe that state water plus that address surface and groundwater quality and quantity should be required.

Federal grants are needed to fund research on strategies for joint management of ground and surface water that also integrate principles from the Safe Drinking Water Act. We need to start looking at the resource on an ecosystem basis.

The Clean Water Act should take first steps toward requiring state water plans that address surface and groundwater quality and quantity. The plans should provide for in-stream flow quality and quantity standards for the purpose of preserving and enhancing fish and aquatic life. The revised Act should also contain special provisions for ephemeral and intermittent watercourses with standards appropriately based on the sources of water.

Federal funding for any water project should be approved only when state water plans can demonstrate consistency with other state planning programs such as growth management, clean air and solid waste management. Local wastewater facility plans submitted to the state for funding under the state revolving fund must be consistent with local air, water, solid waste management and growth management plans (where they exist). Local land use planning needs to take into account water quality and quantity. The plans should guide development to be compatible with protection of recharge areas, conservation of aquatic habitats, surface water quality, stormwater runoff and take into account cumulative and synergistic effects.

3. The federal government should establish a long-range capital planning budget, at least five to six years in scope, as a basis for appropriating funds to the State Revolving Fund (SRF) for building and upgrading the many public works projects necessary to achieve the objectives of the Clean Water Act. For communities in economic hardship, additional SRF funds should be made available and payback periods should be extended.

The large unmet need for construction and upgrading of wastewater treatment plants requires additional investment by the federal government in the state revolving fund (SRF). The SRFs must also address new needs such as combined sewer correction, stormwater, nonpoint sources and sludge management. The federal government should give special consideration to assistance for public works projects that are included in adopted local and state capital improvement programs of state and local governments that are linked to longer-term state development plans and local comprehensive plans.

4. The State Revolving Fund (SRF) program should be continued at least through 1999, with federal capitalization funds of at least \$2 billion annually. Additional funding comprising a total of \$5 billion annually should be provided as part of an economic stimulus program targeted at infrastructure. The continuation of funding should address the unmet needs included in the 1987 Clean Water Amendments.

The 1987 Clean Water Act Amendments introduced nonpoint sources, combined sewer overflows, sludge management, stormwater and toxics as new capital needs to be addressed by the states. Continuation of capitalization grant appropriations at the current level of approximately \$2 billion annually through 1999 will allow SRFs to address many of these unmet needs mandated by the 1987 Act. Additional funds should be appropriated and any program that also addresses drinking water needs should be funded at levels of up to \$5 billion.

5. A goal of no overall net-loss of the nation's remaining wetlands resource base as defined by acreage, volume, location, type and function should be adopted. Where feasible, federal legislation should support actions to enhance, restore and create wetlands using a "partnership" approach that incorporates private stewardship and federal, state, and local cooperation.

APA supports language in the new Clean Water Act to protect wetlands and to promote the development of EPA-assisted, funded and approved comprehensive wetland management plans at the state, regional and local levels. These plans must ensure intergovernmental coordination and achieve the no net-loss goal. That also means that federal activities must be consistent with EPA-approved state and local wetland management plans.

We recommend allowing and encouraging states, regional and local government entities to assume responsibility for specific portions of the Section 404 program and other future legislated programs so long as they demonstrate a capacity to further the national goal of no-net loss and adopt approved state wetlands management plans. Local governments should be allowed more direct participation in both the regulation and management of wetlands based upon a clearly defined wetlands inventory and classification system.

We urge you to establish a comprehensive program that supports tax-based and other financial incentives to encourage landowners, land trusts, states, and local governments to protect wetlands, and provide funds for public and semi-public acquisition of wetlands in full or in part, as appropriate. Planning techniques such as cluster zoning and transfer of development rights and other innovative land use incentives need to be encouraged to accomplish the preservation of wetlands.

The Clean Water Act should encourage states and local governments to establish mitigation banks for unavoidable losses of wetlands. Federally funded projects, especially transportation facilities, including those funded by the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA), should be designed to avoid unnecessary wetland losses. Mitigation for unavoidable losses should be eligible for federal funds.

6. To further the intergovernmental partnership that implements the Clean Water Act, we support adequate federal funding for the states and local governments to carry out and manage significant new mandates.

States have a key role in the federal Clean Water strategy. States have carried out the basic requirements of the Act for nearly 20 years with considerable progress. Federal support of state program management, however, has dwindled in recent years, and states must now take on new responsibilities for stormwater permitting, nonpoint sources, toxics and other mandates of the 1987 Act.

The management needs of states are estimated to be at least \$700 million annually. Federal appropriations for Section 106 must be dramatically increased from their current level. Local governments also need more money and support from the federal government so they can carry out their role under the Clean Water Act as well.

CONCLUSION

Let me conclude by thanking the Chairman for inviting the American Planning Association to testify before your Subcommittee, thus providing the planning profes-

sion an opportunity to share with the Subcommittee our thoughts and expertise on the Clean Water Act. I would also like to recognize the Government Affairs staff of APA here in Washington, D.C. for their fine efforts in focusing greater attention on the importance of sound planning. We believe that the Congress can substantially improve the Clean Water Act by integrating the planning approaches advocated by APA into the Act.

Other recent models, such as the Intermodal Surface Transportation Efficiency Act (ISTEA), demonstrate the merits of a participatory, integrated federal/state/local planning partnership.

I would be more than happy to address any questions you may have.

WATERSHED BASIS FOR CLEAN WATER

Prepared for the American Planning Association, by Margot W. Garcia, PhD, AICP, Department of Urban Studies and Planning, Virginia Commonwealth University, in consultation with Charles Wolfe and Keene Callahan of Robinson & Cole, Hartford, Connecticut and Arlan Colton, State Land Department, Tucson, Arizona.

Despite massive efforts at point-source pollution control which has resulted in considerable improvement, the rivers and lakes of the United States still are not fishable and swimmable. Non-point source pollution from urban, agricultural and industrial runoff has become the greatest problem. The waterways and wetlands of our nation are an indispensable and irreplaceable but fragile natural resource with which the citizens of the nation have been endowed. These are an interrelated web of nature essential to an adequate supply of surface and groundwater; to hydrological stability and control of flooding and erosion; to the recharge and purification of groundwater; and to the existence of many forms of animal, aquatic and plant life.

The quality of our nation's water is a historical reflection of land uses which requires new and innovative solutions to address the problem. What follows is a conceptual model for watershed based planning and management to reach the nation's goal of the protection of the physical, biological and chemical integrity of our nation's waterways.

I. General Assumptions

- We need to approach this problem from a "systems" point of view, meaning dealing with the complete hydrologic system of precipitation, surface and groundwater, wetlands, lakes and ponds, and estuaries. The systems approach forms one of the references for planning and management.
- The definition of "clean" needs to come from a risk-based analysis.
- With very few exceptions, land use decisions have been historically made at the local level with active and informed citizen participation. This process is strongly supported by citizens.
- Definition and analysis of problems and forecasting of trends needs to be based on the best science available. A basic inventory of ecosystem characteristics and functions is essential as well.
- Water quality and water quantity are interrelated. Upstream activities determine the limits within which downstream activities may be carried out. The quantity of water cannot be divorced from quality for purposes of beneficial use, and quality is conditioned by the quantity available.
- In order to adopt and implement this "systems" approach, all the parties who will be affected need to be at the table to agree on the definition of the problem and to negotiate the strategies to resolve the issues identified.
- The Water Resources Planning Act of 1965 by creating a cooperative framework between the federal government, states, local governments and private enterprise established a Federal-State framework to manage and protect river basins. We need to build on that experience.
- While there is a need to establish institutions based on watershed or ecological boundaries, creating new governmental structures should be avoided. One way to avoid creating new structures is to modify existing ones.
- The existing point and nonpoint National Pollutant Discharge Elimination System (NPDES) permit system should stay in place. The Section 404 and 401 permits system of the Clean Water Act should be modified. Flexibility of these systems during transition to a watershed-based approach is necessary.

II. A Conceptual Framework

The watershed systems approach provides the basis to (1) analyze water quality and quantity problems, (2) implement land use and environmental planning strategies to overcome these problems, and (3) monitor the progress and success of the

watershed system approach in order to adjust the strategies as needed. To be effective and comprehensive, watershed boundaries would overlay existing political boundaries of states, counties and municipalities. These political jurisdictions within one watershed would need to work together under new institutional arrangements.

The watersheds systems approach is an attempt to achieve the goal of "fishable and swimmable" under the Clean Water Act.

The U.S. Geological Survey (USGS) has a system for classifying watersheds as they aggregate into larger systems, which was used in part by the Water Resources Council (WRC). There are 21 river basins in the U.S. which would report to EPA. The "river basins" would form the largest regional areas. Planning and coordinating of watershed plans would occur at this level. They would also be responsible for setting water quality standards and administering the NPDES permit system in accordance with approved watershed plans.

The next level of management or coordination of watershed activities would be "planning subregions." This is an area drained by a river system, a reach of a river and its tributaries in that reach, a closed basin(s) or a group of streams forming a coastal drainage area. The WRC had set up 222 of these planning subregions (later consolidated to 106 assessment subregions).

The "accounting unit" is nested within or equivalent to a planning subregion. It is used by the USGS for designing/managing the National Water Data network. The WRC had set up 352 accounting units. In a small riverine basin these might be equivalent to the planning subregions. This is the level that would be responsible for issuing Section 404 and 401 permits for development projects, making sure that the permit issuance is consistent with the metropolitan planning organization (MPO)/council of governments (COG)/hydroregion plan and its Best Management Practices (BMPs).

Representing part or all of a surface drainage basin, a combination of drainage basins or a distinct hydrologic feature is the local hydroregion. Called "cataloging unit" by the USGS, they have about 2100 of these areas and use them in acquiring and cataloging water data. In an effort not to create new layers of government, there should be an effort to use the MPOs or COGs in creating the local institution. One might need to adjust the boundaries of the MPOs or COGs to coincide with watershed boundaries. At this local level or MPO/COG/hydroregion is where the major planning and implementation of the strategies (including site-specific Best Management Practices) would occur.

Each watershed level river basin would have a citizen committee to guide the work and recommend policies. The committee would be made up of 20 percent industry representatives (including agricultural industry and agriculture), 20 percent environmentalists, 15 percent from the professional organizations, 15 percent academics, and 10 percent representing local governments, 10 percent from state government, and 10 percent from federal agencies. The actual size of the committee would depend on the size of the watershed and population of the area. The group would work by consensus and plenty of time to work through the issues would be allowed in building the plan. The membership of the MPO/COG/hydroregion citizen committee would be appointed by the MPO/COGs. The citizen committees for the unit and planning subregion would be made up of representatives from the MPO/COG/hydroregion citizen committee. The citizen committee for the riverine basin would be appointed by the governors of the states involved.

The local MPO/COG/hydroregion plan would be sent to the accounting unit group. That unit citizen committee would work to integrate the different plans coming from the local MPO/COG/hydroregion committees in their area. The unit citizen committee would negotiate with the local MPO/COG/hydroregion committees as well as among themselves to set consistent strategies to handle the identified problems and priorities for funding. The Unit plan would then be sent to the planning subregion citizen committee for similar action. Their plans would go to the riverine basin citizen committee for integration with the other planning subregion plans. The riverine citizen committee would negotiate with the planning subregion committees, as well as among themselves, to set consistent strategies to handle the identified problems and set priorities for funding. They would set the general policies and water quality standards that must be met for the entire riverine basin. The river basin plan must be approved by the U.S. Environmental Protection Agency.

Based on approved plans and priorities, budgets would be set and funding allocated for implementing the plans.

III. The Watershed Plan

The goal of each local MPO/COG/hydroregion, accounting unit, planning subregion and riverine watershed plan is to protect the physical, chemical and biological

integrity of the hydrologic system and to have all the waters of their watershed in fishable and swimmable condition.

A plan at the local MPO/COG/hydroregion must contain an inventory of the ecosystem, hydrologic system (lakes, ponds, springs, aquifers, streams, rivers, wetlands—tidal and non-tidal—and estuaries). Appropriate and defensible water quality standards will need to be developed based on the best scientific information available. The following topics need to be analyzed and strategies developed to overcome problems as defined in the plan:

- quality of surface and ground water
- quantity of surface and ground water
- assimilative capacity of streams and rivers in the area
- wastewater treatment facilities
- instream flow
- quality of drinking water
- flooding and floodplain management
- erosion and sedimentation
- reuse of treated effluent
- septic tank regulations
- dredging and dredged material disposal
- wetlands
- quality of bay, estuary and coastal waters
- drainage
- stormwater management
- urban and rural runoff, including agricultural and animal waste
- comprehensive plans, zoning ordinances, and subdivision regulations
- transportation plans
- injection and dry wells

The plan also needs to deal with water demand from the following sectors:

- domestic and commercial
- manufacturing
- energy production
- mineral production and mining
- agriculture and ranching
- recreation
- navigation
- fish and wildlife
- natural areas, historic and wilderness areas

The plan must include an implementation plan which will put in place procedures to ensure that local governments are following the practices outlined in an approved plan and that violators be prosecuted. Incentives for local implementation may also be beneficial.

The plan also needs to develop monitoring criteria that will assess the effectiveness of the strategies (including site-specific BMPs) adopted to resolve the problems. The plan must mandate consistency of city/county comprehensive or master plans, zoning ordinances, subdivision regulations and riparian/wetlands regulations within the MPO/COG/hydroregion boundaries—and therefore within the watershed.

The plan should be updated every five years.

Public workshops, education and hearings must be part of the planning process. Only through extensive public education and involvement, so that the consequences of everyone's individual and collective actions are understood, will there be progress in cleaning up our water resources and the environment in general.

There needs to be an appeal process from whatever regulatory measures are put in place. The appeal process should consist first of a hearing by a citizen board. If that does not result in satisfactory resolution of the dispute, then either party can request alternative dispute resolution—the use of environmental mediation. If the mediation is unsuccessful, the use of the courts is appropriate. Legal proceedings should be disallowed until the first two steps have been completed.

STATEMENT OF CALIFORNIA ASSOCIATION OF SANITATION AGENCIES

Mr. Chairman and Members of the Subcommittee, I am Robert Miele, Director of Technical Services at the County Sanitation Districts of Los Angeles County, which provides wastewater treatment services to more than 4.8 million people in 79 cities and the county of Los Angeles. I am here today representing the California Association of Sanitation Agencies (CASA).

CASA is a statewide association of 90 wastewater treatment agencies that collectively serve more than 15 million people throughout the State of California, over half the sewered population in the State.

Since 1972, when Congress passed the Clean Water Act, and most recently the Federal Water Pollution Control Act of 1987, CASA agencies have endeavored to work with EPA and the State of California to implement the requirements of this law. Thus, we are pleased to have the opportunity to present our experience to this Subcommittee and recommend revisions to our nation's present clean water program that we believe will promote sound water quality protection policies into the next century.

CASA believes a number of clean water policy issues are ripe for the Subcommittee's review and revision, many of which are addressed in S. 1114. The focus of this testimony will be on CASA's perspective on the need for a comprehensive Watershed Management approach to water quality protection, and our comments on Section 302 of S. 1114.

The California Perspective

For years, California has been among the leaders in clean water policy development and implementation. CASA is proud of the role that its member agencies have played in providing clean water throughout the state. Recently, however, we have observed the implementation of a clean water policy that is misdirected and unrelated to the available resources. Therefore, for the past several years CASA has been promoting the adoption of a new paradigm for water quality protection: a Watershed Management approach. I am attaching to my testimony (Attachment A) a report entitled "Watershed Management Approach to Toxicity Control," which was prepared in 1992 by Tri-TAC, a statewide technical advisory organization composed of representatives of CASA, the League of California Cities, and the California Water Pollution Control Association. TriTAC's report provides a vivid case study of the Sacramento River, indicating that the major point source discharger to the Sacramento River, the city's POTW, contributes a very small percentage of the metals to the river and yet, under current law may be forced to spend an enormous amount of money to remove these metals with little attendant water quality improvement. The report illustrates the need for a Watershed Management approach and provides an overview of Tri-TAC's ideas regarding how Watershed Management could be implemented. CASA believes that the Watershed Management approach embodied in S. 1114, while somewhat different from that outlined in this report, represents a strong step toward a nationwide commitment to Watershed Management. We are encouraged to see that the debate centers on how, not whether, to design a reasonable Watershed Management policy.

In addition, over the past year, CASA has developed a state-level legislative proposal to implement Watershed Management within California (Attachment B). This proposal is premised on a strong directive from the federal government to the states to approach Watershed Management programs with the same commitment that has been brought to existing Clean Water Act programs. This is vital. Unfortunately, CASA has witnessed inertia on the part of some state and regional regulatory officials who prefer existing programs with which they are familiar (and therefore comfortable) over innovative and cost-efficient water quality programs that would address all sources of water pollution. Therefore, a strong and clear commitment to address water quality through Watershed Management must emerge from renewal of the Clean Water Act. Without this, we are concerned that present regulatory practices will hamstring any meaningful effort to implement Watershed Management programs.

A New Paradigm for Water Quality Protection: The Watershed Management Approach

Enhancement of water quality and water resources to meet national goals through the end of the decade requires a policy and programs that differ from those of past decades. CASA believes a national approach that directs states to implement innovative solutions to site-specific water quality problems is needed, and that such an approach must provide the umbrella for all existing point and nonpoint source water quality programs into the next century. To this end, CASA suggests that S. 1114 be modified to explicitly incorporate other point and nonpoint source programs into the Watershed Management framework. CASA believes Watershed Management is the preferred alternative for several reasons:

- It will permit water pollution threats to be considered on a regional basis instead of on the basis of political jurisdictions.

- It offers the opportunity for all affected parties to work in a cooperative manner to identify water quality priorities and develop appropriate, cost effective strategies for meeting water quality goals within a watershed.
- It offers the chance to target resources toward the real environmental threats. Rather than mandating that all point source dischargers simply meet numeric standards regardless of the impact (or lack thereof) of point source dischargers on a water body, CASA believes that the Clean Water Act should require states to adopt innovative water quality-based permit requirements on a watershed basis that recognize the multi-source nature of pollution (point, nonpoint and atmospheric) and the cross-media impacts that may result from controls. Section 302 of S. 1114 provides an excellent start toward accomplishing that objective. CASA has the following specific comments on Section 302:

1) The Importance of Incentives

While CASA believes that it is imperative for a Watershed Management approach to be adopted on a national basis, we understand the need for different regions and states to have flexibility in how they approach water quality protection. Therefore, we endorse the use of incentives such as those included in S. 1114 to encourage the widespread adoption of a Watershed Management approach.

The choice of an administrative mechanism to develop, implement and evaluate Watershed Management Plans is one of the keys to ensuring timely implementation while minimizing the lag time inherent in any new policy endeavor. CASA supports the use of existing state organizations as the Watershed Management entity. California has regional water quality boards and a Statewide water resources control board. During these times of limited public resources, CASA believes that existing management systems should be used whenever possible to stretch the public's tax dollar. At the same time, we recognize that some states may not have a similar management structure that will lend itself to planning and implementing a Watershed Management program. Therefore, we believe that it is important to provide a state with the latitude, as S. 1114 does, to design its own administrative mechanisms and procedures and to designate the entity that would implement the watershed program.

In addition, we believe it is appropriate to make additional funding available under the State Revolving Loan program to assist in the implementation of Watershed Management for those states that choose to develop Watershed Management Plans. In these times of fiscal distress at the state and local levels, we regard it as essential that states be able to use State Revolving Loan funds to carry out Watershed Planning activities.

The basis of any successful Watershed Management program will rest on how a state defines the watershed and the sources of pollutant loadings within it. In California, we are fortunate that our watersheds are almost completely confined within our borders. This makes the task of designating watersheds and outstanding national resource waters much easier. However, CASA recommends that you consider modifying S. 1114's designation provisions to require EPA and a state to act within a specified time on a resubmitted watershed designation. This will ensure timely progress in Watershed Planning.

2) The Need for Sound Science to Ensure the Protection of Water Quality and the Appropriate Allocation of Resources

The requirements for comprehensive monitoring and assessment contained in S. 1114 are imperative to ensure that an adequate database is available to develop effective Watershed Management Plans. The database provided by such a monitoring program should be designed to identify the real threats to water quality, which often have remained unaddressed under the existing "command and control" regulatory regime of water quality protection and maintenance.

In general, CASA believes that water quality standards should be based on empirical, site-specific studies and monitoring to guarantee that water pollution mandates are relevant and provide a reasonable benefit for the costs incurred. During these times of limited public and private resources, we need to correct the current wasteful "command and control" approach that provides a false sense of environmental improvement at great cost to the public.

Ongoing efforts to address toxics in the San Francisco Bay area provide a good example of how the existing "command and control" approach fails the public's need to obtain necessary environmental improvements at the least overall cost. Since 1960, San Francisco Bay Area POTWs have spent more than \$3 billion to upgrade wastewater treatment systems. These improvements have resulted in 95% removal of conventional pollutants. Pretreatment programs and local limits have fur-

ther reduced toxic discharges. Today, POTWs and industrial dischargers contribute less than 15% of the total metals discharged to the Bay. In fact, our State Water Resources Control Board estimates that POTWs and other point sources contribute less than 3% of the entire pollutant loadings to the Bay. Despite these small loadings, the City of Palo Alto will need to spend more than \$100 million to build lime treatment and reverse osmosis facilities to remove metals in its 23 million gallon per day (MGD) wastewater treatment plant to meet State water quality standards. Annual operating costs for these facilities are estimated at \$21 million. This tremendous capital investment would result in an annual reduction of just 202 pounds of copper in the plant's wastewater discharge. Looked at another way, this represents a 0.02% reduction in the 1.2 million pounds of copper that enter the Bay each year. This situation is not unique to the Bay Area.

Other communities face similar expenditures to meet state water quality plan requirements. For instance, in areas of California and the arid West, such as the Los Angeles area where my agency is located, POTWs will be required to incorporate very costly technologies to treat wastewater discharged into water bodies composed wholly or substantially of wastewater effluent. Applying nationwide or statewide water quality standards to these effluent-dependent streams will result in tremendous public expenditure without a commensurate environmental benefit to the community.

For example, it will cost a single POTW discharging into the Santa Ana River in Southern California \$110 million to remove ammonia from its effluent. This additional treatment will result in a 73% increase in the local community's wastewater rates. Curiously, this removal effort is intended to protect the estimated 2,600 adult mosquito fish that are planted for mosquito larvae abatement in the 8 to 10 mile river segment below the dischargers. Keeping in mind that there are no native fish in the river because of the physical limitations of the habitat, the question must be asked: what does this treatment cost mean to the average ratepayer? Simply put, the cost to remove ammonia is estimated at \$37,000 per fish, or about \$19 million per pound of fish. Moreover, there is no requirement for proof that the mosquito fish are even threatened by the current discharge levels before these new requirements are to be imposed. Dischargers are simply required to meet numeric criteria calculate on a national basis irrespective of local species and water quality.

These examples illustrate the substantial costs local communities will incur to meet permit limits derived from EPA's water quality criteria, regardless of the net effect on receiving water quality. A Watershed Management approach, if applied to these situations, could ensure that water quality standards (and effluent limits) are relevant to the watershed.

3) Addressing All Sources Through Watershed Planning

While differences may arise on how best to design a Watershed Management program, most interested parties would agree that it makes no sense to require compliance with numeric standards (or effluent limits in permits) until all pollution sources are addressed in a coherent plan. Under such an approach, a point source would be issued a permit with effluent limitations that recognize the overall benefit of controlling pollutants from all sources. Thus, a POTW could be subject to a limitation that is less stringent than attaining and maintaining an existing water quality standard if a Watershed Management Plan that includes enforceable reductions in pollutant loadings from urban and rural nonpoint sources can ensure that water quality standards will be met. CASA applauds the Committee for including in S. 1114 provisions to allow this approach to be implemented.

It is now widely accepted that the majority of impaired waterbodies are being degraded primarily nonpoint sources. Hence, we suggest that the Subcommittee strengthen S. 1114 by linking by Sections 302, 303, and 304. Watershed Management will work only if *mandatory* controls are imposed nonpoint sources in those watersheds in which designated uses are not being met and nonpoint sources are demonstrated to be a significant source of pollutants.

4) The Need to Coordinate NPDES Permitting and Watershed Management Planning

One of the most important concerns for CASA member agencies has been the sense that we are moving down an immutable path toward the adoption of effluent limitations in NPDES permits that reflect newly adopted water quality standards, regardless of the attainability or environmental relevance of such standards. Hence, we are greatly encouraged to see in S. 1114 the inclusion of provisions that would allow NPDES permit terms to be extended while a watershed plan is being developed. This is the only way we see for permittees to avoid potentially unnecessary

expenditures of public resources, given that antibacksliding provisions under Section 402(o) of the Clean Water Act would prevent changes in permit limits even if a Watershed Planning effort determines that less stringent limits are acceptable. CASA would like to suggest, however, that S. 1114 be modified to ensure that NPDES permit terms will be extended until a Watershed Management Plan has been approved by EPA (or a delegated state). Of course, we would agree that safeguards, such as continuing compliance with existing standards in permits, are necessary so that this would not become a blank check for point sources.

In conclusion, I would like to commend the Subcommittee for its foresight in including a Watershed Management program in S. 1114. CASA looks forward to working with the Subcommittee in the coming weeks as you refine the provisions of S. 1114.

Mr. Chairman, this concludes my testimony. I would be pleased to answer any questions you or your colleagues may have on how to ensure timely adoption and implementation of Watershed Management Plans at the state and local level. Again, CASA appreciates the opportunity you have extended us to participate in this important endeavor.

WRITTEN STATEMENT OF THE CHEMICAL MANUFACTURERS ASSOCIATION

The Chemical Manufacturers Association (CMA) appreciates the opportunity to submit this written statement on S. 1114's proposed amendments to the enforcement provisions of the Clean Water Act. CMA is a nonprofit trade association whose member companies represent more than 90 percent of the productive capacity of basic industrial chemicals in the United States. CMA's members discharge wastewaters to U.S. waters in accordance with National Pollutant Discharge Elimination System (NPDES) permit requirements and to publicly-owned treatment works in accordance with the pretreatment requirements of the Clean Water Act. Therefore, these companies will be directly and significantly affected by modifications to the Act's enforcement provisions.

CMA supports vigorous enforcement of the Clean Water Act's requirements. However, we believe that ample enforcement authority already exists under the present Act. As evidence, EPA reports that enforcement activity overall is on the rise. In fact, there were more civil and criminal penalties assessed during fiscal year 1992 under the Clean Water Act than under any other environmental statute. Citizen suit enforcement also continues to increase. The U.S. Public Interest Research Group (PIRG) recently reported that "existing citizen suit provisions have allowed significant enforcement activity." In light of these findings, we see no need for expanded enforcement authority—either for EPA or for citizen groups.

The bill before this subcommittee, S. 1114, however, would significantly expand this authority. We would like to point out some of our serious concerns with these provisions. Before turning to these specific provisions, however, we would like to address what appears to be motivating these proposed modifications, namely the *perceptions* that significant noncompliance is widespread and that enforcement by EPA and the states is woefully inadequate. *In fact, neither of these perceptions is true.*

First, reports of widespread non-compliance are contradicted by EPA's own assessment, as reported by Senator Graham at the July 14 hearing on nonpoint sources. According to this assessment, 87 percent of industrial and 85 percent of municipal sources are in substantial compliance with CWA permit requirements. Further, in evaluating the extent of non-compliance, it is important to understand how EPA develops technology-based permit limits. EPA calculates daily maximum pollutant limits that it believes can be met 99 percent of the time, and monthly average limits that the Agency believes can be met 95 percent of the time. Thus, violations can be expected to occur 1 percent and 5 percent of the time by the very nature of the method EPA uses to derive the limits. Facilities like chemical plants that have permit limits for many pollutants, therefore, can be expected to have exceedances, even though they may be in compliance with their permit limits more often than predicted by EPA's methodology.

For example, an enforcement action involving over 100 violations during a 5-year period may sound like a lot, but in fact it would mean the company was in compliance with its permit 99.7 percent of the time. This is better than expected by EPA's methodology. Thus, when reports claim that significant numbers of the nation's major facilities reported *some* violation of the Act, what is truly notable is not the percentage of facilities that reported violations, but rather the fact that a greater percentage of the facilities reported no violations at all.

Second, it is important to understand the nature of the analytical tools that facilities must use to measure compliance. Even state-of-the-art, EPA-approved analytical techniques have a wide range of uncertainty associated with them. As a result, many reported violations may not in fact be "true" violations if they are within the range of uncertainty of the analytical method.

These factors underscore the need for prosecutorial discretion by government enforcement authorities, discretion that is not reflected in simple "bean-counting" enforcement reports.

The exercise of enforcement discretion is, of course, not unique to the area of environmental enforcement. For example, even though there are constant reminders of speed limits along the roadways and even though we are all aware that "speed kills," we would all be horrified, and somewhat poorer, if police officers issued tickets automatically to every driver who exceeded 55 miles per hour on the Washington Beltway. After all, even the most careful driver who diligently seeks to comply with posted speed limits, occasionally finds that the speedometer has crept up to 58 or 60 miles per hour before quickly releasing the accelerator and returning to 55. We would all probably agree that the police should not fine such a driver. On the other hand, drivers who routinely drive well in excess of the speed limit should be cited and fined. The same is true for violations of environmental regulations, including the Clean Water Act.

Put simply, not all violations are significant enough to warrant enforcement. The existing Clean Water Act provides sufficient tools for agencies to enforce against facilities when it is warranted, while providing for appropriate prosecutorial discretion in cases where it is not.

We conclude, therefore, Mr. Chairman, that there is no need for the additional enforcement mechanisms proposed in S. 1114, such as field citations or contract bars.

There is also no need for Congress to overturn the Supreme Court and allow citizen suits for wholly past violations. The objective of citizen suits should be to bring facilities into compliance. Authority to seek punitive penalties for wholly past violations properly belongs to governmental officials, who are accountable to the public.

S. 1114's provision authorizing natural resource restoration is also unnecessary. Natural resource restoration can be obtained under other statutory authorities. It is still very much in the developmental stages, however, so its successful implementation is at best speculative. Including this authority in the CWA will only invite costly litigation, for questionable environmental benefit.

There is also no valid reason for changing how the Act treats violations that result from a single operational upset. In particular, violations of pollutant limits that result from a single operational upset should continue to be considered a single violation.

Finally, there is no need to change the existing provision barring subsequent enforcement by citizen groups when a state has brought an administrative enforcement proceeding.

In summary, the proposed enforcement measures in S. 1114 are unnecessary. They are based on false perceptions about the extent of non-compliance and the level of government enforcement activity. Continued improvements in compliance can and will be accomplished through vigorous application of existing enforcement authority by EPA, states, and citizen groups.

WRITTEN STATEMENT OF THE NATIONAL ENVIRONMENTAL DEVELOPMENT ASSOCIATION

INTRODUCTION AND SUMMARY

The National Environmental Development Association's Clean Water Project is pleased to offer its views to the Subcommittee on Clean Water, Fisheries and Wildlife on enforcement issues in the reauthorization of the Clean Water Act. The National Environmental Development Association is a diverse coalition of companies united in the belief that it is possible to have both economic growth and a clean environment.

The NEDA Clean Water Project believes that vigorous law enforcement is essential to the success of the Clean Water Act. Where individuals or companies violate the law they should be prosecuted and punished in proportion to the degree of their offense. Even so, citizens should not be given the right to sue companies for violations that occurred entirely in the past. Such actions are punitive—they do not improve present compliance or deter future violations—and should remain the prerogative of governments. The government should preserve its authority over such ac-

tions to ensure that all societal goals are considered in deciding to pursue any punitive action.

Some have called for Clean Water Act enforcement to be strengthened, and have looked to the New Jersey Clean Water Enforcement Act as a model for such enhanced enforcement. New Jersey's experience, however, is a model of what not to do. The law has created bureaucratic gridlock, discouraged voluntary action, created inequities in enforcement, and eliminated flexibility in the Act—all without improving New Jersey's water quality. The Governor's Economic Summit Committee on Government Regulations reported to Governor Florio, "While the program (Clean Water Enforcement Act) is recognized to be potentially disastrous to many areas of the economy, its impact on improving the environment was known to be negligible by virtually all professionals who reviewed the bill." The law has been counterproductive, and has created barriers to improving the state's water quality. Congress should not repeat New Jersey's mistake.

CITIZEN SUITS

Citizens should not be given the right to sue for violations that occurred in the past. Such authority would eliminate the distinction between citizen and government action to punish past transgressions. Eliminating that distinction carries a danger in that individual citizens are not bound by the government's need to pursue many public policy objectives. Citizens may ignore their effect on other societal objectives in the single-minded pursuit of one goal, and without the government's constraint of public accountability.

Such actions are entirely punitive—they do not improve present compliance or deter future violations—and are the prerogative of governments. The government should preserve its authority over such actions to ensure that all societal goals are considered in deciding to pursue any punitive action.

Moreover, natural resource damages should not be made a part of CWA enforcement. Environmental remediation is already a part of other laws. CWA enforcement should contain penalties appropriate to the degree of any violation and should be sufficient to be a deterrent to future violations. The separation between improvement projects and fines should continue to be maintained.

ENFORCEMENT—THE NEW JERSEY EXPERIENCE

Recent attention has focused on the New Jersey Clean Water Enforcement Act (CWEA) as a model for the country, and suggestions have been made that elements of the CWEA should be incorporated into the Clean Water Act during its reauthorization. New Jersey's experience, however, shows that the CWEA is bad public policy. It is expensive. It is inefficient. It is inequitable. It discourages voluntary environmental protection, and it does not improve water quality. It is a model of what not to do, and should not be followed at the federal level.

New Jersey Water Pollution Control Program Is Unmanageable

The design and operation of New Jersey's water pollution control program, the New Jersey Pollution Discharge Elimination System program (NJPDDES), is disastrous. It has the highest fees in the nation, and the longest backlog for issuing permits. The CWEA has substantially and materially added to the bureaucratic quagmire in the program's management. While the program has many critics, in the private sector and in local government, the strongest voices come from within the New Jersey Department of Environmental protection and Energy (NJDEPE). The water program was recently described by the chief policy planner for the NJDEPE as almost unmanageable.¹ NJDEPE Commissioner Scott Weiner said on January 8, 1993: "We are all too aware that the NJPDDES program has been plagued with administrative and technical problems. As a result, few new permits have been issued and many facilities are operating under expired permits with outdated requirements. Without public support and confidence in a regulatory program the state cannot meet its obligations to protect the environment and natural resources."²

CWEA Is Part Of The Problem Not Part Of The Solution

Since the CWEA was first proposed in 1988, New Jersey has lost over 100,000 manufacturing jobs, and some of the remaining facilities have had to pay millions of dollars in penalties. This inflexible regulatory system has not produced a measurable improvement in the quality of New Jersey's waters. This result confirms the original analysis by the staff of the NJDEPE that the program would have a severe economic cost and little environmental benefit. Administrative and legal backlogs have paralyzed the system at every stage. The bureaucratic nightmare projected during the legislative debate has arrived.

In analyzing the law, however, one must ask what the CWEA has really accomplished.

First, as the examples described below will demonstrate, the law cannot discourage non-compliance if the causes of non-compliance are beyond the control of a permittee.

Second, the CWEA has taught industry that it is absolutely necessary to exercise all legal challenges to permits issued and to object to any permit condition which may not be fully attainable. Although this is less than an optimal approach, such legal challenges are a clear result of the CWEA.

Third, companies clearly recognize that they must meet their permit limitations and extraordinary efforts (often without clear environmental benefit) are being made to remain in compliance with permit terms.

Finally, an impact of the CWEA which is very difficult, if not impossible, to measure is the number of companies which are factoring the requirements of the CWEA into their decisions for locating new facilities in the State of New Jersey. To the extent such considerations are carefully evaluated, there likely have been disruptions to business growth in New Jersey.

A Level Playing Yield

Some believe that a National Clean Water Enforcement Act would level the playing field for New Jersey companies and municipalities. Imposing these conditions on the entire nation, however, won't help remaining New Jersey businesses; it would only hurt the rest of the nation. New Jersey with local officials, employers, union workers and the State officials who administer this program overwhelmingly condemn it. CWEA creates regulatory gridlock that has placed every NJPDES permit holder in a depressing pit. To place the rest of the nation in the same pit may level the playing field, but at what cost in terms of jobs, competitiveness, output, and living standards; and for what benefit to the environment?

A Model For What Not To Do

Regulatory policy should be perceived as effective, efficient and consistent by the public and the regulated community. For an environmental policy to be judged effective it must be demonstrated that environmental goals are achieved in the most cost effective manner. The CWEA has failed these test in New Jersey.

Case studies will demonstrate the problems that have been generated by this program. Company names are not used because problems are not unique, but are representative of problems with provisions of the New Jersey law. CWEA is a public policy that has punished many companies and municipal entities that were making a good-faith effort to meet their water permit requirements by imposing an automatic enforcement system complete with unjust mandatory fines, and the threat of criminal prosecution and jail sentences.

Serious Violator: Is This A Meaningful Measurement

CWEA, along with federal enforcement, uses the simplistic proposal for defining a significant violator as a person who exceeded an individual permit parameter limit by 20%. This is an unscientific measurement that is unrelated to public health or environmental harm. It contradicts the fundamental nature of water pollution control systems, and fails to recognize the sampling inaccuracies of the existing permit system. The scientific literature demonstrates that a 20% exceedance of a single sample for parts per billion measurements can be within the variability of the testing methodology.³ Many agencies and businesses take these costly samples once per reporting period. Increasing the required number of reporting periods increases the chance for statistical variance.

Mandatory Penalties Imply A Level Of Engineering Perfection

A National Clean Water Enforcement Act would result in a regulatory overhaul that would take professional discretion out of the hands of the EPA and state environmental officials and replace it with an inflexible regulatory system. Such a proposal ignores the realities of a permitting system, has little or no relation to actual environmental harm or cause for such harm, and could actually cause environmental harm as it forces companies to try to renegotiate permits to higher levels. In New Jersey, the State does not have the discretion to distinguish between the true violations and the "false positives" inherent in any scientific monitoring system, and companies have been forced to take a harder line in negotiating for permit limits to build in a comfortable "margin of error."

CWEA Program Assessment

Industry, local government officials, and state enforcement personnel provide universal criticism of CWEA at environmental forums and in written reports. In 1991, a special working group on Governmental Regulations told Governor Florio.

"While the program (Clean Water Enforcement Act) is recognized to be potentially disastrous to many areas of the economy, its impact on improving the environment was known to be negligible by virtually all professionals who reviewed the bill. Despite overwhelming data in opposition to the legislation, substantive comments were ignored by the Administration and the bill was passed purely for political reasons. This was a special piece of law designed for the political benefit of one group at the expense of most of the taxpayers."⁴

A blue ribbon committee that examined the operational problems of the NJPDES program stated in their report to the NJDEPE Commissioner that the mandatory actions and penalties in the Act should be reviewed and modified to improve both their cost and resource effectiveness and to remove barriers for the enhancement of water quality.⁵

The task force went on to state, "In the three years that have passed since the Act's implementation, it has become evident that numerous items in the Act are counterproductive and create barriers to improving the State's water quality."

In particular, provisions of the Act:

- Delay actions that can achieve improvements in water quality;
- Divert both industrial and Departmental resources toward administrative and legal issues and away from activities designed to solve problems to enhance water quality;
- Require duplicative reporting;
- Remove needed Departmental discretion which forces adjudication because of fear of mandatory penalties even with non-achievable permit limits or no environmental impact or benefit. Permittees are forced to litigate permit conditions and limits up front, with accompanying high consultant and adjudicatory costs. Public and private moneys are required for these adjudicatory costs instead of being expended on upgrading facilities to improve water quality;
- Mandate the Department to pursue penalties for violations of permit limits that it considers incorrect but has not yet corrected;
- Preclude the use of a common sense approach to solve problems; and
- Affect all sewer use rate-payers through higher fees due to statutory-required actions.⁶

Inflexible Enforcement

The CWEA adopts a "penalty matrix" enforcement strategy which effectively insulates people in the enforcing agency from site-specific mitigating factors in the enforcement process. At most, a penalty matrix should be used as a guideline. These high levels of fines, however, coupled with an inflexible enforcement process, is one of the main arguments used by those who consider New Jersey a bad place for business.⁷

CITIZEN SUITS: DO WE NEED TO LOOSEN THE REQUIREMENTS (CASE STUDY)

Company A owns and operates a facility in Flemington, New Jersey, which produces zirconium compounds. Company A holds a National Pollution Discharge Elimination System ("NPDES/NJPDES") permit for discharge into surface water.

Company A is presently defending two concurrent lawsuits resulting from its alleged violations of its NPDES/NJPDES permit. The first is an enforcement action by the New Jersey Department of Environmental protection, and the other is a citizen's suit brought by two non-profit corporations, public Interest Research Group of New Jersey Inc. and Friends of the Earth Inc. PIRG and FOE seek to recover substantial civil penalties and costs of litigation, including attorney's fees. The total amount of penalties sought by PIRG and FOE is in excess of \$5 million.

Company A produced evidence to prove that PIRG and FOE could not and did not suffer any injury as a result of its "technical" violations, which were related to unforeseen, uncontrollable, natural, environmental conditions or phenomena, or were measurement anomalies. However, the United States District Court for the District of New Jersey granted plaintiff's summary judgment motion concluding that harm was basically irrelevant in establishing liability, and held Company A liable for civil penalties in an amount to be determined at trial. Company A filed an interlocutory appeal in the Third Circuit affirmed the lower court's opinion despite the fact that

it realized the injury requirements has become a "complete fiction." In oral argument on December 8, 1992, the court stated as follows:

"We did a little bit of research and . . . from published reports, the salt content of the water that was being discharged by this plant is lower than the Sodium contents of some very pricey bottled mineral waters . . .

If that were true, wouldn't that be a fiction that pouring something that is the equivalent of polinaris (sic) drinking water into a Creek in Hunterdon County gives (plaintiff) standing to object to it because he drinks the Trenton drinking water that comes from the Delaware River?"

The consequences of the court's decision to businesses in New Jersey is significant. First, the fact that these types of "technical" violation are subjecting industry, including small companies such as Company A, to the potential of such enormous penalties for discharge violations which have no adverse impact on the environment, is of obvious concern to permit holders across the state. The court's decision makes it possible for groups to subject companies to significant penalties simply because a permit parameter was violated even when no harm resulted. Companies will have to predict permit parameters with absolute certainty in order to avoid liability. This will make the permitting process more difficult and expensive as perfection must be achieved to avoid suits. Furthermore, this policy will discourage the location of any new industries who discharge at all since unpredictable excursions could subject them to massive liability.

Ducks On The Pond

Company A's permit imposes specific discharge limitations upon Company A for various parameters including total organic carbon (TDC), total dissolved solids (TDS), total suspended solids (TSS), sodium, temperature and oil.

Company A's manufacturing process produces no TDC. Instead TDC excursions were caused by geese inhabiting Company A's storage ponds and dropping fecal matter into the water which, in turn, acted as nutrients for algae which resulted in higher levels of TDC. The temperature excursions were a direct result of the sun warming the effluent to the same ambient temperature as the creek which happened to be warmer than predicted in the permit.

Citizens should be concerned about the design and implementation of a public policy that is willing to render environmentally conscious companies liable in the context of these citizen suits for permit violations which do not cause any injury or environmental harm.

It seems evident that if an ultimate appeal to the U.S. Supreme Court fails, Company A will be forced into an out-of-court settlement with the plaintiffs. Legal fees will be paid to the plaintiffs attorney and Company A will fund an environmental project selected, recommended or approved by the plaintiffs. A multi-million dollar settlement would be viewed as a victory for the "environment." The reality is that 100 workers would probably lose their jobs when such a settlement in all likelihood forces this business to close.

Parking Lot—\$60,000 (Case Study)

A mid-sized New Jersey manufacturer, Company B, has been fined close to \$60,000 with the potential more to come, for permit exceedances resulting from stormwater runoff from its parking lots. The permit in question was issued in the early 1980s. The permit was obtained at the time to regulate the discharge from a sewage treatment process on the site which is now long gone. Per DEPE's instructions, all stormwater runoff points were also included in this permit. The parameters for stormwater discharge were established in the absence of sufficient data since EPA was conducting a nationwide stormwater study and nothing was concluded at the time.

When regular monitoring of the stormwater was undertaken, it became clear that the quality of stormwater runoff was affected by salt, sand, dirt, vegetation, pollen, acid rain, and other environmental factors, many beyond the control of the facility. Since the limitations were set in the absence of data, the company has had major difficulties in meeting the permit limits in terms of particulates and pH.

Extensive discussions with DEPE aimed at revising their permit yielded no result. DEPE officials cited the "anti-backsliding" provisions of the federal Clean Water Act, which aims to prevent real polluters from cutting unfair deals.

This facility's otherwise sterling record in environmental control has counted for nothing with DEPE. They are paying the sort of enormous fines that only malicious polluters should pay. In addition, they are incurring sizable legal costs to deal with the administrative process associated with their case.

NJPDES Parking Lot—\$1 Million (Case Study)

Company C, a paint pigment manufacturer, applied for a non-contact cooling water discharge permit application in 1977. The original plans (to discharge non-contact cooling water) that necessitated the application for a NJPDES permit were never implemented. Nonetheless, the facility received a NJPDES permit which they never carefully scrutinized. As a result, the only discharge which became regulated was for stormwater from the facility parking lot. Now, with the adoption of the CWEA, the rules with regard to NJPDES permits and penalty imposition for non-compliance with NJPDES permits have changed.

Company C can document that off-site sources contribute significantly to the contaminants monitored. In fact, stormwater has been monitored before it reaches the facility and high levels of the pollutants regulated by the company's NJPDES permit have been observed. Unregulated neighboring facilities and the contaminants in stormwater flowing onto the facility from city streets are contributing to the effluent monitored pursuant to the company's NJPDES permit. A single facility should not be held responsible for runoff from unregulated neighboring facilities. Nonetheless, this is precisely what is required by the company's existing permit effluent limitations. Clearly, no single company can foresee or control what occurs off-site. As a result of the off-site impact and the severe penalty actions initiated by the NJDEPE, the company has gone to great lengths to reduce the possibility that stormwater is impacted by its facility. To the extent it has control over stormwater discharge, the company has, over the years, undertaken substantial efforts to comply. To do so, the company has had in place a Best Management practices (BMPs) program. In light of the severe penalties imposed pursuant to the CWEA, however, the company was forced to develop an Extraordinary Management Practices plan making even more substantial improvements to reduce the presence of contaminants in stormwater runoff.

The efforts to reduce contaminants levels in stormwater runoff has involved the expenditure of more than \$1 million. Perhaps the most important actions taken by the company to maintain permit compliance were the purchase of an employee parking lot across the street and the absolute prohibition of employee parking on the NJPDES regulated parking lot. Additionally, the company has purchased machinery to mechanically sweep their regulated parking lot. Until prospective relief with regard to its NJPDES permit is obtained, the company faces continued penalty exposure for circumstances clearly beyond its control. In sum, application of the CWEA to this particular facility provides no environmental benefit and demonstrates that the New Jersey regulatory scheme yields perverse results.

Environmental Volunteer—\$154,500 (Case Study)

Company D's case involves a company (a commercial truck stop) that was penalized severely because of voluntary efforts to act in an environmentally responsible manner. The NJPDES permit for this particular company was issued as a result of its entirely voluntary decision to install an oil-water separator. In an attempt to operate as a good corporate citizen, and in the interest of maintaining a clean, contamination-free facility, the oil/water separator was installed. There are no rules and regulations in effect now or at the time that the oil/water separator was installed that would have required the company to purchase and operate this device. Moreover, the company was not compelled in any way to place or operate the oil/water separator. Nevertheless, the company opted for this approach. This wholly voluntary effort to act in environmentally responsible manner required the company to obtain an NJPDES permit. As a result of this permit and exceedances of certain parameters set forth in it, an enforcement action and severe penalties (\$278,500) were assessed (penalties were settled for \$154,500).

If this company had not voluntarily chosen to install the oil/water separator, an NJPDES permit would not have been issued and penalties would not have been assessed. By putting the oil/water separator into place, this company stands out among the truck stops located in its general vicinity. Indeed, this particular truck stop is one of the cleanest and most well maintained in the state. Nevertheless, severe penalties were levied because of its efforts to be environmentally responsible.

Since imposition of the penalty assessment, this particular company has gone a step further and installed a new oil/water separator which is larger and more efficient than the separator previously used. Thus, not only did this company act initially as a good corporate citizen, but it has continued to act in that fashion despite the punitive nature of the penalties which were imposed by the NJDEPE.

These cases are poignant examples of the negative impact of the CWEA. This list of case studies could continue where the CWEA clearly provides no improvement in water quality and does nothing more than exhaust the resources of New Jersey

businesses. Most such cases involve NJPDES permits which were issued for stormwater from facilities. Such permits generally impose numerical effluent limitations which merely monitor non-hazardous pollutants at the end of a pipe, and do not prevent pollutants from entering the waters of the state. It is our understanding that the effluent limitations established in many NJPDES permits were based on a United States Environmental Protection Agency Region II policy memorandum dated in 1978 regarding surface water and cooling water discharges. To our knowledge, no scientific data supports the effluent limitations continued in that memorandum. Nevertheless, the guidance was used by New Jersey to establish many permit numerical effluent limitations. Additionally, existing permits with numerical effluent limitations fail to consider the relationship between the cost of attaining a reduction in contaminant levels and the environmental benefit of the effluent reduction.

Effluent measured by many NJPDES permittees is comprised largely of and is greatly impacted by contaminants emanating from off-site sources. It is clearly unfair to hold permittees responsible for runoff from unregulated, adjacent facilities which happen to drain through their facilities.

Five Days Late—No Pollution But A \$12,000 Fine (Case Study)

Representatives of Company E, a manufacturing facility in West Trenton, were appalled to learn that they faced a potential fine of \$12,000 for the late submittal of a routine form related to a quarterly sampling report for stormwater on their property. According to the company, they submitted the report five days late and it did not contain any permit exceedance. The reporting form was misplaced by a clerical employee of the company. The firm has been submitting this form on time and without permit exceedance since 1985. A departmental employee informed the company that the penalty for late submittal could be reduced by up to 50 percent. That would be a \$6,000 fine for less than a week delay in filing a report that today wouldn't even have to be filed if the company was covered by the new general permit for stormwater.

The company representatives were, not surprisingly, upset about the draconian nature of this penalty. When they sought the assistance of the NJDEPE in reducing this penalty to a level that would be compatible with the degree and nature of the offense, they were told that the state did not have any discretion in this matter and that the actual penalty would be \$12,000. This case is symptomatic of an enforcement policy that appears unfair and out of line with a public policy that would have the penalty commensurate with the crime.

Conclusion

CWEA has not helped maintain and restore the chemical, physical, biological integrity of New Jersey waters. It has instead hindered the State's efforts to improve its water quality while creating an unfair and unworkable administrative structure. Congress should not use New Jersey's law as a model for the enforcement of the Clean Water Act.

STATEMENT BY TUDOR T. DAVIS, ACTING DEPUTY ASSISTANT ADMINISTRATOR, OFFICE OF WATER, ENVIRONMENTAL PROTECTION AGENCY

INTRODUCTION

We address today a subject of great importance—the critical need to protect our watersheds in a comprehensive, integrated manner that expands our focus beyond source-specific chemical pollution to one that addresses aquatic ecosystems in their entirety. The United States Environmental Protection Agency (EPA) believes that a watershed approach represents one of the best vehicles by which we can restore and maintain the physical and biological, as well as chemical, integrity of our Nation's waters.

Since 1972, we have achieved considerable success in substantially reducing the discharge of pollutants into our lakes, rivers, estuaries, wetlands and coastal waters. These successes have been achieved primarily through the control of point sources of pollution. While point source discharges continue to present an environmental threat in some areas, we have come to recognize that the health of our Nation's waters is endangered by many other activities that are not associated with point sources. Evidence of these problems can be seen in the decline of the salmon populations in the Pacific Northwest and the oyster stock in the Chesapeake Bay, in ongoing contaminated fish problems in the Great Lakes, in the declining health of the Everglades and the coral reef systems in Southern Florida, and in numerous other small and large watersheds across the country. We discussed the causes and effects of polluted runoff and other forms of nonpoint pollution in our testimony on July 14, 1993. My statement today will elaborate on the themes expressed in that testimony, and will discuss in greater detail an approach that focuses on the watershed as a whole, that addresses comprehensively all of the actual and potential sources of impairment of a waterbody, and that integrates many diverse programs to achieve fully the goals of the Act.

I would also like to discuss four important ecosystem protection programs that illustrate application of watershed principles. Three great waterbody programs deal with ecosystems that are very large in scale and that cross the boundaries of many States: the Great Lakes Program, the Chesapeake Bay Program and the Gulf Mexico Program. One additional program, the National Estuary Program (NEP), is a similar ecosystem protection approach that works on a smaller scale to protect water resources. Like the great waterbody programs, the NEP provides examples of State and local representatives cooperating to identify water quality problems in their shared water resources and to implement solutions. Each of these four programs also places considerable emphasis on protecting habitat and guarding the water resource against impacts to its chemical, biological and physical integrity. Today, I would like to explain how these four ecosystem protection programs fit into the watershed approach that the Agency advocates. And, finally, this statement will offer EPA's comments on a number of bills currently proposed to address problems within these important ecosystems.

OVERVIEW

The potential causes of impairment of a waterbody are as varied as human activity itself. For example, the health of an aquatic ecosystem may be threatened by discharges from industrial or municipal sources, from urban, agricultural or other forms of polluted runoff, from land disturbance activities and hydromodification, discharge of contaminated ground water to surface water, from overharvesting of fish and other organisms, from the introduction of exotic species, and even from deposition of pollutants originally emitted into the atmosphere. Many of these activities are addressed by programs under the Clean Water Act (CWA) or a variety of other federal laws that provide mechanisms to protect, restore and enhance our water resources.

Unfortunately, efforts under these programs have been largely fragmented and piecemeal. Under the constraints of their statutory authority, each of these programs focuses on particular sources, pollutants, activities or water resource uses and generally do not take a comprehensive, multimedia approach to water-related issues based on hydrologic boundaries. As a result, there are significant gaps in our efforts to protect ecosystems from the cumulative impacts of a multitude of activities that "stress" our waterbodies.

In an effort to address these complex remaining problems in a cost-effective manner, the Administration strongly endorses a "Watershed Management" approach which looks first to the ecosystem itself, evaluates its needs based on risk, a part of the process. We endorse this approach because we believe that tailored, coordinated solutions, to which local constituents are committed, can best be achieved within the boundaries of an identified natural resource or watershed. Our experience repeatedly shows that people are most likely to protect what they know and on which they depend for drinking water, recreation, sustenance or their livelihood. The watershed provides a logical area within which to build on this local commitment, to coordinate private sector, regulatory and voluntary programs, and to develop and implement solutions appropriate to the particular watershed. The watershed also defines an appropriate area in which to conduct monitoring and to provide a basis for employing appropriate economic incentives. In short, we can no longer assume that "national" solutions will, by themselves, solve all local problems, although our national baseline program will continue to provide the necessary foundation on which to protect our water resources on a geographic basis. Indeed, we recognize

that other levels of government and the private sector may have expertise, institutional arrangements or legal authorities more appropriate to addressing problems in these ecosystems than EPA or other federal entities. Finally, by focusing on the most significant problems specific to each watershed, rather than on trying to apply uniform remedies to all watershed, we believe that we can address our remaining resource problems more comprehensively and cost effectively.

We believe, therefore, that amending the Act with Watershed Management as a central organizing principle will help us to realize more fully the objectives of the CWA and to ensure that our valuable aquatic resources and the living resources that depend upon them are protected for our children and for future generations. We commend Senators Baucus and Chafee and their staff for incorporating into S. 1114 a comprehensive watershed program that rewards State watershed efforts and for making Watershed Management a central tenet in this reauthorization effort.

As will be explained in greater detail below, in EPA's view, a successful State Watershed Management program should incorporate certain minimum elements, which should be specified in the statute. First, with the help of U.S. Geological Survey hydrologic maps, the State should delineate the watershed of all water resources within the State. Second, the State should identify its impaired and threatened waters as well as other waters deserving special attention (such as estuaries, drinking water sources, or outstanding national resource waters) when preparing an inventory. Third, the State should ensure that the watershed boundary for each water in the inventory encompasses significant activities that threaten or impair the water resource. Fourth, the State should establish, in order of highest priority, a ranking of each delineated watershed for subsequent management. Finally, the State should convene Watershed Management teams for the highest priority watersheds, which would be charged with ensuring local participation, identifying the significant problems and overseeing implementation of the chosen solution. Ideally, EPA then should have the authority to approve and oversee State Watershed Management programs if the State wishes to take advantage of various incentives available upon approval of a State's Watershed Management program.

We also concur with the recommendations of Water Quality 2000, which among other things advocate incorporating the concept of "nesting" smaller Watershed Planning into the management of large water basins. These recommendations were endorsed by 64 public, private and non-profit organizations. Water Quality 2000 recommends that, where appropriate, Watershed Planning and management institutions should reflect the progression from small, highly localized watersheds to each successively larger watershed, culminating in the large water basin that encompasses them all. Institutions created to manage smaller watersheds should participate in planning and management of the large watersheds to which they belong. Such a nested hierarchy could be organized at the top with an umbrella planning institution for each major watershed. These institutions could include a mechanism to plan for protection of groundwater resources that cross watershed boundaries. In order to promote the planning and managing of large water resources on a regional basis, we believe that Congress should authorize the establishment of umbrella interstate regional mechanisms, including joint federal interstate compacts, at the request of States.

We have identified three opportunities to advance the watershed approach legislatively in the CWA. First, Title I of the Act should be amended to define and endorse the approach, including the concept of establishing interstate regional mechanisms to plan and manage water resources and to accommodate progressive hierarchies of watershed within a particular river, estuary or lake basin. Second, a new provision, not unlike the new CWA § 321 which would be added by section 302 of S. 1114, should be incorporated to reward States that develop State watershed programs. And third, where appropriate, existing provisions in the Act should be modified to facilitate the use of the watershed approach to the greatest extent possible. It should be noted that S. 1114 includes several changes that we believe will enhance our ability to look holistically at ecosystems. Before elaborating on the suggestions mentioned above, it is important that we first highlight EPA's experiences with the watershed approach to date and to touch upon some of the lessons we have learned.

THE ADMINISTRATION'S WATERSHED APPROACH

We believe that the watershed approach should be promoted through comprehensive State programs that would be approved by EPA in consultation with other federal agencies.¹ As a condition for watershed program approval, a State should be

¹ Hereafter the term "States" includes eligible Tribes and Territories.

required by the CWA to identify all watersheds within its borders and to rank those watersheds, from highest to lowest priority, according to the level of protection the State decides to accord to the water resource. This priority ranking or targeting process should involve key federal, State and local stakeholders and should reflect the State's inventory of its impaired, threatened or special waters. In order to facilitate more comprehensive inventories, we support the consolidation of the inventory provisions of Sections 303(d) 305(b) 314(a) and 319(n) into one comprehensive assessment and ranking process.

States should consider a variety of factors when ranking their watersheds. For example, a State should consider conferring priority status on those watersheds in which waterbodies fail to meet water quality standards or are otherwise impaired by loss of biodiversity or habitat, but also those watersheds containing waterbodies that are "threatened" or in need of special protection, such as outstanding natural resources waters or waters with unique or declining aquatic ecosystems. Watershed rankings should reflect the severity or immediacy of the risks to human health as well as uses of the watershed in terms of its economic, recreational and aesthetic importance.

Having defined and ranked its watersheds, a State seeking approval of its watershed program should then be required by statute to develop a management strategy for its watersheds. That strategy would need to include a schedule by which the State commits to address its watersheds as necessary to ensure the attainment of water quality standards and ecological objectives as required by the CWA. Schedules may be influenced by factors other than those considered in initially ranking watersheds. These may include, for example: the cost to achieve the goals; the amount of work necessary to achieve goals; the merits of pollutant reductions to be achieved, including the severity or immediacy of the risks to human health and living resources; the degree of public interest and willingness of stakeholders to proceed; the availability of resources (programmatic, technical and funding); and the likelihood of success.

Watersheds in which no threat, impairment or special need is identified may require little intervention to maintain the water quality of the river or lake it surrounds (although such water quality should be monitored periodically to verify ecosystem health). Other watersheds may need extensive management over time, which may involve many levels of government and other organizations. In order to receive EPA approval, a State Watershed Management program should specify minimum requirements, as set forth in the statute, for the management of these watersheds. For example, the statute should direct the State to establish for these watersheds management entities that would be responsible, at the watershed level, for the comprehensive assessment and management of the particular watershed. In order to ensure local involvement, these Watershed Management entities should be required to consist of stakeholders with an interest in the water resource and its protection-federal, State and local governments and most especially the sources whose activities are perceived to contribute to the problem and the general public who will benefit from the water's restoration. Using the resources and perspectives contributed by its participants, the Watershed Management entities should then be required to identify priority problems, their causes, and potential solutions. In addition, the statute should require each entity to develop expeditiously a management plan that specifies actions and implementation mechanisms to address those problems and that establishes watershed-level goals consistent with the CWA (including State water quality standards and biological, habitat and other physical factors such as flow) and the Safe Drinking Water Act. The statute should also specify that the management entity (or other organization, such as the State) possesses the authorities necessary to implement the plan and that the plan include a process to evaluate the success of the actions taken and revise the watershed plan as appropriate. We also encourage States to enter into agreements with other States, where watersheds cross State boundaries. The CWA could be amended to promote strongly interstate management efforts.

Although EPA should play an important role in facilitating the development of watershed-level management plans, we believe that approval and oversight of local watershed plans should be vested in States with approved statewide watershed programs in place. This will afford greater local flexibility and will prevent what could potentially be an overwhelming administrative burden for the federal government. Moreover, according to this central role to State programs avoids one of the primary problems experienced with the "Areawide Planning" approach in Section 208, which was not well integrated with State water quality programs. Legislation could ensure adequate federal involvement through EPA-published guidance and through EPA approval and oversight of State programs, with significant involvement of other ap-

propriate federal agencies. EPA guidance, published with the assistance from other federal agencies, could assist States in: designating watersheds; setting priorities; analysis and predictive modeling; managing the control of point and nonpoint source pollution to implement the requirements of the Act at least cost; and, promoting the protection of the water resource, including habitat protection and restoration, ecosystem health, species diversity, flood control, recreation and other important interests. Guidance could also help States to identify priority problems within a watershed and to develop monitoring programs to measure environmental changes and reduction of risk as a result of watershed activities. This watershed protection approach closely parallels the Agency's initiative in ground water protection. In May 1991, EPA issued a policy statement, "Protecting the Nation's Ground Water: EPA's Strategy for the 1990s," that promotes the development and implementation of comprehensive State ground water protection programs. Because there is a direct link between surface water and ground water, the watershed approach, coupled with comprehensive ground water protection, will truly address the totality of water resources.

It is also important to emphasize the need to maintain and support a strong research program to provide the scientific bases for these ecosystem and habitat protection efforts. Research on such topics as ecosystem processes and functions; development of ecological criteria, environmental indicators, and ecological risk assessment methods; and monitoring of status and trends is essential to the success of ecosystem and habitat protection.

Incentives

Although we believe that Watershed Planning can be an efficient and hence intrinsically attractive approach to addressing potential or actual threats to water quality, EPA also supports the establishment of incentives to promote the development of comprehensive, well-integrated and cost-effective watershed programs in the States. To be eligible for these incentives, State programs would need to be consistent with certain minimum elements set forth in the statute. Although there is currently significant enthusiasm for the watershed approach, we recognize that a great deal of effort may be required to achieve programmatic changes and to implement a comprehensive approach. For example, State agencies dealing with health, agriculture, fisheries, coastal zone management, land use and other natural resources may need to coordinate and integrate their programs to assist and participate in Watershed Management efforts. EPA supports the creation of incentives to encourage States and local entities to undertake the requisite effort. Incentives should be closely tied to the successful implementation of approved State Watershed Management programs, although we should be wary of developing a system of penalties, because these could actually detract from a State's ability to accomplish this goal. This link between accomplishments and rewards is a critical aspect of using incentives to ensure widespread application of a voluntary watershed approach.

Incentives can take several forms, notably financial and regulatory. As a financial incentive to participate, implementation of Watershed Management action strategies could be funded, if eligible, under grants and other financial assistance currently authorized under the CWA, including Sections 104(b) 106, 314, 319, 320(g) and 604, as well as under other federal statutes. In addition, we would support modifications to the State Revolving Loan Fund (SRF) to provide that projects developed under approved watershed plans and eligible under current law should be accorded priority in SRF funding, and to ensure that SRF projects will not be inconsistent with such plans.

Incentives could also be offered to States and local watershed entities that would improve nonpoint source controls, hasten progress toward water quality objectives and reduce costs. In our testimony to the Subcommittee on nonpoint sources, we endorsed the general approach of S. 1114 towards nonpoint source control, including the application of best available management measures to existing and new sources in impaired and threatened watersheds and to new sources (although not existing sources) in all other watersheds. We proposed that in lieu of these national management measures, however, States could defer to strong and broad State watershed programs that would expeditiously address the stresses in the highest priority areas. In order to qualify for this exemption, a State management program would need to include local, tailored nonpoint source management measures for significant pollutants, demonstrate that the nonpoint source controls in combination with point source controls would achieve and maintain water quality standards within twelve and a half years, and ensure that the nonpoint source controls are backed by necessary implementation mechanisms and enforcement authorities.

Regulatory incentives also may be available for point source control. For example, a State with an approved watershed program (that administers the NPDES program) could be authorized to issue a one-time, five-year extension in its NPDES permit terms in order to enable the State to address all permits within a watershed simultaneously, and thereby to coordinate permit limits so as to achieve water quality standards in the most efficient and equitable manner possible. Additionally, in those watersheds where the Watershed Management Plan provides for the attainment of water quality standards, watershed programs could encourage the greater use of trading (for other market mechanisms already authorized by law) to meet water quality standards. Furthermore, States could be granted additional time, perhaps four years, to adopt biological, ecological, and physical criteria as environmental indicators that would be consistent with their watershed programs.

States wishing to employ a watershed approach also could be eligible for regulatory streamlining of the CWA's assessment, inventory and targeting requirements. For example, we believe that watershed plans could be allowed to fulfill, or at a minimum, be coordinated with inventory, ranking, planning and reporting requirements under Sections 303(d), 303(e), 305(b), and 319 and other federal or State programs such as State Wetland Conservation Plans, USDA River Basin Plans, and CZARA programs, provided that the State watershed program meets the particular requirements of these respective programs. A consolidated and expanded priority listing system, which examines other non-chemical factors such as habitat loss and degradation, is critical for the establishment of a credible process by which States decide where to begin work in their watersheds.

In addition, a Watershed Management entity could be granted high priority to receive federal financial and technical assistance for activities such as wetlands advance identification, general permits, or mitigation banking under Section 404. Approved watershed programs or plans that have implemented wetlands advance identification with the support of EPA and the Army Corps of Engineers or have developed wetlands components that are generally at least as environmentally protective and meet other established criteria should be given general deference for Section 404 programmatic permits rather than individual permits. (Programmatic permits are issued by the Army Corps of Engineers). The Agency looks forward to discussing these and other wetlands matters with you more fully at this Subcommittee's future hearings.

Another regulatory incentive could be offered with regard to Safe Drinking Water Act (SDWA) requirements. Watershed Management entities, including public water supply systems, in primary States with approved watershed programs and source water programs (under the SDWA) could be allowed to tailor prevention, monitoring and treatment alternatives, provided that the alternatives satisfy source water protection conditions. Components to be addressed include: delineation of drinking water protection areas, contamination source inventories, vulnerability assessments, public education, source controls, enforceable policies and mechanisms, ongoing surveillance, and program updates.

It is very important to note that application of the watershed approach does not imply any retreat from current pollution control requirements. For example, existing national secondary treatment standards for municipal waste water treatment facilities, Best Available Technology and Best Conventional Technology for industrial facilities, and nonpoint source controls would remain in effect, and the focus of Watershed Management would be on reducing those stressors not addressed by EPA's "traditional" water quality programs. It is also important to emphasize that we must continue to maintain and support a strong research program to provide the scientific basis for the watershed approach. Research on such topics as ecosystem processes and functions, development of ecosystem criteria, environmental indicators, monitoring of status and trends, and landscape characterization is essential to the success of the watershed approach.

We commend S. 1114's use of funding, regulatory incentives, and relief from certain administrative burdens to reward States and local entities that undertake watershed programs on a volunteer basis. In addition, we applaud the bill's efforts to facilitate the use of trading. We believe that this voluntary approach to Watershed Management with its emphasis on financial and regulatory incentives, rather than penalties¹ is the appropriate means to promote Watershed Management, while sustaining the enthusiasm and commitment that the approach is generating.

Current Watershed Efforts

Recently, we have joined States in experimenting with watershed protection programs. EPA is working with the Association of State and Interstate Water Pollution Control Administrators to provide technical and financial assistance to accelerate

efforts by several States to adopt State-wide Watershed Management. In its pilot project, for example, the State of Washington is seeking to make the transition to a "basin approach" that will involve synchronizing within each basin the issuance of permits for surface and ground water protection, the development of Total Maximum Daily Loads, and the implementation of nonpoint source controls. In a second phase, Washington plans to broaden its focus to include more stakeholders and to integrate coastal zones, wetlands, flood control, and habitat and wildlife protection into basin management.

Although Watershed Management is not a new concept and was the guiding principle behind the River Basin Commissions formed in the 1950s and 1960s, the genesis of our current watershed efforts are several geographically targeted programs. These include: the National Estuary Program, with 21 estuaries identified in the CWA as being of "national significance"; and the Great Lakes, Chesapeake Bay and Gulf of Mexico programs, which are all very large scale, multi-faceted projects. The Great Lakes and Chesapeake Bay programs, in particular, are moving toward a "nesting" approach that incorporates a tributary or small watershed strategy into the larger framework of their programs. Each large water basin, including the Gulf of Mexico and many of the estuaries in the National Estuaries Program, are comprised of numerous smaller watersheds and ecosystems that present Unique problems. Focused management of those smaller systems—through the watershed protection approach we have described—often is necessary to achieve many of the environmental goals of the larger basin to which they belong. At the same time, management of the smaller systems needs to occur within the context of the successively larger systems in the watershed hierarchy. In this way, we believe, the great water-body programs intersect effectively with the locally-based watershed protection approach we also endorse.

THE GREAT LAKES PROGRAM

The Great Lakes represent 18% of the world's surface fresh water and 95% of the surface fresh water found in the United States. The lakes are a well-spring of biological abundance and diversity for all North America as well as a source of abundant fresh water critical to the industrial strengths of the region. The Great Lakes Program was established by Congress in 1972 through inclusion of a pollution control program for the Great Lakes under § 108 of the CWA. The program evolved over time with a focus on State management programs and included an international structure to address transboundary pollution issues in the U.S. and Canada. These international efforts eventually culminated in a U.S./Canada agreement (the Great Lakes Water Quality Agreement of 1978). EPA also works with the International Joint Commission (created by the Boundary Waters treaty of 1909) in addressing environmental degradation concerns that impact the Great Lakes ecosystem.

The Agency's Great Lakes program is a proactive multimedia program to protect and restore the Great Lakes ecosystem. In 1991, EPA, along with other federal agencies, the eight Great Lakes States, and the Chippewa and Ottawa Tribes, developed a joint five year strategy to provide a comprehensive, long-range vision to identify and accomplish environmental goals for the Lakes. The strategy, which established its priorities on a risk basis, emphasizes three long term goals: reducing toxic loadings; protecting and restoring vital habitats; and protecting human health and the health of the ecosystem's living resources. The strategy also targets efforts to priority geographic areas, thereby promoting more localized Watershed Management within the context of the Lakes as a entire system. Most recently, EPA proposed—in close concert with and at the request of the Great Lakes States—Great Lakes Water Quality Guidance that will result in a unified regulatory approach to water quality standards among the Great Lakes States.

Through our work in the Great Lakes basin, EPA has also advanced the understanding of both contaminated bottom sediment problems and promising technology to remedy those problems. In an example of effective Watershed Management, we have increased our knowledge of the sources and fates of PCBs in the Fox River/Green Bay watershed to promote the restoration of that important system. We have also acquired greater expertise in strategic conservation of habitat as a means to protect biological diversity, which, although local in focus, promotes a broader effect within the overall strategy of the Program.

As Congress considers Issues surrounding reauthorization of the CWA, we welcome the clear interest in Great Lakes issues shown by Senator Metzenbaum through his introduction of S. 1183, the "Great Lakes Clean Water Amendments of 1993." We support the bill's endorsement of Watershed Management approaches and applaud those portions of the bill that will aid in the identification and implementation of cost-effective sediment remedial options. We are working to develop

and implement a national sediment management strategy for the Great Lakes and other waterbodies where contaminated sediments contribute to ecosystem impairments.

We also strongly support the protection of the biological integrity and diversity of the Great Lakes ecosystem. While considerable work remains to be done with regard to chemical pollution, we now recognize that those efforts alone will not be adequate to restore and maintain the physical and biological integrity of the Great Lakes ecosystem. Reauthorization of the CWA should build upon the progress being made under the comprehensive multi-media approach we are now pursuing. For example, we believe that a Watershed Management approach, which integrates joint federal, State, Tribal and local action, is necessary if we are to address successfully the many non-chemical stressors on the Great Lakes system, such as physical alteration of the landscape, loss of critical habitat (which is occurring at an accelerating rate), and the introduction of exotic species, such as the zebra mussel. Strengthening the nonpoint source program also will help us to protect the Great Lakes ecosystem. We have the opportunity—and in deed, the responsibility—to protect and restore the biological and physical, as well as chemical, integrity of the Great Lakes ecosystem. Without an integrated watershed approach that addresses the ecological consequences of human activity on the Great Lakes, the Lakes will experience further losses of natural biological diversity and productivity, with concomitant losses in the economic vitality of the region. We are pleased that these principles are reflected in S. 1114.

While we welcome Congressional interest and support of Great Lakes environmental protection, we believe that there are some provisions of S. 1183 that would direct limited resources to issues that may not pose the greatest environmental risk and that in fact could be addressed under existing authorities, such as Section 319 or Section 404 of the CWA. For example, the bill would create a new "permit program" similar, but in addition, to the Section 404 program, which would continue to regulate disposal of dredged material into the open waters and confined disposal areas of the Great Lakes. EPA does not believe that these new provisions are necessary, and that, indeed, they have the potential to divert resources from the evaluation of environmental impacts in order to conduct this newer, less comprehensive review.

In addition, EPA believes the authorizing legislation needs to preserve the flexibility afforded to the Program at the regional and local watershed level to implement integrated approaches to the Lakes' complex environmental problems. For example, one of the most pressing environmental problems in the Great Lakes-contaminated sediments—will require increased flexibility in order to successfully address the issue.

The Agency does not support the use of the State Revolving Fund (SRF) for sediment remediation due to the inherent restrictions of the SRF and the additional burdens that such use would place on the fund, which is already overwhelmed by currently eligible project needs. In addition, we strongly recommend amending Section 118 of the CWA to eliminate unattainable deadlines for Agency actions. Such deadlines unfortunately have the unintended effect of causing EPA to divert scarce resources from the development and implementation of effective programs to the defense of lawsuits. We are also very concerned about the deadlines for Lake wide Management Plans (Lamps) contained in S. 1183. Those deadlines are inconsistent with the management structure of the Lamps, which includes open participatory public process that addresses the issues and interest of all Great Lakes stakeholders.

THE CHESAPEAKE BAY PROGRAM

Congress directed EPA in 1975 to investigate the causes of environmental decline in the Chesapeake Bay. To achieve this goal, EPA established a Chesapeake Bay Program Office that formed partnerships over the years with key Chesapeake Bay States, federal agencies and other interested parties such as citizen groups. After identifying the key ecological health problems of the Bay—such as nutrient over enrichment, loss of Bay grasses and fisheries resources—EPA along with its partners has worked towards collectively *and* effectively reducing these risks. A commitment to action by the States was evident from the beginning of the program. This led to strong management programs for point and nonpoint sources within the States to help restore the health of the Bay.

The Bay Program is an institutional model for a multi-State, ecosystem approach to protecting and restoring a large complex watershed. In addition to achieving significant environmental results, the Program has pioneered advances in science and technology that can be used in other large ecosystems.

In 1987, as part of the Chesapeake Bay Agreement, the Program set a goal to reduce the level of nutrients in the Bay by 40% by the year 2000 and to maintain that level—or lower—thereafter. To date, phosphorus levels in the main stem of the Bay have been reduced by 16% and nitrogen levels stabilized since 1985 although there has been substantial population growth in the basin. In addition, as part of the 1992 amendments to the 1987 agreement, the Program has achieved caps on nutrient loadings to each of the ten major tributaries, effectively limiting nutrient loads to the Bay. The Program has effectively implemented major pollution prevention efforts for nutrient management for fertilizers, integrated pest management in agriculture, and phosphate detergent and tributyltin bans.

Non-compliance rates for point source dischargers have been reduced by 70% since 1990. And finally, the toxic release inventories for the whole watershed indicate a 43% reduction in reported toxic emissions/releases from 1987 to 1990, compared to a national decrease of 22% from 1988 to 1991.

To support this work, the Bay Program has developed a sound technical and scientific data base to support its environmental targets and its focus. The Program established the scientific linkages between Bay grasses and water quality and the role of fin fish and shellfish in the assimilation of pollutants. The Program pioneered biological nutrient reduction technology for point source nitrogen and identified and quantified the contribution of airborne deposition of nitrogen to the Bay, linking water quality and air models.

The Chesapeake Bay Program has an ambitious and exciting vision for its future work in the Bay. For example, the Program will heighten its emphasis on tributaries and shallow habitat areas, including the Anacostia and Patuxent Rivers. The Program will look also into new technologies to assess air/water nitrogen exchanges, the interaction between water quality and living resources, and those interactions between land and water.

Earlier this year, Senators Sarbanes, Mikulski, Warner, Robb, Wofford and Specter introduced S. 567, entitled the "Chesapeake Bay Restoration Act of 1993." Building upon the Chesapeake Bay Program authorized in the 1987 Water Quality Act, the bill addresses priorities set out in the 1987 Chesapeake Bay Agreement and the 1992 amendments to the agreement. We are generally supportive of the concepts contained in the bill, in particular: the enhancement of federal agency cooperation and coordination; improvement of federal facility compliance; and, promotion of local and private sector participation in the development and implementation of management, conservation and restoration plans. Similarly, we believe that provisions to promote the demonstration and showcasing of various techniques for restoring and enhancing wetlands, submerged aquatic vegetation and forest riparian zones in the Bay move in the right direction. We also agree conceptually with provisions in the bill that would provide State and local governments with better tools to make sound land management decisions.

THE GULF OF MEXICO PROGRAM

The Gulf of Mexico is essential habitat to approximately 75% of North America's migratory birds, several endangered species, and economically important fisheries for shrimp, shellfish, and fish. Its coastline is longer than the Pacific Coast and nearly as long as the Atlantic Coast. Unlike most estuaries in the east and west coasts of the U.S., Gulf estuaries are primarily shallow and wind-driven. These estuaries average only eight to ten feet in depth. They are productive because of the warm climate, in-flows of nutrients, the balance of fresh and salt waters, and the vegetated habitat. About one-half of the nation's wetlands are found there and about one-sixth of the U.S. population now lives in Gulf States and is expected to increase by 26% over the next 20 years. In addition, the Gulf has four of the top ten busiest U.S. ports and 90% of all offshore oil and gas production in the U.S.

Some of the environmental challenges facing the Gulf of Mexico are crosscutting and complex in nature which will require assessment and Gulf-wide solutions while some issues are more appropriately dealt with on a more local scale. The challenges include: habitat losses; impaired freshwater inflow; nutrient enrichment from two-thirds of the continental U.S. and from coastal septic systems and agriculture among other sources; marine debris; toxics and pesticide contamination; and, coastal and shoreline erosion. Each of these problems requires long-range solutions involving many key parties across the Gulf. EPA in partnership with the five Gulf coastal States and other federal agencies, began the Gulf of Mexico National Program in 1988 to address the cross-cutting, system-wide environmental problems in the Gulf. In all, over 400 different groups and organizations are represented in an overall committee structure.

The Gulf Program is designed to be holistic in its approach and to address risks that are broad in scale and that extend to the entire ecosystem. A system-wide approach requires extensive coordination, and the Program has served as an in-the-field experiment of a full environmental partnership. We have found that the Gulf is a vast and infinitely complex ecosystem whose collective environmental threats easily overwhelm the individual capacities of federal and State environmental programs. Consequently, the Gulf program, if it is to succeed, must remain a collaborative partnership of all of the State, local, citizen and private stakeholders. The federal government must catalyze and assist in the proper and effective coordination of these activities.

In this session of Congress, Senator Graham and former Senator Krueger introduced bills to strengthen efforts for environmental protection in the Gulf. These bills, S. 83 and S. 686 respectively, generally aim to establish a strategic plan for the Gulf and to create a commission or governing body to help to direct this effort.

Because the Gulf of Mexico Program is a partnership effort among many several agencies, the best recommendations regarding what is needed in the Gulf are the principles recently articulated by our federal partners. These include: (1) some legislative recognition of the Gulf of Mexico is appropriate; (2) partnership among federal agencies should be full and shared, although one federal agency can act as the coordinating hub for cross-cutting Gulf activities; (3) the Program should develop a strategic plan which assesses ecosystem-wide (not simply local) problems and make recommendations for actions necessary to collaboratively address these Gulf-wide environmental risks; and (4) each federal partner agency should support activities within the strategic plan and implement these actions through their own authorities with funds obtained through their own appropriations process. Each of these principles will help to ensure success in the Gulf of Mexico. As such, they can serve as an initial basis for discussions regarding appropriate Gulf of Mexico legislation.

THE NATIONAL ESTUARY PROGRAM

In addition to these large waterbody programs, EPA manages the National Estuary Program under the CWA. The NEP was established in 1987 under Section 320 of the CWA. Its mission is to identify nationally significant estuaries, protect and improve their water quality, and enhance their living resources. Among the criteria for national significance is the presence of unique, threatened, or endangered species and habitats within the proposed estuarine study area.

The NEP embodies the watershed protection approach by addressing problems within the watershed as a whole rather than by focusing on one problem at a time. As a result, this program involves high levels of coordination among the many stakeholders. For each estuary designated, a Management Conference is convened that includes representatives from the State and local governments, businesses, citizen groups, academia, and environmental and other citizens' groups. The Conference identifies and addresses environmental risks to the estuary through adoption of a Comprehensive Conservation and Management Plan (CCMP).

The NEP currently includes 21 programs across the nation. Although each estuary has unique characteristics, many share common environmental problems. These include eutrophication, toxic substances and metals, pathogens, and changes in living resources and their habitats. Solutions to a number of these problems are being developed and tested in individual NEP estuaries.

The NEP is a successful program in a larger sense. NEPs are achieving consensus and results. They provide an excellent model for collaborative problem solving by key stakeholders concerned about a local resource. The NEPs have also demonstrated the value of monitoring. Monitoring is crucial in helping to define estuary functions on an ecosystem-wide basis and to determine the effectiveness of the actions taken under the CCMPs. Monitoring results can then be used for developing needed "mid-course" corrections. In addition, volunteer monitoring is often used to achieve & better understanding of an estuary's functions and to enlist citizen support in identifying and managing estuarine problems.

With respect to CWA reauthorization, Congress needs to be aware that, under current law, the NEP can provide no financial assistance to Management Conference for the oversight and facilitating of CCMP implementation. Under § 320(b), the Management Conference must coordinate and facilitate the implementation of the plan, assess the effectiveness of the plan, and review proposed federal projects for consistency with the CCMP. These statutory responsibilities cannot be carried out until the CCMP is completed and implementation begins, yet § 320 provides no grant authority to support these activities. While we cannot support a new grants program for implementation, we would not oppose authority to award grants from

currently-available funds to Management Conferences to support limited oversight activities.

We also appreciate the support expressed for the NEP in Senator Lieberman's bill, S. 815. While we agree that funding implementation of CCMPs is important, the State Revolving Funds (SRF), construction grants program and nonpoint source program already provide priority consideration to activities in approved CCMPs. Thus, we believe that States should revise their SRF funding priorities to reflect CCMPs instead of requiring a percentage of the State revolving fund to be set aside for implementation of CCMPs. The virtue of the SRF is the high degree of flexibility it offers States. Set-asides limit this flexibility and rarely match actual funding needs for the targeted areas. We believe that the major responsibility for implementation remains with the States and localities where the benefits will be realized. Nevertheless, EPA, the States and the public together have invested millions of dollars in developing CCMPs, and we agree that we must determine how we can best protect and build on those investments. Accordingly, we support a strong role for EPA in facilitating implementation.

EPA also does not support the authorization levels of \$4 billion in FYs 1994 and 1995 and \$5 billion in FYs 1996-2000. These levels are higher than national fiscal constraints will allow. We support the President's investment proposal, which would provide \$7.2 billion in capitalization grants between FY 1994 and FY 1997 to capitalize State revolving funds.

CONCLUSION

We believe each program discussed above illustrates the application of the Watershed Management approach. Each program is characterized by cooperation among EPA, other federal agencies, States, local government and the public to identify problems and implement solutions in a holistic, integrated, cost-effective way. Many of these programs also exemplify multi-State coordination. By focusing on watersheds as a whole—and the valuable ecosystems they contain—these programs attempt to protect not only the water chemistry but also the aquatic habitats for the systems' living resources. As John Muir, the father of our conservation movement, so eloquently wrote in 1911 in one of his nature journals, "When we try to pick anything out by itself, we find it hitched to everything else in the universe." Muir's quote captures the very essence of Watershed Management. Watershed Management is essential to ensure that we succeed in restoring and protecting our watersheds as sources of food, livelihood, recreation, wildlife habitat and aesthetic beauty. As we embark on a more comprehensive, nationwide approach to Watershed Management, we believe that these programs can teach us valuable lessons.

REAUTHORIZATION OF THE CLEAN WATER ACT

WEDNESDAY, AUGUST 4, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES, AND WILDLIFE,
Washington, DC.

REGIONAL ISSUES

The subcommittee met, pursuant to recess, at 9:40 a.m. in room 406, Dirksen Senate Office Building, Hon. Bob Graham [chairman of the subcommittee] presiding.

Present: Senators Graham, Mitchell, Lautenberg, Chafee, Lieberman, Wofford, and Baucus.

OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Senator GRAHAM. I call the subcommittee to order.

Today the subcommittee continues its review of Clean Water Act issues and turns its attention to a number of concerns to the regions of America.

The topics we will cover today will demonstrate the differences in water issues that face many regions of the country.

At previous hearings we have examined watershed planning as a means of recognizing variances in ecosystems and types and sources of pollution. Witnesses have told us that these differences justify flexibility in the solutions we craft to address water pollution problems.

There are many programs in the Clean Water Act that already recognize these regional differences.

In 1987, Congress created the national estuary program to take a watershed approach to water quality management in the Nation's estuaries. To date, 21 estuaries are in the program. We will learn today about the progress the program has made in addressing pollution along our coast. We will also discuss how we can benefit from those lessons in encouraging watershed planning for the rest of the country and how these programs can be merged to avoid duplication.

Congress also created the clean lakes program, a small but successful program aimed at controlling pollution of our Nation's lakes. The program recognizes the differences between what happens when contaminants enter lakes compared to free-flowing rivers and streams.

The clean lakes program also took a watershed approach, recognizing the need to address pollutants at the source rather than simply eliminating the symptoms in the lakes, themselves.

Today we will learn about the special problems faced by those arid states in the west whose low annual rainfall pose unique problems in complying with national standards. We will also examine continuing problems in several of our Nation's largest ecosystems and water bodies, including the Great Lakes, Long Island Sound, and the Chesapeake Bay—all of which have programs currently in place.

We will also look at other ecosystems such as the Gulf of Mexico and the Mississippi River, which seek new programs to help them address their problems.

Finally, we will look at the special problems of some of our larger cities and other regions of the country as they attempt to comply with the requirements of the Clean Water Act.

Because of the breadth and sheer number of these issues, today's hearing will be somewhat different than the others that we have held in the past. Our hearings have used an informal format to encourage dialog. Today's hearing is going to be primarily to receive information about the specific needs of these variety of programs.

We have over 20 witnesses who have requested to give testimony. We ask that all of our witnesses be as concise as possible and confine their remarks to five minutes.

It is our intention to receive all of this testimony today, and to do our best to accommodate the busy schedules of our colleagues in the House and the Senate who have asked to testify.

The subcommittee appreciates your patience as we attempt to move through this full agenda.

Before we address some of the specific regional issues, I want to begin with some of the regional programs.

At this time, I would ask the members of the first panel to come forward as we receive the opening statements of our colleagues who have joined us today, beginning with the majority leader of the United States Senate, Senator George Mitchell of Maine.

**OPENING STATEMENT OF HON. GEORGE MITCHELL, U.S.
SENATOR FROM THE STATE OF MAINE**

Senator MITCHELL. Thank you, Mr. Chairman, for holding this hearing on the water quality issues facing our coastal waters, estuaries, and lakes.

Six years ago the congressional Office of Technology Assessment reported that,

In the absence of additional measures to protect our marine waters, the next few decades will witness new or continued degradation in many estuaries and coastal waters around the country.

Since then, witnesses before this committee and others in the scientific community have reaffirmed this basic conclusion. Coastal pollution problems range from closed clam flats in New England to closed beaches in New Jersey to a dead zone in the Gulf of Mexico, to sediment contamination in Puget Sound.

I have introduced, with Senator Lautenberg, legislation to expand and strengthen elements of the Clean Water Act related to coastal pollution. A key first step is to renew the national estuaries

program, which has helped many coastal areas address pollution problems, including communities around Casco Bay in my home State of Maine.

In addition, we need new authority to take special care of impaired coastal waters, to assure that water quality standards apply to all coast waters, to expand public education, and to assist communities in dealing with overflows of raw sewage from combined storm and sewer systems.

I look forward to comments on this coast protection legislation and to working with the committee to include the provisions of the bill in the Clean Water Act reauthorization.

I also hope that this reauthorization of the Clean Water Act can provide much-needed attention to the water quality problems of our Nation's freshwater lakes. Lakes represent an incomparable recreational resource in many areas of the country. Indeed, many Americans think of clean water in terms of the quality of the lake where they swim or boat.

Unfortunately, the EPA has reported that 20 percent of our lakes are impaired, and an additional 25 percent are threatened with impairment. When almost half our lakes are in real or potential trouble, it is time to rethink our efforts to protect lake water quality.

Section 314 of the Clean Water Act provides for some assistance to States in protecting lakes, but this effort can be improved.

I have introduced legislation building on the existing clean lakes program and expanding it in several key areas. My bill would increase research on lake quality issues, provide for development of water quality standards for lakes, consolidate and refocus existing grant programs, expand EPA support for volunteer programs for lake protection, and provide for a gradual phase-out in the use of phosphate in household laundry detergent.

These measures, in combination with the renewed efforts to control nonpoint sources of pollution proposed in the bill introduced by Senators Baucus and Chafee, will take us a long way toward cleaner lakes and improved recreational opportunities for millions of Americans.

I look forward to working with you, Mr. Chairman, with Senator Lautenberg, with Senators Baucus, Chafee, and others on this committee on these important parts of our clean water program.

I want to apologize in advance to the witnesses that, because of other duties on the Senate floor, I will not be able to stay for the testimony, but I look forward to reviewing that testimony, I know the committee will learn from these witnesses.

Thank you, Mr. Chairman.

Senator GRAHAM. Thank you very much, Mr. Leader.

Senator Lautenberg of New Jersey?

**OPENING STATEMENT OF HON. FRANK R. LAUTENBERG, U.S.
SENATOR FROM THE STATE OF NEW JERSEY**

Senator LAUTENBERG. I thank you, Mr. Chairman.

I am pleased that the subcommittee is addressing coastal pollution issues today. Protecting our coasts should be one of our highest environmental priorities.

Incalculable is the value to every family that spends a day together at the beach. More easily measurable, however, is the income that our States derive from the more than 160 million people who visited our shores in 1992.

In my home State of New Jersey, \$9.5 billion was collected from tourism expenditures in four coastal counties last year. Furthermore, in 1991 353,000 people provided services to these visitors in some capacity, making tourism the number one employer in the State. Such values cannot be overlooked.

Mr. Chairman, I want to focus my comments today on the goal of the Clean Water Act, which is to make our waters swimmable and fishable.

While water quality has improved since the act's enactment, we have no way to measure our progress toward making waters swimmable because States do not regularly test beach waters to determine whether or not they are safe for swimming. And where States do test their waters, EPA guidelines recommend using a monthly average to determine whether a beach is safe for swimming. But monthly averages can mask unsafe water quality that may exist on any given day.

Today, throughout our Nation, families are splashing in the waves. They believe that they are engaging in a safe activity and deriving nothing but joy and recreation. But what if the water they are swimming in is, instead, contaminated with bacteria at levels that can make them sick? How do they know that?

This is a case where ignorance is not bliss. All of those enjoying the ocean this summer have a right to know whether the water that they are swimming in is clean and safe, and yet many States use inadequate techniques to measure bacteria levels in beach water, and others conduct no water quality monitoring at all.

Furthermore, the National Resources Defense Council recently found that even when the States do monitor water and discover unsafe bacteria levels, they don't always tell the public.

A high bacteria level can cause a beach closure in one State, while in another people may be allowed to swim in water, despite equal health risks.

In an attempt to remedy this problem, Senators Bradley, Boxer, and Feinstein have joined me in introducing S. 997, the Beaches Environmental Assessment Closure and Health Act.

The beach bill will help ensure the safety and beauty of coastal beaches across the country by establishing uniform testing and monitoring procedures for bacteria and floatables in marine recreation waters. It will also require that beach-goers are notified through advisories or beach closures whenever the standard is exceeded.

A coalition of groups from across the country has written a letter in strong support of S. 997, Mr. Chairman, and I would ask that this letter be included in the record.

Senator GRAHAM. Without objection, so ordered.

[See attachment to Dawn Martin's Testimony, p. 922.]

Senator LAUTENBERG. Mr. Chairman, I, too, have other hearings and meetings, and therefore will be unable to remain.

I urge that the subcommittee add its support to this legislation, to the Clean Water Act, and in doing so to recognize the importance of protecting public health at our Nation's beaches.

I thank you once again for holding this hearing.

Senator GRAHAM. Thank you, Senator.

Senator GRAHAM. Our first panel includes Ms. Dawn Martin of the American Oceans Campaign; Mr. Richard Wedepohl of North American Lake Management Society; and Mr. George Brinsko, President of the Western Coalition of Arid States.

I would call on the members of the first panel in the order in which they were introduced for their opening statement.

Ms. Martin?

**STATEMENT OF DAWN MARTIN, AMERICAN OCEANS CAMPAIGN,
WASHINGTON, D.C.**

Ms. MARTIN. Thank you, Senator.

As you said, my name is Dawn Martin, and I am the Director of the Washington Office for the American Oceans Campaign, and the Coordinator of the National Coastal Caucus.

On their behalf, I wish to express my thanks to Chairman Graham for inviting us to testify, and for all the work that he and the committee staff have done in setting up these hearings.

In addition, I applaud Senators Baucus and Chafee for introducing S. 1114, which has served as a vehicle for discussion in these hearings.

Aquatic ecosystems worldwide are being severely altered or destroyed at a rate greater than at any other time in human history. Protection of the functions of those aquatic ecosystems have been largely ignored; therefore, we are pleased to see that the committee has acknowledged that clear hydrological, ecological, and economic basis for focusing on broader aquatic ecosystems management through its watershed planning provisions in S. 1114.

Watershed planning, however, is not a completely novel concept. Attempts have been made at the local, State, regional, and Federal levels to do successful watershed planning for many years.

Created by section 320 of the 1987 Clean Water Act, the NEP is an excellent example of comprehensive watershed management. The NEP, itself, is also modeled after the Great Lakes and the Chesapeake Bay programs.

Estuaries form transition zones between freshwater and marine ecosystems and, as a result, are among the most productive natural systems. But, in spite of their high value, intense use, and frequent overuse, estuaries only recently have become recently recognized as a unique and severely depleted resource.

The NEP is designed to identify estuaries of national significance and to establish a process for improving and protecting their water quality, habitat, and living resources.

In the past several years, we have compiled comments on the NEP and, as a result, we have developed a list of priority problems and potential solutions to strengthen the program. These suggestions essentially became the basis of Senator Lieberman's Water Pollution Control and Estuary Restoration Act, S. 815.

Similar frustrations with the program were experienced across the country, and therefore participants have called for a national solution to address these problems. Essentially, there are five main provisions which would be strengthened by incorporating the language of S. 815, as well as specific parts of the Coastal Protection Act introduced by Senators Mitchell and Lautenberg. These include:

Number one: mandating implementation of CCMPs. S. 815 clarifies that implementation of CCMPs is a nondiscretionary duty of EPA. S. 1114, on the other hand, expands section 320 to provide grants to pay for activities necessary for the implementation of CCMPs. It also reiterates that implementation activities are eligible for SRF funding.

S. 1199 also acknowledges the need for Federal involvement in implementation by extending management conferences to oversee implementation of improved plans.

Two: requiring strict time frame guidelines. The five-year time frame allowed under section 320(e) should not be extended simply to allow the planning process to continue. S. 815 sets forth scheduling deadlines to ensure a timely planning and implementation process and to discourage the process from stalling.

S. 1199 also adds language to tighten up the planning process by requiring that implementation plans include a detailed financial plan indicating the Federal, State, and local funds needed to implement identified corrective actions.

Third: increasing the role and visibility of EPA in the program. S. 815 requires EPA to participate more actively in ensuring full coordination among the appropriate agency. EPA is also directed to promulgate guidelines setting out criteria for the development, approval, and implementation of CCMPs.

S. 1199 requires EPA to review and report on the progress of the management conferences.

The fourth point is the need to strengthen citizen participation. S. 815 acknowledges that a public involvement is a vital function of every conference, and it expands the participation at all levels of the program.

Finally, we need to include a funding mechanism to ensure implementation. Due to State budget shortfalls and the lack of Federal support, many States have been unable to fully implement their management plans. It is imperative that additional resources be provided if implementation is to be successful; otherwise, the Federal funds expended for crafting the plans will be wasted.

S. 815 increases funding for the SRF program at \$4 billion and then to \$5 billion, and creates a set-aside specifically for the CCMP implementation.

To recap, assuring the development of the most efficient plan for tackling pollution problems within estuaries is the major theme of S. 815. Senator Lieberman is to be commended for his focus on the economic and environmental costs associated with cleaning up these valuable watersheds.

We encourage the committee to amend section 607 of the bill to incorporate the Lieberman language.

The committee's version of the Federal Water Pollution Control Act can easily be amended to address our concerns about the NEP.

We strongly support the above-mentioned provisions, but recognize the need for implementing the CCMPs, and we also recommend linking the national estuary program with the watershed provisions of the committee's bill.

Title one and title three both provide an opportunity for linking the national estuary program with watershed provisions.

I am out of time, but I wanted to just quickly mention the Mitchell-Lautenberg Coastal Protection Act also includes several provisions that we are in support of, in addition to the national estuaries language, including the creation of a coastal environment toxics release strategy, focusing on the effect of industrial discharges, development of a national marine water quality education program, and that the bill significantly strengthens requirement and enforcement provisions for marine sanitation devices.

It also calls for the development of marine water quality criteria and standards, and significantly restricts ocean beach discharges.

The final provision or bill that I wanted to mention was Senator Lautenberg's beach bill. Mr. Lautenberg did a tremendous job in identifying that for me, so I won't expand on it.

I also was going to ask that the letter that Senator Lautenberg mentioned be incorporated in the record.

So I'd just like to say that we strongly support the inclusion of the beach bill, certain provisions of the Mitchell bill, as well as the Lieberman bill when this committee reauthorizes the Clean Water Act.

Thank you.

Senator GRAHAM. Thank you very much, Ms. Martin.

We have been joined by the ranking member of the subcommittee, Senator Chafee of Rhode Island.

Senator Chafee?

Senator CHAFEE. Thank you very much, Mr. Chairman. I apologize for being a few minutes late.

I don't have a statement, and we've got a long list of witnesses, so I'll do everything I can to cooperate to move right along.

Senator GRAHAM. Thank you very much.

Mr. Wedepohl?

STATEMENT OF RICHARD WEDEPOHL, NORTH AMERICAN LAKE MANAGEMENT SOCIETY, MADISON, WISCONSIN

Mr. WEDEPOHL. Thank you, Mr. Chairman.

Please know that our organization is also very appreciative of the opportunity you have provided for us to testify.

As you noted, today I am representing the North American Lake Management Society, which is an international organization that is comprised of citizens, lake communities, scientists, engineers, lake biologists, lake management professionals, and many others.

Recently, I have also served as chair of Water Quality 2000's Urban and Rural Runoff Challenge Team, which focused on defining solutions to our Nation's water quality problems that originate from rural and urban runoff.

In my real life I am employed and get my paycheck from the State of Wisconsin's Department of Natural Resources, where I oversee the nonpoint source and lake planning program.

I am here today on behalf of our Society to offer to this subcommittee testimony relative to S. 1198, which you heard Senator Mitchell describe very eloquently; and also S. 1114.

I might add that we are very fortunate that Senator Mitchell hails from a lake State, and also our chairman hails from a State that is very rich in lake resources.

Let me begin by stating as strongly as I possibly could our support for S. 1198, Senator Mitchell's bill. This is without a doubt the finest piece of legislation our organization has had the opportunity to comment on. Our compliments to Senator Mitchell and the staff who have worked hard over the past three years to put this piece of legislation together.

S. 1198 has many fine provisions—provisions which build upon the 17 years of experiences and lessons learned through a highly successful section 314 clean lakes program.

While our Nation's lakes would certainly benefit if this bill were adopted independently, it would be our preference to see it rolled in its entirety into the Clean Water Act amendments. It is our belief that by doing so the many strengths of this piece of legislation would spill over and help out the other new nonpoint source and watershed initiatives which are an important part of S. 1114.

The bottom line is we don't feel that it is necessary to start over again and begin at the bottom of the learning curve. Much of the lessons have been learned.

You have also heard many of the facts and figures on the quality of our Nation's resource. I'm sure those figures haven't always been the same, but the gist of it is there are still a lot of problems.

You also heard about the critical nature of nonpoint source pollution watershed approaches and involving citizens in the effort. We certainly add our support to this.

However, what has not been stated very well, we don't believe, is the critical need that exists to target and to focus our newer nonpoint source and watershed initiatives on our most sensitive fresh-water resources, our Nation's lakes and reservoirs.

The success of the section 314 program has never been questioned. The original model was based on sound science, was driven by needs identified at the grassroots level, and has been implemented with the principle of the need to build strong State/local partnerships to solve watershed problems.

It has received several accolades. NRC recently called it a model of Federal restoration efforts with regard to its emphasis on the causes of lake problems and local and State participation.

EPA's former head of Office of Water, Lajuana Wilcher, recently described the program as a quintessential example of empowering citizens to work closely with their local, State, and Federal Governments in achieving a common goal.

And recently an EPA review, which I have copies and will give you, also highlighted its successes.

Finally, I think it is important to note that this program was accomplished with very little budget support. There are some issues there that we can't get into now. But it has operated on an annual appropriation of less than \$10 million per year.

Now, with Senator Mitchell's bill, there exists a wonderful opportunity to build upon these past successes to revise and fine-tune

and broaden the scope of this program. I won't discuss the individual sections Senator Mitchell did, but I will say that they all are significant and important, whether it be the research, the water quality standard components, the national phosphate ban whose time has certainly come, and program coordination and education elements of the bill.

Overall, it is an extremely well-conceived and developed and fine-tuned bill. It has few flaws and is a logical extension of the 314 program.

However, given the low funding—and I know you have heard this before—provided by this bill, we feel it is essential that lakes be given special attention or given some reference into our new nonpoint source and watershed initiatives that are proposed in S. 1114. It is important that they be targeted.

Our momentum has been on stream and river focused efforts, and lakes have not had the attention because most of our lakes have not had point sources going into them.

In regard to S. 1114, NALMS is certainly supportive, while we have a general sense the bill is perhaps more top-down than bottom-up in design and maybe not enough emphasis has been placed on the need to develop State and local infrastructure.

Certainly some of these weaknesses would be corrected if the citizen-initiated clean lake projects posed in 1198 were effectively incorporated into this bill.

As stated earlier, and I can say it again, the State/local partnership structure and model for effective, voluntary local watershed management has already evolved through the clean lakes program.

Finally, one comment related to section 402(p), the stormwater element of the bill. I have had the experience of having to work with the stormwater program and have had the opportunity to go through its development with EPA and its implementation in the States.

NALMS and many others of us are still very concerned that there exists little incentives for State or local programs to address control of post-development stormwater runoff under section 402(p).

Presently, EPA and State implementation of the permitting program does not effect post-development runoff. It is not well understood. A lot of the States already deal with this independently, but those States that don't have their own legislation are not doing it very well.

New construction activities greater than five acres in size, for instance, are required to have stormwater permits. These stormwater permits are for the construction activities. Silt fences are put in, mulching is done, and whatever, to control sediment. Stormwater is controlled during construction. However, there are no requirements that post-construction development controls be part of this.

For instance, the five-acre site could be completely paved over and water would run off and go directly into the lake without any controls whatsoever.

We feel that perhaps another section needs to be added to this bill to address this weakness.

We sincerely appreciate the courtesy and consideration you have extended to us.

Thank you.

Senator GRAHAM. Thank you very much.
Mr. Brinsko, Western Coalition of Arid States?

**STATEMENT OF GEORGE BRINSKO, PRESIDENT, WESTERN
COALITION OF ARID STATES, TUCSON, ARIZONA**

Mr. BRINSKO. Good morning, Mr. Chairman and members of this subcommittee.

I am the President of the Western Coalition of Arid States, otherwise known as WESTCAS. I am also the Director of Wastewater Management for Pima County, Arizona.

WESTCAS has requested the opportunity to testify before your subcommittee in order to inject an arid west perspective in these discussions in the clean water reauthorization.

The Western Coalition of Arid States was formed in 1992 by a group of western water and wastewater agencies concerned about the manner in which water quality and water resource management issues were being addressed in states throughout the arid west—areas with less than 15 inches of annual rainfall.

In the last 18 months, WESTCAS has attracted more than 50 members from five western States—Arizona, California, Colorado, New Mexico, and Nevada. Our main objective is to assist in the development of water quality regulations, policies, and laws which promote the protection of arid and semi-arid ecosystems throughout the west.

I moved to Pima County from Pittsburgh, Pennsylvania, 14 years ago to establish the first regional wastewater treatment system in Arizona. One of my first, most vivid experiences, upon my arrival, was standing beside the Santa Cruz River, a river with no water. Exhibit No. 1 will illustrate that.

The arid west is laced with arroyos and dry rivers such as the Santa Cruz. They are actually ephemeral streams. These streams only flow in direct response to one of our periodic powerful rainstorms, as illustrated in Exhibit No. 2 of our submittal.

I want to emphasize from the outset that WESTCAS supports the goals and objectives established by the Clean Water Act. Our concerns rise from the application of the act to the arid west environment. Concepts and regulations that make perfect sense when developed in terms of wet ecosystems have major flaws when applied to arid west water and wastewater situations.

WESTCAS members and other water and wastewater agencies must perform a balancing act between competing forces. On one hand, we must fulfill our mandated responsibility to protect the environment by meeting NPDS permit requirements but, on the other hand, we must convince our elected local officials and ratepayers that we are spending increasingly limited resources wisely and efficiently.

It is difficult for us to justify expending millions of dollars to comply with increasingly stringent standards for effluent discharges when such additional improvements will result in no measurable net environmental benefits.

The west needs the flexibility to adapt water quality programs to local and regional ecosystems and conditions, particularly in the absence of federal dollars for these national mandates.

When effluent is discharged to certain reaches of these ephemeral streams, lush riparian ecosystem is often created, as shown in Exhibit No. 3. We believe that we have a major responsibility to protect such ecosystems.

The reauthorization needs to address the issues essential to the management of the water and wastewater resources of the arid west. We respectfully request the committee to add an "Arid West" Section to S. 1114, with a finding that recognizes the unique nature of arid west ecosystems.

We urge the committee to consider the 14 amendments attached to our written submittal in drafting the "Arid West" section of the bill to address these special needs. To name just a few: authorize and fund research to develop appropriate water quality criteria; the utilization of reclaimed water; the interaction between the environmental, social and economic effects of policies, regulations, and permits; and the use of biomonitoring to act as a warning signal.

WESTCAS has prepared specific language and comments on these issues for the committee's consideration in the reauthorization process. However, in recognition of the committee's time constraints, I will not review all these statements at this time, but I would like to address the need to emphasize research in a reauthorization legislation.

WESTCAS believes that there is only one way we can be certain of protecting our arid ecosystem, and that is for us to conduct the basic scientific research and demonstration needed to identify what is there and what is needed to protect it.

There is a very real danger that current federal policies are simply shifting the cost of such needed research and demonstration projects to local jurisdictions. Congress can achieve tremendous economies of scale by adopting a regional approach to the science of arid lands/water quality management.

Both the federal government and many western interest would benefit from a federal partnership on these projects.

WESTCAS urges the committee to add a "Research Section" to S. 1114, including authorization language and suitable appropriations, to encourage the development and implementation of research and demonstration projects to the arid west.

As part of this "Research Section", WESTCAS requests that this subcommittee incorporate into the act the authorization for the establishment of a regional Water Quality Research Project. This would create a program to conduct the research needed to develop appropriate water quality criteria documents for arid ecosystems throughout the west.

Even though we believe this research program is already authorized in the act, we would like the subcommittee to give its direct authorization of this program.

In closing, Mr. Chairman and members of the subcommittee, on behalf of WESTCAS, I would like to thank you once again for allowing me to appear before you.

Senator GRAHAM. Thank you very much, Mr. Brinsko.

I want to thank all of the members of this panel for an excellent, concise presentation on programs that are already in effect or pro-

grams that you recommend to take account of some of the special needs of the arid west.

I would like to ask a few questions.

First, Ms. Martin and Mr. Wedepohl, in terms of the national estuarine program and the national lakes program, both of those were established in response to a set of problems that were seen within those two particular types of water bodies in America. How well do you think the two national programs in their years of existence have dealt with the problems that lead to their original establishment?

I guess, to put it another way, if you had laid out the doctor's diagnosis of the illness at the time the programs were adopted, has the prescription those programs were administered helped make the patient better?

Mr. WEDEPOHL. Absolutely, with reference to the 314 clean lakes program. I was around and involved with the program, although I was barely around when the program first got started. We started in Wisconsin and the EPA program was adopted after it.

I think the original approach was very sound and recognized the interdisciplinary problems of lakes and recognized that pollution sources come from a variety of places, not just point sources, and recognized that once things get into lakes they tend to stay there and you've got sediment problems.

It recognized that citizen initiatives are important. If the citizens are concerned locally and they want to do something, they can become involved. And if they do become involved, by golly, they find a way to get the problem done.

Probably one of the strengths of the clean lakes program is that we didn't have a lot of understanding of the problem back in the early 1970's. We are still learning. And perhaps as a result of that the flexibility that the program offered to the States has turned out to be a very strong asset.

It was not very prescriptive. It said to go out and assess the problems, find out where they are coming from, and come up with the recommended solutions, whether it be nonpoint source or point source control, or whatever—septic tanks, whatever.

As a result of that, there was a great deal of monitoring done. There was some research, better understanding was accomplished, citizens got involved, and the program has gone on from there and has been very successful.

Senator GRAHAM. Could you give an example of a specific water body in your State or elsewhere that has benefited by this program?

Mr. WEDEPOHL. I sure can. I could give some in Florida, too. But one I recently finished working on, Lake Delavan, which now Secretary Aspin was very much involved with and took a personal interest in. It was a very large lake in southeast Wisconsin, close to Chicago, very important to our tourism industry, and so on. It was sewered as part of the original Clean Water Act requirements, and point sources of pollution were actually diverted away from the lake at a cost, I might add, back in the late 1970's, of \$40 million.

The lakes program got involved when all the citizens said, "Wait a minute. Our lake hasn't gotten any better. As a matter of fact, it has gotten worse."

They got involved in the clean lakes program. A cooperative agreement with the U.S. Geological Survey was set up to actually measure what is coming into the lake. Detailed watershed inventories were conducted as part of our State nonpoint source program. A bit of the Corps of Engineers has been involved. A whole variety of agencies got involved. Citizens took initiative on doing this and cost-shared the program.

As a result of the monitoring effort, it was determined that we removed the point sources, and they were the most important source of the problem at the time, but they weren't the only problems. The other problems were the nonpoint source problems which have been corrected.

In fact, every single land owner in this over 15-square-mile watershed, because of the local initiative, has cooperated and has implemented BMPs on the land. There are still some problems with the new development, which I mentioned has stormwater to deal with.

The other thing was that we cooperated with the Fish and Wildlife program. Because of the degradation that had occurred from the past point sources, the fisheries had degraded. The lake was left with a rough fishery rather than the sport fishery it used to have. These fish had the nasty habit of trying to make their habitat the way they liked it and continued to exacerbate the problem. They'd stir up the bottoms and they'd recycle nutrients and things like that, and the algae blooms would continue.

So we cooperated and, through the use of some fish and wildlife funds the lakes were treated and the fish removed and restocked.

Finally, the lake sediments were treated with alum to lock phosphorus in the lake sediments.

It was a comprehensive approach, but the final result is, because of the citizen involvement again, principally, we have a very, very successful clean lakes project. The lake has gone from one where you couldn't swim to one where people are probably swimming in it too much now. It is almost a problem with the boats.

Senator GRAHAM. Thank you very much.

Mr. WEDEPHOL. You are welcome.

Senator GRAHAM. Senator Chafee?

Senator CHAFEE. Mr. Wedepohl, in Wisconsin have you banned phosphates?

Mr. WEDEPHOL. Absolutely. We originally had a sunset clause, which everyone was concerned about after we banned phosphates, because our legislators were concerned that the clothes wouldn't be as white and all our washing machines would break down. It wasn't even an issue any more.

Senator CHAFEE. OK. And do you see the results?

Mr. WEDEPHOL. The results have shown up mostly in the measurements at our wastewater treatment plants where phosphorus loads to the treatment plants have been reduced approximately 30 percent.

I think the national average is something like 20 percent reduction where States have adopted bans. I think 20 States have adopted bans.

Senator CHAFEE. What do the principal detergent manufacturers say? How do they do it? Do large manufacturers just do it, not include it any more?

Mr. WEDEPOHL. Absolutely. I have the good fortune of having a brother-in-law who is in the upper echelons of Proctor & Gamble, and we talk about this all the time, so we have something to talk about.

Senator CHAFEE. You bore from within, do you?

Mr. WEDEPOHL. He says the bill—

Senator CHAFEE. So what do they do? We've got to make these answers crisp, because I don't have much time..

Mr. WEDEPOHL. I'm sorry. There are other builders in the detergents and the new detergents are just as effective. The distribution problem is—

Senator CHAFEE. So it works? And then, in the States that don't ban it, does somebody like Proctor & Gamble still have it and sell it in those States?

Mr. WEDEPOHL. I'm not sure if they still maybe have a few products.

Senator CHAFEE. In other words, it would seem to me if, because of the national distribution system, if you've got several key States you'd think it would be simpler for the manufacturer just to ban them all—

Mr. WEDEPOHL. Absolutely.

Senator CHAFEE.—and not have any of it for the distribution purposes. Well, I guess that's up to us to find out the answer to that.

But outside of what you see within the treatment plants, do you see the results of it in your lakes with less algae and so forth?

Mr. WEDEPOHL. It is hard to measure because of the nonpoint sources and other things that are still dominant.

Senator CHAFEE. At any rate, it is a major step that we could take.

I must say I'll tell Senator Mitchell what you said about his legislation. That will please him. Any witness that comes before one of these committees and says about a Senator's legislation, "This is without doubt the finest piece of legislation our organization has ever had an opportunity to comment on," I think Senator Mitchell would do about anything you want for that.

I would also just briefly comment on what Ms. Martin said. This is coming home to us right now when she talks about the value of wetlands for flood overflow areas. Certainly that has come home to us in the tragedies that are taking place in the middle of our country right now.

You say, "Protection of the functions of our aquatic ecosystems such as pollution control, fisheries, and wildlife support, floodwater storage, and groundwater recharge have been largely ignored." That's tragically so, and it is coming out increasingly with this terrible situation that is occurring in the middle of our country.

Thank you very much, Mr. Chairman.

Senator GRAHAM. Thank you, Senator Chafee.

We have been joined by the chairman of the Environment and Public Works Committee, Senator Baucus of Montana.

· Senator Baucus?

**OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR
FROM THE STATE OF MONTANA**

Senator BAUCUS. Thank you very much, Mr. Chairman. I have a statement to submit for the record and some questions.

Senator GRAHAM. Your statement will be included in the record. [Senator Baucus' statement follows:]

**STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE OF
MONTANA**

Good morning ladies and gentlemen.

I want to commend Senator Graham for the development of a very informative series of hearings on key issues related to the core programs of the Clean Water Act, including sewage treatment funding, toxic control, and nonpoint pollution control.

Today we look into a range of the very important regional clean water issues. From Boston Harbor to the Gulf of Mexico and from San Diego to the Great Lakes, citizens and local governments are working to clean-up and protect water quality.

I am especially pleased that we will hear from witnesses on the progress of the clean-up of Chesapeake Bay. It is almost impossible to overstate the environmental and ecological importance of the Chesapeake Bay. It is also almost impossible to overstate the seriousness of the threats to the quality of the Bay.

The Chesapeake Bay program has been a valuable model for the development of regional water quality initiatives. I look forward to hearing from our witnesses on the successes and any failures of the Bay program to date and any suggestions of lessons learned from this effort.

Efforts to protect Chesapeake Bay lead directly to the National Estuary Program and the many successful projects to protect these vital coastal waters. We need to continue the National Estuary Program and expand existing authorities of the Act to protect coastal waters and I look forward to hearing the ideas of witnesses in this area.

I know first hand how valuable to focused effort to protect an impaired or threatened waterbody can be. In my home State of Montana, we have made substantial progress in protecting the Clark Fork River and Lake Pend Oreille. Our clean water reauthorization must build on these constructive regional projects.

I am also pleased that we will be learning more about the single most outstanding freshwater resource in the world—the Great Lakes. While we have clearly made progress in improving water quality in the lakes, we have a very long way to go. This effort is complicated by the special problem of persistent and bioaccumulative toxics in the lakes.

We will also be hearing suggestions on steps to expand protection of freshwater lakes around the country. Lakes provide an exceptional recreational resource for millions of Americans. I have many fond memories of times spent on Flathead Lake in my home State of Montana. I hope that our clean water legislation can expand and strengthen our clean lake program.

Thank you, Mr. Chairman.

Senator BAUCUS. I would just like to ask Mr. Wedepohl about water quality standards in lakes. I assume it is your view that we need to develop one?

Mr. WEDEPOHL. Absolutely.

Senator BAUCUS. In addition to rivers and streams and so forth, could you just expand on that point, please?

Mr. WEDEPOHL. Absolutely. This is an issue that our organization worked on for almost the last ten years because we became so frustrated with the lack of water quality standards for lakes. How do you tell if you have problems or not if you don't have clear standards? What should we be expecting in this lake?

How do you give 305(b) reports any credibility if you don't have any standards or criteria on which to base them on? How do you control stormwater runoff? How do you deal with new development

and set limits on such? How do you do TMDLs if you don't have criteria or standards to base them on?

That's absolutely essential. You need water quality standards for lakes. They haven't been developed yet because most of our problems have been with point sources going to streams.

We need them. They have to be done.

Senator BAUCUS. If we have water quality standards for lakes because we have been dealing with point sources, then how do we begin to develop water quality standards for lakes?

Mr. WEDEPOHL. A lot of the work has been done already. I think, again, Senator Mitchell's bill has done a great job of structuring this. You classify lakes—for instance, a favorite lake of yours, Flathead Lake, is exceptionally high water quality and is classified as a multi-recreation water body. It is certainly an outstanding water resource.

Once you have that initial classification, some wildlife lakes, for instances, are more naturally eutrophic and have more nutrients in them and that is fine.

You classify lakes by their use initially, and then you take a look at the achievability, i.e., what are the background conditions? What was this lake like before we started doing all these nasty things to it? And you take a look at what that condition was like, and then you end up setting an objective standard on what that lake can achieve, whether it be for phosphorus in a lot of our lakes in the midwest, or nitrogen in lakes in your area.

Senator BAUCUS. I agree. This is Flathead Lake that Mr. Wedepohl is talking about. It is the largest natural freshwater body west of the Mississippi. It is potable.

Senator GRAHAM. It's near Kalispell?

Senator BAUCUS. That's right. You were there recently. That's right. It is about 45 miles long, and it is about 7 or 8 miles wide, and it is a wonderful lake.

Senator GRAHAM. I will certify it is a beautiful lake, and for the remaining weeks of the summer that's not a bad place to be.

Senator BAUCUS. And I will be there. As soon as we get budget reconciliation passed that's where I'm going to be.

Thank you very much.

Senator GRAHAM. Ms. Martin, I would like to ask you the same question that I asked Mr. Wedepohl, except in relationship to the estuarine program. Using a specific example of the problems that led to the establishment of this program, how effective has the program been in ameliorating those problems?

Ms. MARTIN. I, too, would like to say that I think the program has been extremely effective. It has taken time to develop and get to the stage that we are at now.

I worked most closely with the 17 estuaries that have been on line for a few years with the program directors from each of those estuaries and the environmental representatives that sit on the citizens advisory committees in several of those States. I think Long Island Sound is a good example.

You can hear people talking in complete disbelief about how years have gone by when citizens have tried to get both States—Connecticut and New York—to talk to one another, and it was literally impossible until the national estuaries program came into

being, and now they are working together and have just recently submitted their comprehensive management plan for approval into EPA and is in the process, and so soon that will be underway.

The citizen advisory committees—I give the example of the Santa Monica area, which has gotten people who didn't even realize that the Santa Monica Bay was actually an estuary, and through the restoration project there they have held many conferences and workshops, and they've got people understanding the difference between point and nonpoint source pollution, and people advocating, and actually individual citizens paying to have their own public service announcements aired to educate people about what they put in their drains ends up in their local bay.

Some of the problems that—the program isn't great now, and that's why we have been working so closely with Senator Lieberman to straighten up some of the provisions that we think would really make the program a lot stronger.

In particular, those are increasing the role of the EPA, like I mentioned. There has been a lot of inconsistency in the staffing level and the involvement of EPA and different offices, and in that case some offices are able to function much more efficiently than others just because of the sheer lack of resources.

There needs to be more citizen involvement from those programs in Puget Sound, for example, and, like I mentioned, in Long Island Sound—places where they have had successful programs. They are starting to talk amongst each other, and we have been able to provide an opportunity for them to do that. We had a conference in Puget Sound last year to bring program directors together so they could provide a technical support network for one another.

So I guess there are a lot of different examples I can mention about the strengths and the weaknesses, but just to say it is an ongoing process that I think is important to strengthen and to work with, because it shows a great likelihood of success in the end.

Senator GRAHAM. I only have a few moments left in my time, and then at the conclusion of this I see Senator Sarbanes has joined us. I'd like to call on him for his statement, and then we'll return to panel one.

We have also been joined by Senator Lieberman, who has been referred to in glowing terms by virtually all of the members of panel one, and those who have not referred to you are anticipating the chance to do so as quickly as possible.

Senator LIEBERMAN. Perhaps I should remain silent.

Senator GRAHAM. After Senator Sarbanes, I will call on Senator Lieberman for any comments or questions that he might have.

Senator LIEBERMAN. Thank you.

Senator GRAHAM. But let me use my remaining moments to ask this question.

There has been some concern about both the estuarine program and the lakes program having a major and appropriate emphasis on research and understanding, but is there an adequate link to implementation to those steps that will then be necessary in order to put that research to most effective purpose in terms of accomplishing the objective?

Any comments that you might have, as briefly as possible, on the implementation aspects of these two programs?

Ms. MARTIN. That's what we would classify as the key problem with the current program, that there isn't the strong mandate to enforce implementation. Senator Lieberman's bill does do that, and that's what we would recommend happen.

Mr. WEDEPOHL. From the lakes' end, the Clean Lakes Program has worked exceptionally well. The scientists and lake citizens—the citizens find these scientists, and it has gone very well although there are a lot of weaknesses. The initial start-up research kind of faded away as we got into acid rain and a lot of other issues. Some of these good researchers have moved on. I think it is time to come back again.

Senator GRAHAM. Mr. Brinsko, I'm going to have a couple of questions for you, but there will be an interlude here as we call on Senator Paul Sarbanes, a United States Senator from the State of Maryland, to share with us his thoughts on any issues relative to the Clean Water Act, but particularly the Chesapeake Bay.

Senator Sarbanes?

**STATEMENT OF HON. PAUL S. SARBANES, U.S. SENATOR FROM
THE STATE OF MARYLAND**

Senator SARBANES. Mr. Chairman, thank you very much. These are difficult days right now, and I appreciate the opportunity to make my statement.

You will be hearing later Mr. Will Baker, the President of the Chesapeake Bay Foundation, Jeffery Coy is Chairman of the Chesapeake Bay Commission and Member of the Pennsylvania House of Representatives, and Caren Glotfelty is from the Pennsylvania Department of Environmental resources.

I have a long, comprehensive statement that I'd like to submit for the record.

Senator BAUCUS. No. We want to hear every word.

Senator GRAHAM. But in case you feel restrained, Senator Sarbanes, be assured that your total record will be part of the official record.

Senator SARBANES. I think we'd better put it to a vote of the committee, Senator Baucus.

I'll just do a quick summary of it.

I appreciate this opportunity to testify on the clean water reauthorization, and specifically the Chesapeake Bay restoration program.

I commend the committee for moving so expeditiously to reauthorize and strengthen the Clean Water Act, a fundamental building block to our national effort to clean up the Nation's waterways, and particularly important to us in Maryland to restore the water quality and the living resources of the Chesapeake Bay.

Reauthorization of this act, with continued funding for State sewage treatment revolving funds, new initiatives to address non-point source and toxic pollution, and to develop effective watershed programs are, among other issues, absolutely essential.

The Chesapeake Bay was recently featured in the cover story of the National Geographic. It is called, "Hanging in the Balance: Chesapeake Bay."

Now, Will Baker from the Foundation—just to show how effective he is—has brought half a dozen or more copies in order to furnish one to each member of the subcommittee. That's why he is so effective in fighting for the Chesapeake Bay. We commend that article to you.

It says we are fighting hard now to restore this great natural resource to its essential health. This committee has an important opportunity to help tip the balance in favor of restoration by including the Chesapeake Bay Restoration Act, which the six Senators from the Chesapeake Bay area—the two from Pennsylvania, the two from Maryland, and the two from Virginia—have all joined together in cosponsoring in this Congress, as we earlier had done in past Congresses when we had the precursor to this legislation included in the previous Clean Water Act.

This year marks the tenth anniversary of the signing of the first Chesapeake Bay agreement, which brought the Federal Government, Maryland, Virginia, Pennsylvania, and the District of Columbia into an arrangement to work together to restore the bay.

We have made substantial progress over this decade, and the cooperative Federal, State, and interstate management structure established by the program has provided a framework, not only for the restoration of the bay, but it has also been a model for other estuaries around the country. We had long discussions recently with Senator Chafee about Narragansett Bay, and the west coast people up in Puget Sound have also been very much involved. We have heard about efforts on Long Island Sound.

The bay program has pioneered pollution prevention techniques, many of these applied at the State level—this has really energized the State government—such as phosphate controls, bans on toxic boat paint, nutrient management efforts, programs to reduce pesticide use on crop land.

With the signing of the Chesapeake Bay agreement in 1987 and the 1992 amendments, a comprehensive set of goals was adopted, and we have undertaken an ambitious program to achieve improved water quality and living resources productivity including reducing by 40 percent the nutrients by the year 2000.

The level of public support and the degree of cooperation and coordination among all parties have been unparalleled. The Federal role through all of this has been crucial. In fact, the Federal Government has served as the glue that holds the thing together and the catalyst that moves it forward.

We are showing demonstrable results—reduction in phosphorus discharges. The bay industry and sewage treatment plants lead the Nation in compliance with pollution discharge requirements. Submerged aquatic vegetation is making a comeback.

The authorization this committee gave us for the bay program in the 1987 Water Quality Act has been a successful endeavor.

We have made great progress, but we still face some very tough problems. Runoff from farms, in city streets, toxic chemicals, pollution growth and development, putting enormous pressure—many of the bay's living resources and the habitat which supports them are in decline.

We are asking you to include the Chesapeake Bay Restoration Act in this Clean Water Act. It builds on the previous program.

It includes new Federal initiatives to improve cooperation and coordination among the Federal agencies.

It has provisions to have better compliance by Federal facilities. We have a large number of Federal facilities around the bay.

It establishes a new program to encourage citizen and private sector stewardship of the bay watershed. It is very important.

We have a very good program working, and you'll hear more about it from the people who are going to testify in the panel.

It provides support to State and local governments in terms of collecting and analyzing information so better land use management decisions can be made.

It authorizes a habitat restoration demonstration program, provides funding to assist in implementing toxic reductions, pollution prevention, and management actions.

I understand that the administration looks kindly or favorably on these proposals.

This Restoration Act was developed in consultation and cooperation with the States, with the private groups. It has the strong support of the Chesapeake Bay Commission, the Foundation, and the congressional delegation from the region. I mentioned the six Senators. There is also a group in the House of Representatives that is strongly supportive of it.

I have a number of letters from organizations in support of the legislation that I ask appear in the hearing record following my statement.

Senator GRAHAM. Without objection.

Senator SARBANES. Mr. Chairman, we think this is a very important initiative. We think your previous response has produced very constructive results, and we very much urge its incorporation into your reauthorization of the Clean Water Act. This legislation is co-sponsored and strongly supported by my colleague, Senator Mikulski, by the two Pennsylvania Senators, Senators Wofford and Specter, and by the two Virginia Senators, Senators Warner and Robb.

We used to fight about the bay. We used to have shooting wars between Maryland and Virginia about the bay and drawing on its resources. Fortunately, we have passed well beyond that stage and we are now working together. We hope the committee will continue to provide us some glue and some catalyst at the same time.

Thank you very much.

Senator GRAHAM. Thank you very much, Senator, for a very excellent and encouraging statement about what has occurred in the Chesapeake Bay.

Are there any questions by members of the committee for Senator Sarbanes?

Senator BAUCUS. Yes, Mr. Chairman.

I want to thank you very much for your efforts. I have been very impressed, with the Senators of States involved with the Chesapeake Bay program, beginning with Senator Mathias. I think Senator Mathias took the lead, and everyone associated with the Chesapeake Bay owes a great debt of gratitude to him and to you and Senator Mikulski and other Senators for following the same tradition as Senator Mathias.

I might say that the same compliments go to Will Baker. I was very impressed with him when he testified before this committee.

It is not an exaggeration to say that he is one of the more impressive witnesses who have ever appeared before this committee. I can see why the bay program is doing well. It is not only your leadership—yours and Senator Mikulski—but also the very excellent work of Will Baker and his associates.

Senator SARBANES. I appreciate those remarks, and the citizen participation in the bay cleanup is very impressive. The Chesapeake Foundation, which Will heads up, has played the primary role in helping to engender that.

I must say we have gotten wonderful response at the State level, both from the Governors and the State Legislatures, which are reflected in the Commission. We are very appreciative of the interest of Pennsylvania on this problem because it sort of washes down to us. It doesn't impact in the same way there that it does in Maryland and Virginia, but they have been responsive to the challenge, and we are very grateful.

Senator BAUCUS. That's nonpoint pollution in Pennsylvania; is that correct?

Senator SARBANES. That's right. Well, a lot of it is agricultural runoff, and they've gotten the farm community there and in Maryland and Virginia to cooperate in this effort.

A real education process has taken place. First of all, we have brought together parties that used to fight, and the Federal role there has been critical in doing that. There has been a wonderful educational effort that really has people sensitized to cleaning up the bay.

We have storm drains all over the State of Maryland now that say, "Whatever goes here ends up in the Chesapeake Bay" to sensitize people in terms of what they are doing.

Senator BAUCUS. I think you are all doing a very good job.

Senator SARBANES. Thank you.

Senator CHAFEE. Mr. Chairman?

Senator GRAHAM. Senator Chafee?

Senator CHAFEE. I'd like to join in those comments.

I recall when we started this, Senator Mathias, and then Mayor Schaefer, which is going back a few years, and, of course, Senator Sarbanes has been deeply involved with this right from the beginning and giving it a lot of leadership. I think it is terribly important to have the political leaders involved and caring, not that the private citizens aren't terribly important. It has to be everybody.

But I have noticed that, as Senator Sarbanes has pointed out, he has been deeply involved. Senator Mikulski has, Senator Warner, who sits on this committee, Senator Robb, Senator Specter, and Senator Wofford, who also sits on the committee—all of them have had a big role.

As Senator Sarbanes pointed out, whether it is glue or catalyst, the Federal role is so important, and the Federal role is in for a relatively modest amount. I don't want to get hardened, but \$21 million which went to the Chesapeake Bay last year is not a mammoth amount, but it was—I think Mr. Baker later will testify, as I'm sure Senator Sarbanes will indicate, that that's the kind of essential element. Absent that, it is really hard to get everybody to pull together.

I appreciate your taking the time to be with us.

Senator **SARBANES**. I do want to underscore the really critical role Senator Mathias played in all of this. You are absolutely right. He early on saw the problem and he began to put together the support that was necessary to focus the attention on it, and we are really trying to carry forward the banner that he left us when he left the Senate.

It has been a marvelous effort in the sense of bringing people together to deal with a problem and having them all look forward instead of fighting amongst themselves.

I am very appreciative to Senator Warner, who I see has now joined us, for his very strong support. This has really been a very bipartisan effort from the very beginning.

Senator **WARNER**. I would say the most bipartisan I've encountered in the 14 years I have been privileged to serve here. And, indeed, it was Senator Mathias that had the vision, but you and others joined in, and the governors of our respective States.

It is a far cry from the oyster wars we had at the turn of the century.

Senator **GRAHAM**. Senator Lieberman?

Senator **LIEBERMAN**. Mr. Chairman, I just want to thank Senator Sarbanes for his statement and just to stress what I think is the strength of the point he makes about the connecting that is going on here and the interstate connecting because of the greater awareness that we have that we are really talking about ecosystems here and broader watersheds.

We had a fascinating experience Sunday in Connecticut on this point when Secretary Babbitt came in and the Fish and Wildlife Foundation nationally announced that they were acquiring salmon fishing rights off Greenland as a way to assist in returning the salmon to the Connecticut River.

Here these salmon had started in Canada, go through New England down through the river, out through the sound out to the Atlantic Ocean, and then up to Greenland. We see the way, particularly through the waters, that we are all connected.

As Senator Sarbanes said, what happens in Pennsylvania affects the Chesapeake Bay, which brings me back to this point: the emphasis in the legislation that Senators Baucus and Chafee have introduced, which is reflected also in S. 815 that I have introduced, on watershed planning and rewarding those who do watershed planning with financial assistance to help make it possible is critically important, and it is a recognition of reality that Senator Sarbanes I think has quite eloquently pointed to.

Thank you.

Senator **SARBANES**. Let me make one final point.

The Susquehanna is a major tributary into the bay. The Susquehanna begins in Cooperstown, New York, and it comes out of Lake Otsego. If you go to the Baseball Hall of Fame, you make that sort of pilgrimage, right there in Cooperstown, down the street a little way—I went to look at it—is where this stream starts down then broadens out and becomes the Susquehanna and eventually flows south. It is no wider than right across here at that point.

Senator **GRAHAM**. Senator Sarbanes, thank you very much for your very helpful statement today and the leadership which you and all of the people that you have been generous enough to recog-

nize have given not only the Chesapeake Bay, but also as an example of what similar efforts can mean to other endangered water bodies across America.

Thank you.

Senator SARBANES. Thank you very much.

**OPENING STATEMENT OF HON. JOHN W. WARNER, U.S. SENATOR
FROM THE COMMONWEALTH OF VIRGINIA**

Senator WARNER. Mr. Chairman, I join in that. To show my respect for my good friend and colleague, his statement will be the one today. I will put mine in the record.

[Senator Warner's statement follows:]

**STATEMENT OF HON. JOHN W. WARNER, U.S. SENATOR FROM THE
COMMONWEALTH OF VIRGINIA**

Mr. Chairman, and other members of the Committee, I am very pleased that the Subcommittee will hear testimony today on the Chesapeake Bay program, and particularly on legislation which I am pleased to cosponsor S. 567, the Chesapeake Bay Restoration Act.

This year is the tenth anniversary of the signing of the first Chesapeake Bay Agreement—a successful, cooperative effort at watershed planning and restoration of the entire Bay area agreed to by Virginia, Maryland, Pennsylvania, the District of Columbia, the Environmental Protection Agency, and a tri-State legislative body, the Chesapeake Bay Commission.

Now is the appropriate time to assess the progress we have made over the past decade, and more importantly, to examine the daunting tasks which lie ahead.

Mr. Chairman, let me state clearly that I hope that the full text of s. 567 will be included in the Clean Water reauthorization bill when it is ready for Committee mark-up.

Let me emphasize also that a significant amount of effort has been invested in drafting the Chesapeake Bay Restoration Act. This legislation is the result of over two years work by our States, members of the Chesapeake Bay Commission, the Chesapeake Bay Foundation and Bay state legislators.

This legislation takes major steps in moving the program forward while keeping faith with the principles which have kept the jurisdictions steadfastly united in the common goal of restoring the Bay. First, the bill contains the flexibility necessary for States to respond to new and changing research information on the health of the Bay. Second, this bill continues to foster the strong and essential partnership between the Federal government and the States, and perhaps more critical, between the states themselves.

Mr. Chairman, in 1979, when I first joined our distinguished former colleague, Senator Mathias from Maryland, in this commitment to bring together significant state and federal resources to "save" the Bay, it became clear that information on the problems afflicting the Bay was sorely lacking.

Much of the effort in the early years focused on defining the Bay's problems. We have known for some time that excessive nitrogen when decomposed depletes oxygen causing "dead" areas in the Bay, that the Bay was plagued with toxic hot spots, and that the return of underwater by grasses and living resources would be key indicators in our efforts to restore the Bay.

Mr. Chairman, what I have learned from being associated with this program for over ten years is to never think we know all the answers to what it will take to keep the Chesapeake one of America's greatest treasures.

I only have to look at the Chesapeake Bay Commission's 1992 Annual Report which discusses the efforts to control nutrient loadings. It states, "While reductions in phosphorus are well underway, nitrogen levels in the Bay have remained almost unchanged since 1985, the baseline year for the 40 percent reduction. . . . In short, the nutrient we need to worry about most (nitrogen) is the one which, until now, received the least attention."

This information led the Bay states to redouble our efforts to meet the commitments made in the 1987 Chesapeake Bay Agreement to achieve a 40 percent reduction in nutrient loads by the year 2000. In 1992, the Chesapeake Executive Council amended the 1987 Agreement to focus the nutrient reduction strategy on a tributary by tributary basis.

While the Bay Program continues to evolve as we move into a new stage of making some very difficult decisions, I believe it can truly serve as a model for the management of our nations' other estuaries.

The Bay Program's cooperative structure has been successful in fostering commitments from divergent political entities and citizen groups. The Bay Program leads the nation in nonpoint source pollution control, nitrogen removal technologies, estuarine modeling efforts, and sediment and erosion control initiatives. It has pioneered beneficial uses of dredged materials and has initiated several model land use programs.

Mr. Chairman, during the August recess I will be holding a series of meetings with state officials, representatives of agriculture and industry and members of the environmental community, including the Chesapeake Bay Foundation who has joined us today, to discuss the watershed management and nonpoint provisions of S. 1114. I look forward to sharing their thoughts with you as the Committee prepares to markup this bill later this year.

Senator GRAHAM. Thank you very much.

Senator Warner, we interrupted the first panel in order to hear from Senator Sarbanes.

Senator WARNER. I understand.

Senator GRAHAM. We have a few more questions for the first panel. It is now Senator Lieberman's turn to ask questions.

Senator Warner, if you have any questions I will call on you next.

Senator WARNER. Thank you.

Senator GRAHAM. Senator Lieberman?

Senator LIEBERMAN. Thank you, Mr. Chairman.

I will try to be brief.

I wanted to thank Ms. Martin for her kind words about S. 815. We have been delighted to work with your organization in putting it together. And, responding to the chairman's broad statement, to thank anyone else who has or will say kind things about S. 815 in the course of the morning.

I, in a way, have begun my statement by what I said in response to Senator Sarbanes but, just to ask you, Ms. Martin, if you could talk a little bit about two things.

First, is the way in which very broad—we're talking here a lot about inter-relatedness, and just talked about the natural inter-relatedness of ecosystems or watersheds.

One of the things that struck me in Connecticut—it's reflected in the person of John Atkin on the next panel—is the conceptual breakthroughs, the psychological breakthroughs that have occurred in the very broad coalitions that are now forming to protect estuaries.

I wanted to ask you whether in this case we have labor, management, environmentalists, contractors all seeing the significance of cleaning up the sound. Is that happening nationally?

Ms. MARTIN. Without a doubt. It has been very exciting for me. Since I have started working American Oceans Campaign about four years ago I started working on this piece of legislation, and there was no other environmental group that I knew of really on a national level doing this.

Since in the last couple of years, I have a mailing list of now over 300 national groups, and just countless local groups that are wanting to work on this bill.

I think part of it has to do with the fact that Congress has acknowledged the role—and the very important role—that citizens

can play. Finally, they feel as if someone is really listening to them. They can participate in the management conferences and the citizen advisory committees, and they feel like they get something for their money or for their time at the end of the process because they see some progress.

The coalition effort I think has been important both with the labor and the industry and the Clean Water Jobs Coalition on the funding element of it, but also on just the program strengthening provisions that your bill also focuses on.

We have a whole new realm of industrial types of interest joining our coalition now, too, from recreational users and sporting magazines and scuba divers and those types of people to realizing that all of their business depended on healthy waterways, and particularly the estuaries.

Senator LIEBERMAN. Let me ask you one final question. I appreciate that answer. It is encouraging.

The nitty-gritty, if you will, is money. We have seen estimates of what it would take to clean up Long Island Sound which, of course, we believe—and I hope people nationally begin to believe—is an estuary of significance that really does compare to the Chesapeake Bay and Great Lakes. We have seen estimates that go from \$6 billion to \$26 billion to clean up the sources of pollution, to clean up the sound. That involves New York, Connecticut, and, to some extent, Rhode Island.

My bill, and I believe the Baucus-Chafee legislation also includes a funding for the State revolving funds to support infrastructure changes—in our case up to \$5 billion annually. How significant is that, do you think, to dealing effectively with the kinds of problems we are talking about here?

Ms. MARTIN. Being a Washington kind of inside-the-beltway lobbyist, I very often get slapped around by my friends out there in the field for saying that \$5 billion is what we are advocating for, because they say that really is a drop in the bucket compared to the needs. As you said, implementing just the sediment provisions in the Puget Sound Watershed comprehensive management plan is upward of \$20 billion.

So \$5 billion for the whole Nation is really insignificant, but when that can be leveraged with the types of means that are being worked on and developed in the local estuary programs, the money can go much farther than it appears on the surface.

I think your bill also highlights some of those things, and we want to continue to educate other estuary programs and other watershed management models on how to make the most efficient use of their funds. And, of course, to include the local people you have to include local dollars and State dollars to keep their interest involved in it. We think that's an important provision.

Senator LIEBERMAN. Thank you, Ms. Martin. And thank you, Mr. Chairman.

Senator GRAHAM. Senator Warner?

Senator WARNER. Mr. Chairman, I'm going to pass, and reserve my time for the next panel. Thank you.

Senator GRAHAM. Mr. Brinsko, I don't want you to feel as if your remarks were not heard. You are essentially laying out a new chal-

lenge, while your two colleagues were discussing the effects of our efforts to deal with issues that are currently underway.

From your statement, I infer that you feel that the current Clean Water Act does not contain sufficient flexibility in the administrator to deal with some of the unusual circumstances that are a consequence of the peculiar climate and meteorology of the arid west. Is that correct?

Mr. BRINSKO. Mr. Chairman, that is correct. Early in my presentation I made note of my former home city, Pittsburgh. I spent 50 years there. Listening to your conversations here on wet ecosystems brough back memories of when I was heavily involved for 22 years in Pittsburgh.

But coming to the west, I found a different situation. Our problems are unique. When we talk about flexibility—flexibility, unfortunately, is a two-edged sword. It all depends on the interpretation of this flexibility aspect.

Our concerns primarily are that Congress said that all water should be fishable and swimmable, and on the surface that sounds great. But if this group would join me in Tucson today, and if anybody is a golfer, we have a 60-mile lineal sand trap that runs from one county border to another. To make this fishable and swimmable is rather difficult because we just don't have the water there. It is a dry river.

Our problem is that we are faced with these standards that are inappropriate for our kinds of waterways. Even though they are listed as navigable waters, we just don't have the water in it. The only water that we have there is the effluent discharge from the wastewater system and periodic rainstorms. Effluent discharges form a riparian habitat, but aren't adequate or sufficient to maintain anything beyond that.

What we need is for Congress to establish a section in the law which recognizes the need to develop proper water quality criteria documents and water quality standards based on appropriate scientific research for our part of the country: the arid west.

What we are looking for, basically, is to level the playing field. I'm sitting here listening to what is going on in the Chesapeake Bay area, which is great. The Great Lakes area is also an important area because I came from Pennsylvania and I understand what is going on there. But to equate those standards and the standards that were developed in previous years in the wet ecosystems and move them out into the west, and using a translator to say, "okay, these are your standards," it just doesn't work.

We feel it is a very appropriate request to say, "Let's get some research. Let's get some science into the west. Let's find out what we have to protect there, and let's protect it."

However under current policies, it is a crap shoot. Some of you could say that we are looking for some leniency in standards. That is not true, because the studies could very well indicate that we have to take out more of the pollutants.

But it also may show it is not necessary to take out some of these pollutants. Ammonia is an illustration. I had a five-year—let's call a spade a spade—a five-year battle with the EPA back seven years ago. One of EPA's requirements was to take out ammonia from effluent discharges. We went through an extensive process and litiga-

tion and so forth to be able to substantiate why it was not necessary to take out ammonia.

However, if the agency—the regulatory agency—would have prevailed, I would have had to have spent approximately \$118 million of our ratepayers' funds to be able to retrofit the treatment facilities. The bottom line is that there were no net environmental benefits. The community would have to have had an increase of their rates by a 45 percent factor.

So when we start talking about the west, the issues in the west, the problems we have, the flexibility, it is very important to us.

This is why, in my presentation, I request that there be a research program to be able to address not just the problems in a specific area but the problems of the entire arid west. If you look at the map in our submit all, you will find there are 17 western States. Portions of those States have 15 inches of rainfall or less.

I'm not just talking about Tucson, Arizona, or Arizona; I am talking about the 17 western States that need the consideration, need to be able to develop proper criteria documents for our part of the country.

We need it because money is scarce. We don't have the money just to waste in an area where really the money could be utilized some place else.

Senator GRAHAM. Thank you very much, Mr. Brinsko.

Are there any other questions of Mr. Brinsko or other members of this panel?

Senator BAUCUS. I just want to say he makes a good point with respect to the aridity in the west. I think it is important to remind all of us here that west of the 100th meridian it doesn't rain. The average annual precipitation—I don't know about your State, but in the State of Montana it is about 14 inches. That's in the lowlands—not in the top of the mountains where the snow accumulates, but the average annual precipitation is about 14 or 15 inches. Back here in Washington it must be around 45 inches at least.

Mr. BRINSKO. But the eastern parts of Washington are very dry.

Senator BAUCUS. I'm talking about Washington, D.C. I would guess—

Mr. BRINSKO. I think there are about 100 inches out there right now, sir.

Senator BAUCUS. And it is the lack of precipitation which is the single most defined criteria of the west—and also because they are interior States. That explains why the population density is so low—just because it doesn't rain, there is no water, and because they are non-coastal States. I think about 50 percent of our country's population is within 50 or 75 miles of a coast. The rest is interior. If you look at the rest that is interior, it is distributed basically according to where it rains, where there is rainfall.

You make some very good points, and I think it behooves all of us to listen very seriously to what you are saying because there is a lot of truth in what you are saying.

Mr. BRINSKO. Senator, thank you.

Senator CHAFEE. I want to join in that, Mr. Chairman. I think Mr. Brinsko has brought before us something that we normally don't deal with before this committee—an area of the country where you have a river with no water in it. As Mr. Brinsko pointed

out, he formerly came from Pennsylvania where a river was a river. Most of us in this committee are familiar with those situations. We are not familiar with the situation, as he pointed out, in the Santa Cruz River where you can walk across and not even get damp.

Mr. BRINSKO. Mr. Chairman, just as one comment, when I talk about 17 western States, we are talking about approximately 378,000 square miles of land.

Senator BAUCUS. That's right. I reminded Senator Lautenberg of the different population densities. The population density in the State of New Jersey is over 1,000 people per square mile. The density in the State of Montana is about five.

Senator GRAHAM. If there are no further questions, we have been joined by Senator Wofford.

Senator Wofford, did you have any questions of this first panel.

Senator WOFFORD. Not right now, Mr. Chairman.

Senator GRAHAM. If there are no further questions, again I want to thank this panel. You have underscored the fact that, while we are dealing with a national Clean Water Act, within that act there must be sensitivity to the full range of special circumstances which you have so effectively described. That will be clear in our mind and one of our major objectives.

Thank you very much.

If panel three could please come forward, I will introduce you as you are taking your seats.

Mr. George Coling, Washington Great Lakes Representative of the Sierra Club; Mr. William Baker, who has already been lauded, is President of the Chesapeake Bay Foundation; the Honorable Jeffrey Coy, Chairman of the Chesapeake Bay Commission and a member of the Pennsylvania House of Representatives; Ms. Caren Glotfelty, Pennsylvania Department of Environmental Resources; Mr. John Atkin, Clean Water Jobs Coalition; and Mr. Paul Hansen, Director, Midwest Regional Office, Izaak Walton League of America.

Senator Wofford, do you have an opening statement for panel three?

OPENING STATEMENT OF HON. HARRIS WOFFORD, U.S. SENATOR FROM THE STATE OF PENNSYLVANIA

Senator WOFFORD. Yes, Mr. Chairman.

This year is the tenth anniversary of the signing of the Chesapeake Bay agreement. That landmark accord marked the beginning of Federal and State cooperation to improve one of our national treasures.

Much has been done during this past decade. Phosphorus levels, a leading cause of aquatic life destruction, have been reduced; nitrogen levels have stabilized; toxic releases and emissions have been dramatically reduced; many plant and animal species are making a comeback. Yet, there is lot more to be done.

Pennsylvania supplies 50 percent of the fresh water to the Chesapeake. I'm glad that Pennsylvania recently has taken the lead in stabilizing and improving the bay.

Our new Act Six creates the Nation's first comprehensive nutrient management program to reduce agricultural runoff through proper planning and practices. Cooperation will be key to implementing this new environmental strategy.

Today we have from the Pennsylvania team on this panel two witnesses here who are vital to the creation and implementation of that Act Six.

Jeff Coy—we are very happy to see you here, Jeff—was a key player in our Legislature in bringing about consensus among diverse environmental, agricultural, and business groups. We are proud that he serves as Chair of the Chesapeake Bay Commission.

Caren Glotfelty—greetings, Caren—is Deputy Secretary of the Pennsylvania Department of Environmental Resources for Water Management, too was key in creating new approaches for Chesapeake Bay protection.

I welcome them here today, and salute also the other members of the panel. I look forward to hearing all of you and to working with my colleagues like Senator Warner on this Commission and Senator Sarbanes, who has introduced legislation on behalf of several of us to improve the quality of the Chesapeake.

Thank you, Mr. Chairman.

Senator GRAHAM. Thank you very much, Senator.

I would apologize in advance to members of this panel. I have a note that we might be called shortly for a vote, so it is possible that there will be an interruption during the course of your opening statements.

I will call on the members of this panel in the order in which they were recognized, again asking if you could be as concise as possible. Your full statements will be part of the record.

Mr. George Coling?

**STATEMENT OF GEORGE COLING, GREAT LAKES SPECIALIST,
THE SIERRA CLUB, WASHINGTON, D.C.**

Mr. COLING. Hello. I am George Coling, the Sierra Club's Great Lakes Specialist, based here in Washington. I am testifying today on behalf of the Sierra Club, the Lake Michigan Federation, Citizens for a Better Environment, Great Lakes United, Coast Alliance, the Contaminated Sediments Work Group, and Lake Superior Alliance.

It is my pleasure today to voice strong support of these organizations for the Great Lakes Clean Water Amendments Act of 1993, that's S. 1183. We want to thank particularly Senators Metzbaum and Glenn and the other cosponsors of the bill for their continued leadership in cleaning up the Great Lakes which is, of course, the largest freshwater ecosystem in the world.

I wish to emphasize that the organizations for which I am testifying view this bill as an integral part of a comprehensive national plan for cleaning up contaminated sediments. The same organizations testified on that subject about a month ago, and we see the S. 1183 approach as complementing that testimony.

Changes in the toxics section of the Clean Water Act—and, again, we submitted testimony about a month ago on that. Could prevent toxic buildups in the Great Lakes and elsewhere.

Certainly the Baucus/Chafee Act of 1993, S. 1114, is a very promising start for clean water authorization, and we urge the subcommittee to meld the S. 1183 Great Lakes bill into the main vehicle for reauthorization.

I have a couple of comments on what I am calling in my testimony "Toxic Harbors: The Great Lakes Plague." Throughout the Great Lakes, contaminated sediments plague the use of our harbors and waterways. Water use in 42 of 43 Great Lakes Areas of Concern—these are toxic hot spots that have been identified by the International Joint Commission of Canadian and U.S. Representatives—are impaired by the buildup of toxic muck. That's 42 out of 43 in both countries.

Evidence on the ill effects of sediments such as PCBs, cadmium, dioxin, and DDT in the water is mounting, and there are severe biotic and human health effects associated with this problem. As an example, sediments account for 75 percent of the PCBs going into Lake Michigan, and they are the main source of fish contamination in that lake.

The sediments are a clear threat not only to the Great Lakes' environment, but also to the Great Lakes' economy. In June the Sierra Club released a study called, "Clean Lakes, Clean Jobs," which documents approximately 2.9 million jobs and \$76 billion of revenue per year are in jeopardy from not cleaning up contaminated sediments in the Great Lakes. This is aggregate data from tourism, fishing, and the shipping industry in the lakes.

For example, tourism is the most threatened industry, and roughly 2.7 million people in the Great Lakes make their living from tourism. There are approximately 89,000 fishing jobs, and more than \$4 billion annually in commercial and sport fishing proceeds in the economy. These are in jeopardy, again, from doing nothing. There are 44,000 shipping jobs which contribute about \$3.5 billion to the Great Lakes' economy each year. That's the scope of the problem.

We do have a success story like the Chesapeake Bay has a success story, and that's called ARCS, the Assessment and Remediation of Contaminated Sediments program, initiated by the 1987 Clean Water Act reauthorization. This program has provided key demonstration programs for cleaning up toxic mucks in five different areas—Buffalo, Ashtabula, Saginaw, Indiana Harbor, and Sheboygan Harbor.

These are so far successful bench-scale pilot projects, and what we need now is a full-scale cleanup of some of these sites and more bench-scale models. That's exactly what the Metzenbaum bill, S. 1183, calls for, and that's why these organizations support it with some specific modifications and additions which I am going to briefly run through.

Senator GRAHAM. Mr. Coling, could you please summarize? Again, your full statement will be made part of the record.

Mr. COLING. I certainly will. Yes. I've just got a couple of quick points.

There modifications include the possibility of adding more full-scale cleanup sites, shortening the time for EPA's completion of the pilot-scale projects by three years, broadening the application of the assessments to include some smaller lakes in the basin, set-

ting a statutory deadline for completion of phase two of EPA's Great Lakes initiative, and, finally, making Lake Superior a world-class pristine water body by stipulating that all of Lake Superior is an Outstanding Natural Resource Water.

Thank you.

Senator GRAHAM. Thank you very much, sir.

Mr. William Baker, President of the Chesapeake Bay Foundation.

STATEMENT OF WILLIAM BAKER, PRESIDENT, CHESAPEAKE BAY FOUNDATION, ANNAPOLIS, MARYLAND

Mr. BAKER. Thank you, Mr. Chairman, members of the committee, and a special thanks to Senator Baucus for those kind words.

I appreciate the opportunity to appear before you today. My name is Will Baker. I'm the President of the Chesapeake Bay Foundation. We have over 87,000 members from all 50 States in the Union and 14 foreign countries.

The Chesapeake Bay is, as Senator Sarbanes said, a worldwide treasure. It is also a national and even international model for the restoration of our coastal waters.

The program to restore the bay is an effort involving the combined activities of Federal, State, and local governments, as well as concerned citizens from all sectors of society.

Just 25 years ago, the Chesapeake Bay produced one-quarter of the Nation's oysters, one-half of all hard crabs—nearly 100 million pounds in a good year—and a staggering 95 percent of all the soft crabs. In addition, nine out of every ten striped bass caught from North Carolina to Maine were born in the Chesapeake.

Today, however, the bay is a far different place. For the first time ever, the Gulf States' total catch of blue crabs has exceeded the Chesapeake.

When the Chesapeake Bay agreement was put in place in 1983, detergents still contained phosphates, the damaging impacts of nitrogen were largely ignored, agricultural programs focused almost exclusively on soil erosion, and Pennsylvania wasn't even a member of the Chesapeake Bay Commission.

We now consider most of those issues routine. We no longer debate whether nitrogen is damaging, only how best to remove it; we can't understand all the fuss about the phosphate detergent ban; and Pennsylvania is a full and complete partner and has most recently taken a leadership role in nutrient runoff from agricultural lands, thanks to legislation sponsored by Representative Jeff Coy.

Our organization strongly supports the Chesapeake Bay Restoration Act of 1993 introduced by Senator Sarbanes and, as he mentioned, with the full support of the entire bay delegation. We are particularly enthusiastic about the new wetlands restoration program, and we are pleased to see the act's focus on the tributary strategies.

This legislation will take us the necessary next step toward true integrated watershed management, an approach pioneered by the Chesapeake Bay Program that is now widely recognized as the only logical way to proceed.

Despite the value of the Restoration Act for the bay, however, it is the language in the rest of the Clean Water Act that can make or break the cleanup.

The act being discussed in this committee, S. 1114, has many features that we support. For instance, it clearly embodies the concept that the most effective way to deal with pollution from toxic substances is to keep them out of the discharges in the first place—what we have been calling “pollution prevention.” It establishes stronger programs to deal with polluted runoff, including mandatory programs for certain areas. And it elevates watershed management to its appropriate position in the Clean Water Act.

The Chesapeake watershed consists of some 64,000 square miles, encompassing six States and the District of Columbia. Although it may sound a bit presumptuous, I would submit that the world is watching us here in the Chesapeake Bay region.

For example, every week our offices are contacted by people from all over the globe. In the past six months, we have hosted visitors from some 20 foreign countries, including Japan, the former Soviet Union, Peru, Brazil, Germany, the Czech Republic, Sweden, and many others.

This November, the Chesapeake Bay will be the centerpiece of the International Conference on Coastal Seas, to be held in Baltimore, Maryland.

We in the region are indeed blazing a trail for the rest of the Nation. I urge you to incorporate the Chesapeake Bay Restoration Act into the amended Clean Water Act, and when you do that, please consider designating the Chesapeake as the Nation’s estuary, for that is truly what it is—a natural resource of singular importance to the country.

Lately, when I am asked how the bay is doing I have said that the patient is stabilized, and that we are poised on the brink of real recovery. This news is encouraging, but I do not mean to minimize the challenges we face. They are, indeed, formidable.

But do we really have any other choice but to address them?

The Chesapeake Bay lies in the heart of this great Nation’s most populated mid-Atlantic region. Washington, D.C., the capital of the world’s last superpower, is both geographically and historically central to the Chesapeake. The 15 million people who live in this watershed have repeatedly and overwhelmingly demonstrated their commitment.

One last thought. We have a model Federal, State, and local partnership at work here. The cooperation is historic. We must set our sights high. We must look to restore, not just maintain, the Chesapeake, for if we here in the United States of American can’t save the Chesapeake Bay, what real hope do we have for the rest of the planet?

Thank you very much.

Senator GRAHAM. Thank you very much, Mr. Baker.

Mr. Jeffrey Coy?

STATEMENT OF HON. JEFFREY COY, PENNSYLVANIA HOUSE OF REPRESENTATIVES, CHAIRMAN, CHESAPEAKE BAY COMMISSION

Mr. Coy. Thank you, Mr. Chairman, Senator Warner, Senator Chafee, Senator Baucus, and my good friend from Pennsylvania, Senator Wofford.

I am Jeff Coy, and I am a State Representative from the Commonwealth of Pennsylvania, and I am serving this year as the Chairman of the Chesapeake Bay Commission.

The Commission is a tri-state legislative advisory commission that was created over a decade ago by the Legislatures of Maryland, Virginia, and Pennsylvania. It serves as a signatory to the 1983 and 1987 Chesapeake Bay agreements, along with the governors of the three States and the mayor of the District of Columbia.

Functioning as the legislative arm of the cleanup effort, it is the Commission's responsibility to work with both the State Legislatures and the Congress on programs to restore the Chesapeake Bay. The Commission also provides an important tri-state perspective for the restoration effort.

I am honored to be here today as its chairman representing my colleagues from Maryland and Virginia, as well as Pennsylvania, and the other members of the Commission, to support the reauthorization of the Clean Water Act, which would include provisions of the Chesapeake Bay Restoration Act, and to emphasize the important role that the Federal Government has as a partner with the States and the District of Columbia in the restoration of the bay.

First I would like to share a few comments concerning the broader picture, the critical importance of the reauthorization of the Clean Water Act.

For almost two decades, the Water Pollution Control Act has been regarded as landmark legislation aimed at improving, protecting, and restoring water quality throughout the Nation. The act has served both as a vehicle for providing financial assistance to the States in areas such as the construction and expansion of wastewater treatment facilities, and as provided by example the incentive or impetus for many of the other water quality programs which have been undertaken at the State levels.

We commend you for your foresight in pursuing the reauthorization and strengthening of this vital legislation. Virtually every element of the Clean Water Act enhances and supplements our efforts to protect and restore the Chesapeake Bay. The act's continued support for sewage treatment plants and controls on toxic pollutants will reap significant benefits, especially in the Chesapeake Bay.

I am particularly pleased to see the nonpoint source pollution control provisions of the act strengthened and reemphasized. We have found, as have other States across the Nation, that control of the runoff of other nonpoint sources is a vexing and expensive problem. I think it is fair to say that we have made real progress in the bay region, but continued emphasis at the Federal level can only help.

While I am sure the committee is aware of the problems facing the Chesapeake Bay, let me briefly review the condition as I see it.

While we have made significant progress, and certainly advances in the last ten years, it is fair to say that we continue to have a long way to go. We have made progress with reductions in nutrient phosphorus entering the bay because of a number of phosphate detergent bans.

Senator Chafee asked earlier if the State of Wisconsin had. Of course, Maryland, Virginia, and Pennsylvania all do.

Improvements of sewage treatment plants and controls on runoff from agricultural and other types of lands are also important.

Improved water quality in many areas has led to slow but steady improvements in the bay's underwater grasses. Striped bass, known in the bay as rockfish, have rebounded.

Many problems remain, however. We continue to have difficulty in controlling excess nitrogen. Although the increase has been slowed, critical habitat such wetlands are still under pressure from this development.

There are good reasons why we have come so far, and there is reason why there is also optimism, I think, for the future.

The current Chesapeake Bay agreement, signed in 1987 and amended in 1992, has provided clear, strong, specific, and comprehensive goals for the multi-jurisdictional Chesapeake Bay program. We have, under the rubric of the Chesapeake Bay program, brought together not only the States, the District, the Commission, and the EPA, but also thousands of citizens, scientists, business leaders, local governments, farmers, and others who work toward common goals.

We have been guided by state-of-the-art research and have used a computer model for the management that is arguably one of the most sophisticated in the world.

We have also not rested on our accomplishments. The participants in the bay program have not been shy about reassessing our commitments in the face of new scientific evidence.

With a watershed that spans multiple States and jurisdictions, success only comes when recognizing that regional differences may apply, and therefore the tools that need to be applied must necessarily meet the needs of the individual areas.

The recognition of the Chesapeake Bay as a resource of national significance and your financial support for this program since 1984 have provided a vital underpinning for the entire effort.

Pennsylvania is blessed—my home State—with a strong agricultural economy. However, excess nutrients produced by agricultural operations have proved to be a very major problem for water quality in the Susquehanna River and ultimately the bay.

Money for the program—some \$12 million since 1987—supplemented—I want you to hear this—supplemented by \$17 million of State tax money in Virginia, Maryland, and Pennsylvania has given us the ability to grant farmers help to install best management practices to build manure storage facilities to help control nutrient runoff.

Earlier this year, the Pennsylvania Legislature, with the support of environmental and agricultural interests, adopted landmark agricultural nutrient management legislation which I introduced on behalf of the Pennsylvania delegation to the Chesapeake Bay Commission. Senator Wofford referred to it earlier, and I firmly believe

that this is part of the success, that this legislation came about from the acceptance of farming practices that were already funded in part by the bay program.

In closing, I cannot only say that I emphasize too strongly the importance of the Chesapeake Bay as the community watches your efforts here, but I believe that you have before you an opportunity to signal to the citizens of the bay region and to the Nation at large your continued commitment to the protection of this Nation's most productive estuary.

The Chesapeake Bay restoration effort is a state-of-the-art experiment in environmental protection which deserves and demands your continued support.

To go a little further with Will Baker's medical analogy, I like to say that the wound has been identified, the tourniquet applied, bleeding stopped, but restoration of health remains quite essential and, I think, equally important.

Thank you.

Senator GRAHAM. Thank you very much, Mr. Coy. And congratulations on the leadership that you have provided.

Mr. COY. Thank you, Senator.

Ms. Caren Glotfelty with the Pennsylvania Department of Environmental Resources?

STATEMENT OF CAREN GLOTFELTY, PENNSYLVANIA DEPARTMENT OF ENVIRONMENTAL RESOURCES

Ms. GLOTFELTY. Thank you Mr. Chairman and members of the committee.

As Deputy Secretary for Water Management in the Pennsylvania Department of Environmental Resources, I am responsible for all water quality and water quantity programs in Pennsylvania, including the Commonwealth's participation in the Chesapeake Bay program.

I appreciate the opportunity to speak to you today on the Clean Water Act reauthorization, and specifically I'd like to touch on some of the lessons that we have learned from our involvement in the Chesapeake Bay program that should be applied elsewhere, and provisions that should be included in the Clean Water Act to ensure the continued success of the Chesapeake Bay program and watershed planning efforts elsewhere.

Although the area in Pennsylvania drained by the Chesapeake Bay occupies only about one-third of the Commonwealth's total land, the Chesapeake Bay program has taken on an importance in Pennsylvania, as it has in the entire country, beyond the geography it directly affects.

In Pennsylvania it has served as a catalyst for many important water quality initiatives that we have taken at the State level. Most recently, as has been referred to before, we have developed landmark agricultural nutrient management legislation under the leadership of Representative Coy.

Initially in Pennsylvania we relied on a voluntary approach to agricultural nutrient management to reduce the phosphorus and nitrogen entering the Susquehanna River and the bay from farms in Pennsylvania. Our Chesapeake Bay program in Pennsylvania

used education, technical outreach, and financial assistance to persuade farmers that nutrient management is not only environmentally responsible, but can be profitable, as well.

Our partnership with agriculture has led this year to the passage of Act Six, which now requires the preparation and implementation of nutrient management plans by high-density livestock farms. This new law was the result of the major farm organizations in Pennsylvania recognizing that nutrient management was essential to the future of agriculture in the commonwealth, and that a voluntary program alone was not sufficient.

Pennsylvania's nutrient management program, while mandatory, is not a traditional regulatory program. It requires the preparation of a plan which takes into account the farmer's crop needs, soil nutrient content, available manure, and farming practices. The site-specific nature of nutrient management planning allows the farmer to integrate appropriate management practices into normal farming operations.

The program will be administered through our country conservation districts, who have been traditional allies to farmers.

I believe that Pennsylvania's example could and should spawn a whole new generation of legislative approaches that rely less on command and control and more on shared goals, education, cooperation, and technical assistance.

The Chesapeake Bay program has shown us that it is important to set tangible, measurable goals on a watershed basis. The notion that the bay could be restored to the water quality of an earlier time through specific numerical reductions in nutrient loadings has had a tremendous effect in capturing and holding the public's attention.

More recently, the program has been able to link water quality restoration to the return of specific amounts of bay grasses and is moving toward the ability to scientifically link water quality improvement to the return of other living resources.

The power of such tangible goals is such that even in Pennsylvania, with no bay shoreline at all, the public has retained its interest in and strengthened its commitment to Chesapeake Bay restoration for more than ten years.

The success of the Chesapeake Bay program is a strong demonstration that integrated watershed planning and management is the direction in which we should be going in all geographic areas. Only through concerted action by all jurisdictions and in all media—air, water, and land—affecting Chesapeake Bay will we be able to make this progress necessary to restore living resources to the bay.

I would like to stress two important principles from the perspective of the States and other jurisdictions involved in the bay program that need to be respected for continued success. These are flexibility and perseverance.

Now, I understand that you have already heard a lot in other hearings about the importance of flexibility. Let me just say that perhaps the most critical factor in the success of the bay program to date has been the flexibility afforded the jurisdictions who are responsible for implementing the program in targeting their financial and other resources to meet the broad bay-wide goals.

Although we are all part of a single watershed, Maryland, Virginia, Pennsylvania, and the District of Columbia are all very different in terms of the impacts we have on the bay, the resources we have available to solve bay problems, and the other priorities we must balance with the needs of Chesapeake Bay.

Perseverance is also critical. We must be able to stick to the course we have set long enough to see success. With the first Chesapeake Bay agreement in 1983, nutrients were identified as the culprit causing the bay's decline in living resources. In 1987, although other environmental goals were set, as well, there was a strong and specific emphasis on nutrient reductions.

Because we have been somewhat single-minded until now, the jurisdictions have largely targeted their Chesapeake Bay resources toward actions necessary to reduce nutrients. With the 1992 agreement, the jurisdictions enlarged their perspective to include the tributaries, but the emphasis has remained on nutrients.

We have made progress. The bay is getting cleaner slowly; however, it is clear that achieving the necessary nutrient load reductions will take many years and billions of dollars.

For example, preliminary cost estimates for the Potomac River, a major tributary to the bay, indicate that it may take \$155 million to \$244 million per year for an indefinite period to remove the necessary amounts of phosphorus and nitrogen from point and non-point source discharges to achieve and maintain the 40 percent bay-wide load reduction goal.

We need to be able to count on sufficient funding to accomplish this goal and cannot afford to have the necessary financial resources or public attention diverted from nutrients until these reductions are accomplished.

In closing, I want to compliment your efforts to date on behalf of the Chesapeake Bay and to express my appreciation on behalf of all Pennsylvania citizens. I look forward to your continued support, and thank you for the opportunity to share my views with you today.

Senator GRAHAM. Thank you very much, Ms. Glotfelty.

We have just had a vote called. Senator Baucus is going to stay and continue the hearing and I will vote and return so we will have as short an interruption of the continuation of this panel as possible.

Next is Mr. John Atkin of the Clean Water Jobs Coalition.

STATEMENT OF JOHN ATKIN, CLEAN WATER JOBS COALITION, NORWALK, CONNECTICUT

Mr. ATKIN. Thank you, Mr. Chairman. And I thank the committee for the opportunity to testify here today.

My name is John Atkin, and I am speaking on behalf of the Clean Water Jobs Coalition, which originated in the Long Island Sound watershed area.

I will share my experiences as a former member of the Connecticut House of Representatives and State Senate for ten years, as founder and Chair of the Long Island Sound Committee, as one of the founding members of the Clean Water Jobs Coalition, and as a person actively involved in Long Island Sound activities through

the Soundkeeper Fund, National Audubon Society, and other organizations.

I grew up in Norwalk, Connecticut—one of 98 cities and towns, including the New York City boroughs of Queens and the Bronx, that surround Long Island Sound. Today, as when I was a youngster, I swim and boat in the sound, and I have taught aboard a research vessel on the sound about the sound to youngsters and adults, alike, about the 450 species of marine life that inhabit the sound.

I have told my students that the sound has 577 miles of shoreline. It is 110 miles long and 21 miles wide at its widest point.

Mr. Baucus indicated earlier that 50 percent of the population was within 50 or so miles of the coast. I can tell you 10 percent of the population of this country lives within 50 miles of Long Island Sound.

That startling statistic is precisely why this estuary is stressed. Over 1 billion gallons of inadequately treated sewage pours from sewage from 44 different sewage treatment plants into the sound every day—almost 400 billion gallons a year.

Land development over the last 200 years has filled in nearly 75 percent of the coastal wetlands that acted as a natural buffer and filter for the runoff into the sound.

Additionally, the construction of industry, roads, and parking lots near the sound speed up the process of toxins, oil, salt, trash, and animal waste finding its way into the body of water.

The sound is bordered by two States and is serviced by two regions of the EPA—Connecticut in region one, and New York in region two.

Senator Lieberman's Long Island Sound Improvement Act of 1990 was an important step in recognizing the sound as a nationally significant estuary with its own EPA office after models set forth for the Chesapeake Bay and the Great Lakes.

This, along with the ongoing work of the Long Island Sound study under the NEP, the creation of the Bi-state Long Island Sound Committee, and the citizens' alliances and coalitions that have formed are further evidence of the sound being a priority water body for the Nation.

I stood on the shores of the sound on Calf Pasture Beach in Norwalk nearly six years ago and called on my then colleagues from the State of Connecticut and New York to join together on a formal and regular basis to examine what each State was doing in handling the problems of the sound. This effort was designed to complement the programs initiated under the national estuary program.

Identical legislation was introduced in both States by the former bi-state committee, and after passage and the signatures of both governors the first meeting was held. Governor William O'Neill of Connecticut attended and enthusiastically called for renewed action and cooperation between the States. And Governor Mario Cuomo of New York, through a spokesperson, did the same.

Since that day, as Dawn Martin earlier stated, the States' environmental agencies and legislative representatives have been working closer together than ever to further ensure that the issues deal-

ing with the sound are addressed equitably on both sides of the State line.

Today, public concern for the sound continues to be high, and major policy decisions are being discussed. In addition to the reauthorization of the Clean Water Act, the draft of the CCMP for the sound under the NEP has been completed, and the public has had an opportunity—many opportunities—to comment under this on the CCMP.

Although many of us, frankly, felt the plan fell short of expectations and are somewhat disappointed with the lack of technical discussion, we still realize that without it and without the NEP there would be little cooperation among the States.

For example, the no net increase of nitrogen plan that was adopted by Connecticut and New York probably never would have occurred without that plan.

We do need the leadership of this committee to ensure that the Federal Government remains an active player and a financial supporter in the effort to restore our sound. It is essential that the Federal Government remain a partner in assisting States and municipalities in upgrading sewage treatment facilities in the sound's watershed.

The continuation of funds in the Long Island Sound estuary to further assist in the establishment of the SRF funds must continue. Many Connecticut cities have been hit hard by the recession and massive deficits. In fact, a couple of years ago the city of Bridgeport actually filed for bankruptcy to demonstrate the severity of the situation in their city.

Finally, as my time runs out I'd like to talk a little bit about Senator Lieberman's bill, S. 815, the Water Pollution Control and Estuary Restoration Act, cosponsored by Senators Moynihan, Dodd, and D'Amato. In the House, Representatives DeLauro and Lowey have introduced companion legislation with over 60 cosponsors.

I have attached for the record a list of over 100 organizations from the northeastern United States in support of S. 815, including environmental groups, union, and building trade organizations.

Again, we need strong Federal support for the NEP for implementation of the CCMP, for continued coordination between State and Federal agencies, and for the funding levels of S. 815 to bring the SRF program to a level of \$5 billion annually with special set-asides for critical, nationally recognized estuaries such as the sound.

In conclusion, the sound represents an ecological system with some of the greatest urban population pressures in the Nation. A clean sound makes environmental and economic sense because it can pave the way to solving some of the complex problems facing estuaries nationwide.

We in the coalition are proud of the Long Island Sound region's leadership in bringing together jobs and the environment nationally. We can only hope that S. 815 will become part of the committee's Clean Water Act reauthorization proposal.

I thank the committee for the opportunity to testify today, and would be pleased to work with the committee and its staff if I can be of any assistance.

Thank you.

Senator BAUCUS. Thank you very much, Mr. Atkin.

Mr. Hansen? I believe you are the remaining witness. We may have to intervene if Senator Graham does not return in time, but why don't you proceed at this point?

STATEMENT OF PAUL HANSEN, DIRECTOR, MIDWEST REGIONAL OFFICE, IZAAK WALTON LEAGUE OF AMERICA, MINNEAPOLIS, MINNESOTA

Mr. HANSEN. Thank you, Mr. Chairman and members of the committee.

I am Paul W. Hansen, Director of the Midwest Office of the Izaak Walton League of America.

As you may know, the League has been deeply involved in Mississippi River conservation issues since 1924 when League-sponsored legislation establishing the Upper Mississippi National Wildlife and Fish Refuge was passed by Congress.

The pen that President Coolidge used almost 70 years ago to sign that legislation is displayed in my office today.

This year the Izaak Walton League's national convention was held in Davenport, Iowa, in mid-July, in spite of the floods.

I am here today to tell you that the Mississippi River desperately needs the special designation for watershed planning that Congress has provided to the Great Lakes and to our great estuaries. We have heard eloquent testimony today on the effectiveness of this approach, and we need it on the upper Mississippi.

The Mississippi River is the dominant watershed of the North American continent. It is the second-largest drainage basin in the world. Congress has designated the upper Mississippi in 1986 as both a nationally significant ecosystem and a nationally significant transportation system.

The Mississippi River is also considered one of North America's greatest environmental resources. It is home to almost 241 species of fish, 270 species of birds, and the narrow strip of green and blue through the Nation's agricultural heartland is a major flyway for over 40 percent of North America's waterfowl and wading birds.

The Upper Mississippi National Fish and Wildlife Refuge gets over 3.5 million visitors per year—more than Yellowstone National Park—during normal years.

As Senator Mitchell mentioned earlier, nutrient enrichment and sedimentation from contaminated runoff are degrading the Mississippi River ecosystem and are contributing substantially to development of a large oxygen-depleted anoxic area known as "The Dead Zone" in the Gulf of Mexico.

Senator BAUCUS. Mr. Hansen, I'm going to have to ask the committee to recess at this point. There is a vote going on, and I'm the last one here, and I've got to go vote.

Mr. HANSEN. Certainly. I understand.

Senator BAUCUS. Senator Graham will be back very shortly.

Mr. HANSEN. Thank you.

Senator BAUCUS. Thank you very much.

[Recess.]

Senator GRAHAM. I call the committee back to order.

Mr. Hansen, I understand you were in the midst of your statement when Senator Baucus had to leave. We have been joined by several Members of the House of Representatives who are in the same situation we are, and that is facing a series of votes.

If you would be kind enough to let us hear from those Members of the House, then we will return to panel three and hear the balance of your statement and questions that might be asked.

Mr. HANSEN. Certainly.

Senator GRAHAM. I appreciate your indulgence.

Panel four is Members of the House, Eric Fingerhut of Ohio, and Marcy Kaptur, also of Ohio. I know that Ms. Kaptur is here because I saw her in the elevator. Is Congressman Fingerhut here?

Senator FINGERHUT. Yes, Mr. Chairman.

Senator GRAHAM. If you could, please come forward. Maybe Mr. Coy or Mr. Hansen could share your chair momentarily.

Senator METZENBAUM. Mr. Chairman, I'd like to make a brief statement, if possible.

Senator GRAHAM. Senator Metzenbaum also has a statement relative to the subject of panel four of the Great Lakes.

Senator WARNER. What happened to the Chesapeake Bay panel? I went to vote, and they've gone?

Senator GRAHAM. No. They are still here. We are going to hear from Members of the House of Representatives who are here to testify, following our rule of recognizing Members of the Congress as they arrive.

Senator WARNER. Mr. Chairman, could you advise the members of your subcommittee what time we would likely have the opportunity to pose questions to panel three?

Senator GRAHAM. I would say that, assuming that Senator Metzenbaum, who has a statement, and Ms. Kaptur and Congressman Fingerhut use approximately five minutes apiece, in 15 minutes we'll be back to that panel.

Senator WARNER. Thank you very much.

Senator GRAHAM. Senator Metzenbaum?

OPENING STATEMENT OF HON. HOWARD M. METZENBAUM, U.S. SENATOR FROM THE STATE OF OHIO

Senator METZENBAUM. Mr. Chairman, thank you very much. I have a brief statement.

I am not a member of this subcommittee, but I wanted to attend today's Clean Water Act reauthorization hearing on regional issues because of my involvement in clean water issues as they relate to the Great Lakes.

Before I begin, I'd like to express my appreciation to the chairman of this subcommittee and the ranking member for all the work they have done in holding this series of hearings on the Clean Water Act reauthorization.

There is little doubt about it: tremendous progress has been made in cleaning up our rivers, lakes, streams, and ocean coasts, but more remains to be done.

Untreated sewage, industrial discharges of toxic pollutants, and pollution from urban and agricultural runoff still threatens our waterways.

The Clean Water Act reauthorization bill that Senators Baucus and Chafee introduced not too long ago addresses these water pollution issues on a national basis, but there are regional bodies of water that have unique problems and deserve special attention. One of them is the Great Lakes.

What a marvelous asset to this Nation the Great Lakes are. It is simply impossible to overstate the importance of the five Great Lakes. Their value is a source of freshwater, food, transportation, and recreation. They are the highway of shipping and commerce in the Nation's most industrialized region, stretching from the Iron Mountains of Minnesota through the great manufacturing cities of Detroit and Chicago and Cleveland and Buffalo. They are an unparalleled fishing and recreational resource. They are the primary source of drinking water for millions of Americans. They constitute—and this is such a significant fact—constitute over 95 percent of this Nation's fresh surface water.

Yet, the shorelines, the tributaries, the open lakes, themselves, are in danger. They are endangered by industrial pollution, agricultural runoff, municipal sewage—even the oil and grease running off city streets.

I introduced S. 1183, the Great Lakes Clean Water Amendments of 1993, in an effort to enhance the water quality of this precious national resource.

My legislation, which is an expanded version of something I offered last year to the water resources bill, is meant to fit within the broader Clean Water Act reauthorization bill.

I would ask that a longer version of my statement appear in today's hearing record.

Senator GRAHAM. Without objection.

Senator METZENBAUM. Let me close by summarizing some points from my bill.

The bill reflects a broad-based effort to address contaminated sediment issues and other problems confronting the Great Lakes. Under my bill we will test new sediment cleanup technologies, establish more environmentally sensitive requirements for dredge sediment disposal, provide incentives for industry for pollution prevention and provide a mechanism for enforcement penalties to be reinvested into Great Lakes cleanup programs.

Congresswoman Marcy Kaptur and Congressman Eric Fingerhut, two of whom are our pride and joy, will testify about comparable legislation in the House. I think we are well on our way toward enacting solid, comprehensive legislation which will be of benefit to the Great Lakes and the entire country.

I look forward to working with members of the Great Lakes communities, and members of the subcommittee and the full committee on my legislative initiative, as well as on the broader Clean Water Act reauthorization.

I am particularly pleased that Congresswoman Kaptur and Congressman Fingerhut are both with us this morning.

[Senator Metzenbaum's prepared statement follows:]

STATEMENT OF HON. HOWARD M. METZENBAUM, U.S. SENATOR FROM
THE STATE OF OHIO

Mr. Chairman, I'm not a member of this subcommittee but I wanted to attend today's Clean Water Act Reauthorization hearing on regional issues because of my involvement in Clean Water issues as they relate to the Great Lakes.

Before I begin, I would like to express my appreciation to the Chairman of this subcommittee, and the ranking members, for all the work they have done in holding this series of hearings on the Clean Water Act Reauthorization.

There is little doubt about it. tremendous progress has been made in cleaning up our rivers, lakes, streams, and ocean coasts. But more remains to be done.

Untreated sewage, industrial discharges of toxic pollutants, and pollution from urban and agricultural run-off still threaten our waterways.

The Clean Water Reauthorization bill, which Senators Baucus and Chafee introduced not too long ago, addresses these water pollution issues on a national basis. But there are regional waterbodies within the country that have unique problems and deserve special attention.

One of them is the Great Lakes.

It is simply impossible to overstate the importance of the five Great Lakes—their value as a source of fresh water, food, transportation, and recreation.

They are the Highway of Shipping and Commerce in the Nation's most industrialized region, stretching from the iron mountains of Minnesota through the great manufacturing cities of Detroit, Chicago, Cleveland, and Buffalo.

They are an unparalleled fishing and recreational resource.

They are the primary source of drinking water for millions of Americans. And they constitute 95 percent of this Nation's fresh surface water.

Yet the shorelines, the tributaries, the open lakes themselves are in danger. They are endangered by industrial pollution, agricultural runoff, municipal sewage, even the oil and grease running off city streets.

I introduced S. 1183, "The great Lakes Clean Water Amendments of 1993," in an effort to enhance the water quality of this precious national resource. My legislation, which is an expanded version of something I offered last year to the Water Resources Bill, is meant to fit within the broader Clean Water Act Reauthorization Bill.

Sensors Glenn, Riegle, Levin, Kohl, Feingold, Simon, and Moseley-Braun are co-sponsors. Congresswoman Kaptur, D-Toledo, Ohio, and Congressman Fingerhut, D-Mayfield Heights, Ohio, will be here today to testify about comparable legislation being offered in the House.

Specifically, my bill seeks to better manage the disposal of polluted lake sediments that must be dredged regularly from the rivers and harbors in order to maintain shipping. Sometimes these sediments are so polluted they must be confined in disposal facilities. Sediments that are only mildly polluted are simply dumped in the lakes.

The threat to human health presented by polluted sediments—whether they are confined or dumped—is very real. Food chains poisoning, which begins with the fish, winds up on the dinner table. According to a national research council report, neuro-muscular impairment, small birth weight, and smaller head size in infants was pronounced in mothers who ate toxic Laden Lake Michigan fish only twice a month.

My legislation will require the corps of engineers to pay more attention to environmental concerns when deciding where to dump dredged spoils in the lakes and give EPA a bigger role in this disposal process. The bill will also require that all of the existing—and any new—confined polluted sediment facilities have management plans that include provisions for reclaiming the land and monitoring it after the facility has closed.

The Bill also addresses the issue of sediment accumulation. It requires the corps of engineers to measure sediment loadings into the major tributaries of the lakes and sets up a grant program to promote projects which can reduced sediment run-off in the first place.

In addition, the bill will facilitate the clean-up and removal of contaminated sediments by allowing five full-scale technology cleanup demonstration at toxic hot spots identified within the Great Lakes.

But the Legislation moves beyond the sediments problem. It provides incentives to Great Lakes industries to install new pollution prevention technologies. It also gives towns and cities technical help in reducing the run-off from streets and parking lots that pollute the lakes.

There is language in the bill to coordinate research efforts now carried out by several Government agencies and to set deadlines for EPA action on developing

Lakewide Management plans to set out the long-term strategy for restoring, protecting, and maintaining high water quality in each of the Great Lakes.

Finally, the bill creates a revolving fund into which penalties from Great Lakes specific water quality violations will be deposited, thus creating a source of funding for Great Lakes water quality programs.

This is a solid and comprehensive proposal. It has cleanup, it has management and it looks to the future.

Mr. chairman, I look forward to working with members of the Great Lakes community, members of the subcommittee and the full committee on my legislative initiative as well as on the broader Clean Water Reauthorization.

Senator GRAHAM. Congresswoman Kaptur?

STATEMENT OF HON. MARCY KAPTUR, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Ms. KAPTUR. Thank you very much, Mr. Chairman, our esteemed Senator Metzenbaum, Senator Warner, and members of the committee. It is a real pleasure to appear before you this morning, and I would like to submit my statement in entirety for the record and not burden you with reading all of it, but I would like to summarize.

Senator GRAHAM. That's very kind. Yours and all the statements will be submitted in full for the record.

Ms. KAPTUR. I thank you. It is also a pleasure to be here with my colleague, Congressman Fingerhut, who represents the northeastern portion of Ohio. I am on the other side of the State, the northwestern part. The bluffs rise in the northern part of Ohio from our region where there is about a 2 percent slope all the way up to the Cleveland area, so the topography is rather interesting.

I wanted to come especially this morning as Chair of the Northeast Midwest Coalition on the House side to make sure that the Great Lakes Region was on the radar screen of members of this subcommittee as it conducts its important work, as well as the full committee.

I wanted to come in full support of all of the work that Senator Metzenbaum, as well as Senator Glenn, has done on the Great Lakes Clean Water Act Amendments. The Senator has referenced that Act this morning.

Twenty years ago, for those of us who can remember back that far, Lake Erie literally was a dead lake. There is a rather interesting phenomenon that occurs in the Great Lakes Region. Our lakes, as a whole, flush out very slowly. So you've got Lake Superior that takes about 200 years to flush out, Lake Michigan 100 years, and Lake Erie, because of its shallowness, but three years.

That creates, with our very low slope, a real problem that is particularly addressed by the Senator's bill in terms of pollution prevention as well as this business of reducing contaminated sediments into the lake.

I wanted to talk a little bit about some of the specific problems we have had in our area as a result of our topography.

Agricultural runoff is our major problem right now—the non-point source pollution. In fact, if you look at Ohio, my corner costs the Army Corps of Engineers \$7 million a year just to keep our fishing channels open, largely because of the shallowness.

Unfortunately—and it is really sad to say this, but we haven't found the trick to get the Environmental Protection Agency and

the Army Corps of Engineers to work together cooperatively. I think the UAW and Chrysler, Ford, and General Motors have a lot to teach our Federal agencies about working together toward a common end.

We have a real problem, and we would ask your specific attention to this in the legislation that you draft.

We had a situation where our port was practically closed down because EPA did not want the Corps of Engineers to open lake dump the substantial sediments that have deposited in our shipping channels, and the bureaucracy of this has held up resolution of the problem for such a very long time.

This can't continue to go on in the Great Lakes area, and I dare say other sections of the country.

In addition to that, in the area of contaminated sediments, I know that the Senator has provided in his bill demonstration areas for sediment reduction. We need to find a way to deal with the massive amount of materials—literally trainloads full—every year that are currently being open lake dumped in lakes like Lake Erie.

Our disposal facilities are full, and there has to be a better way. The Army Corps down at the Mississippi facilities has some suggested ways of reusing some of the sediment, getting rid of the toxics in it, and providing a lot of that for fill or, in fact, for fertilizer and other uses.

We would encourage you to, support their efforts to stop these contaminated sediments from going into the lakes in the first place through working with stream bank buffers, windbreaks, cover crops, wetlands, reducing chemicals and agricultural pesticides and fertilizers, etc. Perhaps selecting a few of these areas so we can work together and look toward the 21st century.

I also wanted to bring another area to your attention which I know Senator Metzenbaum cares very deeply about, and my testimony is very detailed on this. Even though this concerns the Clean Water Act, the relationship of what you are doing to border clean-up—not just U.S.-Canadian border, but U.S.-Mexico border. My testimony has significant information in it about the requests we are now getting—and I serve on the Appropriations Committee over on the House side for EPA—from this Administration and several past Administrations to provide special treatment for installation of clean water, as well as sewage facilities, down at the U.S.-Mexico border.

We are not saying that isn't an important region to be concerned about. However, the many of the proposals at the southern border are for grants, as opposed to matching requirements which are required of states in our area of the country. We ask for a level playing field.

Whatever is done at the U.S.-Mexico border, we ought to have the same treatment at the U.S.-Canadian border. That is not now the case. We have 43 contaminated toxic areas in the Great Lakes. We haven't taken care of them. Some of the very same companies that caused the problem up in our region are now moving south of the border and have already polluted down there. There is no reason that we should let those folks off the hook.

So we are asking for a level playing field, a national policy that treats all regions of the country fairly.

My testimony is very detailed in that regard.

Senator Metzenbaum, I know you will be our conscience and watchdog on that issue here. My testimony includes numbers from EPA, USDA, Interior, HHS, and State on where that money is being requested and where it is going. Our taxpayers have a right to be treated fairly in our region.

I thank you very much for your attention.

Senator GRAHAM. Thank you, Madam Congresswoman.

Let me just insert a modification of the response I gave a few moments ago to the Senator from Virginia.

One, we have just started another vote, so there will be an interrupt for that. We also have two other Members of the House of Representatives who have joined us to speak on panel five relative to the Gulf of Mexico, so it would be my intention to hear from Congressman Fingerhut, then move to the other two Members of Congress who are here, hopefully hearing all of those before we must take a temporary recess for purposes of a vote.

Congressman de la Garza?

Mr. DE LA GARZA. Would you respectfully do me the courtesy of submitting my statement for the record and not appearing in person?

Senator GRAHAM. Congressman, we appreciate that. We regret that we cannot have a chance to hear from you directly, but we will certainly receive your statement and give it full attention. (See p. 993.)

Senator WARNER. I join the chairman in that, and must say with some disappointment because we all have a very high admiration of your lengthy experience in this field.

Mr. DE LA GARZA. Thank you very much, Senator. There will be other times. I appreciate it.

Senator GRAHAM. Thank you very much.

Senator GRAHAM. Mr. Fingerhut?

STATEMENT OF HON. ERIC FINGERHUT, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Mr. FINGERHUT. Thank you, Mr. Chairman.

As the person who has served in Congress for the briefest time of anyone in the room, I will make my statements the briefest.

It is truly a pleasure to appear before this subcommittee and Mr. Chairman and Senator Warner, and my extraordinary personal privilege to be before Senator Metzenbaum, who not only is one of my heroes, but is one of my constituents, and therefore I must mind my Ps and Qs. I assure you that he frequently calls to complain to his Congressman about various things happening on the House side.

Senator METZENBAUM. The record should reflect that the Representative from Ohio was a member of this committee and understands very thoroughly the work of this committee and made many valuable contributions during his service. We miss him.

Mr. FINGERHUT. Thank you very much, Senator.

Mr. Chairman, Congresswoman Kaptur, who is really the leader of our Northeast Midwest Caucus on this issue, has spoken eloquently about it.

I'd like to give maybe just one comment as a new Member who represents a significant part of the short of Lake Erie, and that is that we live in a time when the skepticism about the work of government and the success or failure rate of government programs is probably at a record high.

The history of Government involvement, and particularly the Clean Water Act, with respect to the Great Lakes is one of extraordinary success. We took an area—really you took, Senators, through your work on this area—one of the greatest natural resources that exists anywhere in the world and that had been, through the work of man, polluted almost beyond recognition, and you have brought it back to life through the work of the Clean Water Act.

The Great Lakes in many ways—I saw the list of all the panels that will be speaking—was in many ways the forerunner of all the work that happened in the other natural resources of our country. We were a regional approach to cooperation. In many ways we were an environmental laboratory for some of the approaches that this Congress has enacted.

I would just like to point out that not only have we seen environmental benefits from this, but we have seen economic benefits. We have a \$4.5 billion annual sport fishing industry now across the Great Lakes basin. We have \$8.5 billion annual recreational economy just in the Lake Erie portion of the Great Lakes.

And in my district, alone, we estimate that if we continue to work toward the goals that Congresswoman Kaptur has articulated, particularly with respect to cleaning up the sediments in the rivers to opening up the rivers that flow to the lake, that we have \$60 million in economic development on hold right now just in the Ashtabula River area, which is in the far northeast section of my district, that we would unlock if we can make significant progress to unlock the difficulties that have existed around the issue of cleaning up the sediments in the rivers and to continue to upgrade the quality of the Lake Erie basin.

I would like to point out that I have introduced two portions of the Clean Water Act Amendments as separate legislation in the House. Congresswoman Kaptur has introduced other portions of those amendments as separate legislation. We will be together presenting them to the Public Works Committee in the House, and we are pushing on our side to keep these issues moving forward.

The bills that I have personally been working on involve taking the sediment research program, which Congresswoman Kaptur already referenced, beyond the experimental stage to the developmental stage, which is necessary, and to also coordinate all the work of our environmental agencies.

I have to underscore Congresswoman Kaptur's comments about the coordination between the EPA and the Army Corps of Engineers and the variety of other agencies that are involved in this project.

I am pleased to note that the new administrator of the EPA was out in Cleveland a couple of weekends ago. We went out with her on the lake to test water quality. She appears to be seeking to be very responsive to this area, and we encourage that and we compli-

ment them and thank them, but it is critical that the government agencies work together.

So thank you again for your interest in this issue, Senator Metz-enbaum. Thank you for the honor of being invited to testify.

Senator GRAHAM. Thank you very much, Mr. Congressman.

I would like to ask if Congressman Callahan, who is also here, could please come forward. I'd like to receive his statement before we have to leave for this next vote.

Senator Metz-enbaum?

Senator METZENBAUM. Yes. Could I just ask unanimous consent that the statement from Senator Glenn be included in the record at an appropriate place?

Senator GRAHAM. Without objection. (See p. 995.)

Thank you very much.

Congressman Callahan?

STATEMENT OF HON. SONNY CALLAHAN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ALABAMA

Mr. CALLAHAN. Thank you, Mr. Chairman, first for having this hearing and giving us the opportunity to testify.

Let me first say that those of us who are interested in the Gulf of Mexico program share enthusiastically the aims and the goals of Senator Warner with respect to the Chesapeake Bay, and with Senator Metz-enbaum with respect to the Great Lakes.

Our legislation tries to put us on a partial parity with these two great water bodies by giving recognition to some of the problems we have in the Gulf of Mexico.

The Gulf of Mexico is seven times larger, I think, than the Great Lakes. I think it is probably 90 times larger than the Chesapeake Bay. We in the past have not, we don't think, received adequate attention from either the EPA or the Congress with respect to some of the solutions that are available for the problems that face us in the Gulf of Mexico.

So our Gulf of Mexico bill takes a step in the right direction. It lets us cooperate with you to continue the efforts to improve the Chesapeake Bay and the Great Lakes, but at the same time it puts us on a partial parity saying we have a large body of water and the Gulf of Mexico is crucial to our local economy, it is crucial to the international and national economy, and it is crucial to the environment to have solutions to problems rather than just to have the police force of the EPA and Congress mandating as to what the problems are.

So that's the purpose of our legislation, which we ask that you incorporate in your Clean Water Act, and that is the purpose of our establishment of the new Gulf of Mexico Council.

With that, Mr. Chairman, I want to submit my official statement for the record, and also take the opportunity to request permission to submit for the record the statement of Congressman Greg Laughlin of Texas, who is the chief sponsor of the Gulf of Mexico bill.

Mr. Chairman, we know that you especially share with us some of the concerns for our beautiful Gulf of Mexico, and we hope that we can get the cooperation of those Senators who represent areas

such as the Chesapeake Bay and those who represent areas such as the Great Lakes to assist us in our effort to do just what they have already started doing in those bodies.

I thank you, Mr. Chairman.

Senator GRAHAM. Congressman Callahan, thank you very much. We will be pleased to receive your statement, as well as the statement of Congressman Laughlin. (See p. 996.) I know how hard you have worked.

Senator WARNER. Thank you, also, Congressman, very much. Thank you.

Senator GRAHAM. Also, we are joined by Senator Gramm.

As you know, we have a vote underway, if you would please take a seat.

Senator GRAMM. I'll be brief.

STATEMENT OF HON. PHIL GRAMM, U.S. SENATOR FROM THE STATE OF TEXAS

Senator GRAMM. Mr. Chairman, thank you for having this hearing. We want America to recognize that the Gulf of Mexico is America's sea.

We want to bring the level of our research and our commitment to a sound environment there to the level of the Chesapeake Bay and the Great Lakes. We are proud of your leadership. We want to work with you. We have a strong bipartisan base of support, and we thank you for your leadership.

Senator GRAHAM. Thank you very much, Senator Gramm.

If you have any further statement, it will be incorporated fully in the record.

We have five minutes remaining on the vote that is currently underway, so we will recess and reconvene. I see Senator Bingaman is here.

Senator, I apologize, but we will receive your statement as soon as we can return from this vote.

Senator DURENBERGER. I voted. Do you want me to take it?

Senator GRAHAM. I'm sorry. Senator Durenberger, who has voted—Senator, if you would continue the hearing, we have been receiving testimonies from Members of Congress as they arrive. We have heard from all Members of Congress who are here, to my knowledge, other than Senator Bingaman, who is here.

If you would hear Senator Bingaman's statement, then we'll return to panel three. We were in the midst of testimony from Mr. Hansen about 30 minutes ago when he was interrupted.

Senator DURENBERGER. Thank you, Mr. Chairman.

Jeff, I guess you are our next witness.

STATEMENT OF HON. JEFF BINGAMAN, U.S. SENATOR FROM THE STATE OF NEW MEXICO

Mr. BINGAMAN. Mr. Chairman, in the tradition of this august body, I will make my statement short and put my full statement in the record.

The two points that I wanted to—

Senator DURENBERGER. Jeff, if I could interrupt, do you have a constituent here by the name of Judith Espinosa?

Senator BINGAMAN. Yes. There she is.

Senator DURENBERGER. Why don't we ask Judith come to the table, as well.

Ms. ESPINOSA. Thank you.

Senator DURENBERGER. Thanks.

Senator BINGAMAN. Judith Espinosa is the Secretary of Environment in our State, and she is more knowledgeable than I on some of the specifics of the wastewater treatment needs.

Let me make a very brief statement here and then defer to her for any more in-depth comments she has.

There are two issues that I want to bring to the committee's attention as it works on reauthorization of the Clean Water Act.

One of those issues is the problem of colonias, which are communities that are situated along the U.S.-Mexican border, or within reasonable distance of the U.S.-Mexican border in rural residential areas. They are usually unincorporated. They are generally without paved roads. They are very small. Some of them are getting larger, unfortunately, but they are in the range of 250 to 5,000 people per colonia in New Mexico.

They have sprung up along the U.S.-Mexican border on the U.S. side of the border. Without adequate plumbing, without adequate drinking water, comprised of extremely small lot sizes many with mobile homes, they create a high rate of disease and severe health and environment problems.

This last year the Congress recognized the problem and appropriated about \$60 million to EPA for wastewater treatment grants in these areas, but it is clear that much more needs to be done.

We need to have clear legislative authority to deal with the problems of these colonias. These are a national problem, not a local or a State problem. They present a national problem that arises by virtue of our international border with Mexico.

So I hope very much that this committee will accept an amendment that we have prepared which would authorize, as part of the Clean Water Act, funding to go to these colonias for basic infrastructure and to deal with some of the health and environment problems.

The other issue I want to very briefly address is the problem we have with small, disadvantaged communities—wastewater treatment needs of small, disadvantaged communities—which are not incorporated and which have inadequate wastewater systems.

These are communities such as the South Valley in Bernalillo County. It is an area which is, unfortunately, too large to qualify for a rural grant, as that authority is in the law, but too small to shoulder the very high per-household cost of hookup to sewer services at this point.

What we need there, again, is an amendment to the Clean Water Act to permit Federal funds to help with construction through some type of financing.

I think, as I said, the South Valley in Bernalillo County is a prime example of this problem. We have about 12,000 citizens there who do not have adequate wastewater treatment, which can result in contaminating the drinking water in many cases. Some type of Federal grant program to assist in that particular circumstance I

think is a very worthwhile thing to look at as part of the Clean Water Act.

I will just stop at that point, and if you could take a few minutes to hear from Judy, that would be great.

Senator GRAHAM. Ms. Espinosa, it is a pleasure to welcome you.

STATEMENT OF JUDITH ESPINOSA, CABINET SECRETARY, NEW MEXICO ENVIRONMENT DEPARTMENT

Ms. ESPINOSA. Thank you, Mr. Chairman. I very much appreciate my being able to go with Senator Bingaman on these critical issues.

I am Judith M. Espinosa, the Cabinet Secretary for the New Mexico Environment Department. I would ask, Mr. Chairman, that my written testimony be entered fully into the record, which I believe I have provided staff.

I want to echo what Senator Bingaman says. When we talk about the international border with Mexico, we are not just talking about a very local or regional problem. And I don't think I am speaking out of turn when I tell you that colonias and the growth and development that has occurred over the last two decades is an increasing problem for all of the border States, and also the rest of the country.

I think as we move into a North American Free Trade Agreement consideration and we move into looking at environmental concerns along the border, it is imperative that, as Senator Bingaman sponsors Senate bill 1286, that we are able to fund much of the development on wastewater treatment that we will need in future years in the colonias.

I might also add, Mr. Chairman, that in looking at the Clean Water Act, that we also look, as Senator Bingaman stated, at disadvantaged communities. Again, although we are specifically concerned about New Mexico, this is a problem throughout the country.

There are many semi-rural entities around various urban areas that lose out on the long run to any kind of funding mechanisms now available to them. They are too poor to even pay back zero percent loans that States are able to offer them, and yet they can't get grant monies that are often scheduled for rural areas.

So we would very much appreciate it if the committee would look at the whole situation of disadvantaged communities as Senator Bingaman has defined in those semi-rural areas.

I might also say, Mr. Chairman, that last year New Mexico received \$10 million for colonias development. We have already gotten that money out, so it is already going to work. We received it. It was authorized in September, we received it in November. The design work is out there. It is working in the communities.

The first phase is the engineering designs, and the second phase will be the actual construction and implementation which we will start later on this fall in New Mexico.

So the States can turn around the money very quickly, and so when you give it to us it doesn't sit around and get wasted by any of our State agencies.

Also, Mr. Chairman, I would say that to allow the administrator to be able to issue grants for colonias wastewater treatment shouldn't just come without some kind of responsibilities from the States.

We are not here just asking for a handout, and we are not here just asking for a handout so we can give to local communities for wastewater treatment. We also feel that we must be responsible.

Let me give you a few examples of how New Mexico is responsible for the grant money it gives out.

Senator DURENBERGER. You'll have to do it quickly, if you can. Thank you.

Ms. ESPINOSA. Yes.

We would require each grant award that—we look at alternative and appropriate technology issues be evaluated, we look at things like constructed wetlands. We also look at upgrading on-site systems and not just developing a whole new system if it is not suitable or necessary. And, best of all, we are looking at comprehensive regional plans that will discontinue the exploitation of underprivileged people and lower socioeconomic people and get them wastewater treatment as much as possible.

And so I think that with our money we will also be responsible on the State end, and I urge you to support Senate bill 1286.

I thank you very much for your time.

Senator DURENBERGER. I thank you. You did a wonderful job in a very short period of time. We appreciate your being here, and especially Jeff and the leadership he always provides us on this issue.

If I may, I'm going to ask Paul Hansen to come back. He has about a minute left in his presentation. He has one point he wants to make strongly, and then my colleague, Joe Lieberman, is going to introduce the gentleman from Connecticut.

Mr. HANSEN. Thank you, Senator Durenberger.

As I mentioned to the committee prior to our break, the Izaak Walton League has been very active on Mississippi River issues since 1924 when League-sponsored legislation established the Upper Mississippi Wildlife and Fish Refuge.

I'm here today with one simple request, and that is that we add to this legislation special designation for the Mississippi for watershed planning such as has already occurred for the Great Lakes and the Chesapeake Bay.

We have heard some very eloquent statements today on how effective that special designation has been, and we desperately need this in the Upper Mississippi region.

As you know, the floods of 1993 would have been devastating to human development on the historic floodplain under any management scheme, but it is clear that this has been made worse by the drainage of wetlands, channelization of the river, and proliferation of levees. This is the second 200-year flood that we have had in the past 20 years, and hydrological analysis has shown that this flood was two feet higher than a flood in 1844, even though the flow was 35 percent less.

This flood highlights the fact that the U.S. Army Corps of Engineers manages the Mississippi in a manner that sacrifices the multiple purposes of river management, including flood control, envi-

ronmental management, and recreation, for the single purpose of navigation.

The balanced use called for by Congress on numerous occasions still has not been accomplished on the Mississippi.

For example, in March of this year the Corps has announced the beginning of a \$33.6 million feasibility study on \$4.8 billion worth of navigation capacity expansion measures.

We in the region find it to be a cruel irony that \$33.6 million will be spent on the evaluation of navigation expansion on single-purpose use with little or nothing spent on overall watershed planning for the beleaguered Mississippi region.

This is especially important in light of a recent report, "Transportation and Iowa's Economic Future," performed by the University of Iowa's Public Policy Center, which concludes that it is significant that even with a major subsidy the cost of shipping grain from Iowa elevators to New Orleans is only marginally cheaper by barge than by rail.

The study concluded, "In the case of large-scale capacity enhancement of locks and dams in the Mississippi, the large costs and uncertain demands argue against advocating these investments at the present."

So I am here today not to tell you that I have all the answers to management questions raised by the floodwaters, but to tell you that we need answers to these questions very desperately in our region.

We request that you add a provision for watershed planning to this legislation, a study that could provide information on how we can best achieve objectives for flood control for the environment and for navigation.

Thank you very much for this opportunity to testify. My full statement has a number of more specific recommendations.

Senator DURENBERGER. Thank you, Paul.

Senator GRAHAM. Mr. Hansen, I regret that the votes caused me to miss both ends of your testimony.

Senator Lieberman?

Thank you, Mr. Chairman. The schedule obviously in the Senate today is such that we are being peripatetic, and at the same time regretful. I want to express both my regrets and admiration for John Atkin from Connecticut who has been here testifying today.

I have read John's testimony, and I salute him for it and really more generally for the extraordinary leadership that he has shown in bringing together a unique precedent-setting coalition of environmentalists, labor leaders, workers, construction industry people, business generally, all recognizing shared interest in cleaning up the sound and the specific case of infrastructure investments in upgrading the sewage treatment facilities that must be upgraded if we are going to clean the water. That requires money.

It also, as John has noted, not only will clean up the sound—or will help to do so—but will generate jobs. A sewage treatment plant investment generates as many, and in some ways more jobs than building a highway or a bridge, which has been our traditional vision of what infrastructure investment is about.

And it also has the same kind of spin-off in terms of quality of life and improvement of economic condition generally—attractive-

ness of a State, attractiveness to business, job creation—that other forms of infrastructure have.

Thank you, Mr. Chairman. I wanted to specifically thank John for coming down. I apologize that I could not hear his testimony. We look forward to working together with you.

Senator GRAHAM. Thank you very much, Senator Lieberman.

Senator Durenberger, I want to thank you for continuing the hearing. Do you have any questions?

Senator DURENBERGER. No. Thank you very much.

Senator GRAHAM. Senator Chafee, questions?

Senator CHAFEE. No, thank you, Mr. Chairman.

Senator GRAHAM. I want to thank this panel for an exceptionally instructive set of statements.

As the first panel, you have impressed us again with the importance of maybe thinking globally but acting locally as an operating premise.

Also, the leadership by example that your past experiences are going to provide to other areas of the Nation will be extremely helpful.

I just spent a few moments with Mr. Baker to ask some questions about the Chesapeake Bay Foundation for purposes of some similar possible organizations in my State, so I especially thank you for giving us that model to follow.

I want to again express the committee's appreciation for your being here today, and particularly for your patience in a somewhat disjointed morning.

Thank you.

We are going to make a slight change in our schedule by merging panel six and a portion of panel eight so that we can have a concentrated discussion on the situation in Boston Harbor.

Panel six is Senator John Kerry, who is with us; Senator Kennedy, who also joins us; Mr. A. Paul Cellucci, the Lieutenant Governor of the Commonwealth of Massachusetts; Mr. Doug McDonald, the Executive Director of the Massachusetts Water Resources Authority.

Senator Kennedy?

STATEMENT OF HON. EDWARD KENNEDY, U.S. SENATOR FROM THE COMMONWEALTH OF MASSACHUSETTS

Senator KENNEDY. Thank you very much, Mr. Chairman, Senator Chafee, and the others.

First of all, I want to express our appreciation very much to the members of the committee for the opportunity to make this presentation and for your courtesies to myself, Senator Kerry, our Lieutenant Governor Paul Cellucci, who is here and testifying, and Doug MacDonald of the MWRA.

We will try—we understand the interruptions which have taken place over the course of the morning, and that will continue, so we don't need to take a great deal of time.

I want to thank you also for the opportunity to visit with you at a more leisurely pace, and other members of the committee, in going into very considerable detail on this issue, and we are grateful to you for the preparation that you did and the knowledge and

the understanding that you have about this particular undertaking.

The members of the committee may be interested in the history about why Boston is in the situation that it is, and we are prepared to provide the various information which I think would indicate very clearly shared responsibility between governmental agencies and State officials.

I personally believe, in reviewing it, that it lies more with the agencies, but that really is very much in the past.

Second, the efforts to try to clean up Boston existed long before 1987 when many of the other cities across the country were moving forward to take advantage of the then Federal resources that amounted to 75 to 80 percent of the cleanup in a number of the other communities. But after 1987, a number of the communities—just two or three, actually—were really left behind when they were trying to come to grips with the monumental challenges of cleanup, and then to have the court requirements for cleanup.

The greatest example that we are speaking about directly today is Boston, but we have a number of other communities that are familiar to the Members down in the Bedford/Fall River and other communities in our State.

Nonetheless, what we are saying here, Mr. Chairman, is that the Clean Water Act is basically a partnership between the local citizenry, the State, and the Federal Government. What has happened now is that there is really only one individual or one group of individuals involved, and that is the local ratepayers.

What has happened now, as you will hear, is that Boston ratepayers have moved from 10 or 15 in terms of where they were paying over three or four years ago to number 1, a 300 percent increase in the last year or last two years, and that is going to increase to more than \$1,000 in the next three years. Some have estimated it will go even double that in the next five to seven years, and virtually prohibitive.

It is higher than local taxes, higher than Federal taxes, and it is falling on almost half of the population in that State.

A great deal of focus and attention is on reconciliation, on health care. People in those communities care about one thing, and that has been the increase in their water rates, which is effectively bankrupting them. It falls within a particular difficult period of time because of the economic pressures on those communities.

These are, by and large, working class communities. By and large senior citizens own those homes. The dramatic adverse impact that is having in homes in not only the immediate Boston area, but effectively almost half the total numbers of the State, has been absolutely dramatic.

The cleanup of Boston Harbor, when it takes place, is unlike a building or a bridge. The benefits will be for 100 years. There will be individuals, companies, and corporations that will make millions and even billions of dollars on that down the road. We know that. We understand that.

But now the pressure is in terms of this particular group of homeowners. We want to share partnership. We want to share partnership between the ratepayers, between the States, and the Federal Government.

We are asking you specifically for the short-term reauthorization to the Clean Water Act. We are talking about the changes in the Clean Water Act that we will outline in my own testimony that we hope will be supported. And we are very hopeful, as well, that in the Clean Water Act there is going to be attention given to other communities that exist in our State to provide some relief to them as they are moving under these court mandates.

And we are also going to ask you for continued coverage of the national estuary statute so that communities that have been incorporated as in the cleanup of Narragansett Bay can be continued because very, very important work is being done there, and we also want to make sure, under the national estuary program, that section 320 will be included, as well.

Finally, Mr. Chairman, because I see the clock is on, just to give you some idea of what is happening, we are mad and we won't take it. Fed up. The panel votes not to pay the MWRA. The tax rebels jump your water rates.

The fact of the matter is this is not going to work. It just isn't going to work as it is constructed now. People haven't got the resources to be able to do it.

As you will hear later, you've got major investments now that have already been done. It isn't a chance of stopping and going back. This is an absolute public policy and real kind of a crisis that all of us are attempting to try to find ways of doing it.

You will hear recommendations and ideas and suggestions and flexibility to try and permit the program, itself, to be altered and changed, to take into consideration new technologies, changes in the program to try and bring some reductions in terms of the total cost. That will be testified to this morning.

But we believe this is a matter not just in terms of Boston and a number of the communities, but it is a matter of enormous national importance.

I dare say that if we are unable to at least come to grips with this kind of a situation, then the kind of commitment that this country has made to try to do something about clean water in our society is really going to be threatened and undermined. I think all of us want to avoid that.

Mr. Chairman, I would like to file my full statement in the record. Again, I am grateful to you for the opportunity to make this presentation and for permitting our panel to make their comments.

Thank you.

Senator GRAHAM. Thank you very much, Senator. Your statement, as well as all the statements of the participants today, will be fully stated in the record of this hearing.

Senator Kerry?

**STATEMENT OF HON. JOHN KERRY, U.S. SENATOR FROM THE
STATE OF NEBRASKA**

Senator KERRY. Thank you very much.

There is not much that hasn't been said at this point, but let me briefly emphasize a few key elements.

First, I want to thank the committee. This is not an easy task that you have to undertake now, but I'll tell you it is a most important task, and I think you understand that, but I just want to underscore it.

The final remark of Senator Kennedy bears further comment as we reflect upon the goals of the Clean Water Act and the road we have travelled.

In the 1970's and in the 1980's, we had anywhere from 50 to 80 percent federal participation to assist communities in the effort to upgrade major water treatment facilities and sewer projects in America. For various reasons, none of which anybody can do anything about today—court disagreement, siting dispute—the money was not shared in during those 1970's and 1980's in Boston. Moreover, Boston never had a primary treatment plant.

So Boston is starting from scratch here. It has to build the primary and the secondary treatment facilities as well as the combined sewer overflows and other water projects that go with it.

The very simple fact remains that this is not just a Boston problem. This is a problem in all of the United States where the partnership that once existed has broken down and disappeared. We are not going to have the capacity to build a consensus in this country for reauthorizing the clean water or safe drinking water acts, or for most of the environmental cleanup efforts, unless that partnership is reestablished.

Whereas most of the communities in this country got anywhere from the 50 percent to 80 percent I talked about in federal support, Boston, at the end of this project, at the current rate of participation, will receive just 8 percent. That's 8 percent partnership for a Federal mandate, court-ordered completion schedule that is going to require a ten-year span of citizens to make up for 100 years of use and provide for the next 100 years of use.

It doesn't make sense.

But not only does it not make sense; it is not doable. As the headlines indicate, you've got a daily fanfare of discussion on all of our talk shows and in all our newspapers. You can't go out to any meeting without meeting headlong a rightful—not a misplaced—sense of anger. This is a rightful sense of anger. You've got people who are concerned about having their water shut off. You've got water being shut off in some places because it is the only means of enforcement.

So we have a major predicament. President Bush tried to address this for years. We had \$100 million a year, as the Senator from Rhode Island knows and participated so much in helping secure that funding. The Senator from Florida understands that. But now we continue to struggle.

The Clinton Administration wants to follow through with its \$100 million pledge for the coming fiscal year, but the authorization needs to be there. So there is the immediate problem of the authorization for \$100 million.

But even with the \$100 million schedule, I want to reiterate we come out at just 8 percent Federal participation, which is simply not enough for a complete overhaul that takes you over \$3.5 billion for the treatment and another \$2 billion-plus for the combined

sewer overflow and your other water projects that go along with it, for a total of \$5.7 billion or so.

So we really do need to get help. We in Massachusetts have helped many citizens in other parts of the country with hundreds of other projects over the years. If we are going to maintain support for major Federal projects and for the larger interests of the Clean Water Act, it is going to be imperative to find a way to reestablish that partnership now.

These 81 communities, which represent 2.5 million people of our 6-plus million population, are really seeing the fabric of our community torn apart.

What is happening is families that can't make it are saying, "We can't live here," or "Maybe we ought to go somewhere else." That rips at the whole structure of our community and at people's sense of the future and their optimism. I know the Senators understand that.

So we implore this committee to help us to find a way to reestablish that partnership, and to do not just what needs to be done for Boston, but what needs to be done nationally as other communities face the same kind of problems all across this country.

Senator GRAHAM. Thank you very much, Senators. We appreciate both of your eloquent statements.

Lieutenant Governor Cellucci?

STATEMENT OF HON. A. PAUL CELLUCCI, LIEUTENANT GOVERNOR, COMMONWEALTH OF MASSACHUSETTS

Mr. CELLUCCI. Thank you very much, Senator Graham, Senator Chafee, Senator Durenberger, Senator Boxer.

I, too, appreciate the opportunity to testify before this committee today, particularly on a panel that is so well represented with the distinguished Senators from our State, Senator Kennedy and Senator Kerry.

On behalf of Governor Weld and the Commonwealth of Massachusetts, I would first of all voice our strong support for the legislation, S. 1114, that we would like to see enacted in this session.

Since the passage of the Clean Water Act in 1972, the Nation has seen a vast improvement in the quality of our water resource. But the effectiveness of the act has been diminished as we discover the true toll of environmental threats such as nonpoint pollution not envisioned in the act, and witnessed the promise of pollution prevention technologies only recently devised.

As we know only too well in Massachusetts, the cost of clean water has become staggering for ratepayers and governments, alike. Here, too, the funding provisions of the act no longer serve their intended purpose.

The Baucus/Chafee bill is an excellent vehicle, we believe, for addressing these water quality problems and opportunities.

Most importantly for Massachusetts ratepayers, the bill will help relieve some of the extreme financial pressures that are expected to boost the average water and sewer rates, as has been mentioned, in the Boston metropolitan area to over \$1,000 per year per household by the year 2000.

I can't over-emphasize the hardship that this will impose on the citizens of the metropolitan area, on families, on elderly. It will force many citizens to lose their homes.

The proposed \$2.5 billion authorization level for State revolving fund capitalization is desperately needed.

And while we'd like to see the SRF pie even get larger, we see greater equity in how the bill proposes to allocate the slices—that is, according to a formula based on actual documented water project needs rather than population—for example, additional assistance for communities like Boston, where there are very high capital costs associated with providing for secondary treatment.

We believe that provision should be phased in rapidly to deal with the fact that, relative to other States, Massachusetts has project needs that are disproportionately large.

We also recognize that the State has a significant role to play in these financial pressures. In this regard, I'd like to inform you that Governor Weld just signed into law a ratepayer relief appropriation of \$30 million in the fiscal year 1994 budget. We will also ensure that the State SRF is adequate to capture all available Federal dollars on an ongoing basis.

In addition, our administration has initiated a rigorous audit to review the Boston Harbor project to identify possible areas of cost savings.

But the main point that I would like to make today is that, while the State can do many things to help soften the blow to ratepayers, the magnitude of the cost associated with required water treatment projects far exceeds the capacity of the State government or the ratepayers to bear them. Substantial Federal relief is necessary, both in terms of funding and in terms of increased flexibility.

Beyond the SRF, President Clinton has requested \$100 million for the Boston Harbor cleanup. Senator Kennedy and Senator Kerry have filed a bill that would allocate \$200 million a year for the next five years for the Boston Harbor cleanup.

That magnitude of relief is desperately needed if we are to provide assistance not only to our ratepayers, but continue to improve the economy of Massachusetts.

We recognize that in the Baucus/Chafee bill there is flexibility in using SRF monies where they can be put to best use in protecting water resources. This means that, in addition to the traditional water treatment works projects under the provisions of the bill, we would be able to obtain infrastructure funding for combined sewer overflows, stormwater control, nonpoint pollution control programs, and other effective measures.

We think that's the way to go.

I have submitted written testimony that has other details.

The other point I would make—and I'm sure Doug MacDonald will make it—is this project is well underway. All you have to do is go out and visit Deer Island, as I have recently, and the primary treatment facility is well underway. This is a project that we are committed to. We are committed to cleaning up that harbor, but we need a little help and we hope that the Congress can provide it.

Thank you very much.

Senator GRAHAM. Thank you very much, Mr. Lieutenant Governor.

Before we turn to Mr. Doug MacDonald, a schedule point.

We have now completed all of the panels but for two persons who were on panel eight, Mr. Tom Behr, the Deputy Mayor of San Diego, and Ms. Judith Espinosa, New Mexico Environmental Department Cabinet Secretary.

When we complete this panel, we will hear from those two remaining witnesses.

Senator Boxer is here. She has a statement relative to the situation in San Diego. To our two colleagues, I know the pressures of your schedule. We appreciate your staying with us. Whenever you need to go to your next responsibilities, you are welcome to do so.

Senator CHAFEE. Mr. Chairman, I would just like to express our appreciation to Senator Kennedy and Senator Kerry for coming and outlining this situation.

My own view is that there is no point in replaying what took place in the past. Let's look and see where we are now and see if we can do something about it, and so I thought their testimony was very effective, and that of Lieutenant Governor Cellucci.

Senator GRAHAM. I share those remarks. I also correct myself. Ms. Judith Espinosa in fact made her statement while I was at the vote, so we have one remaining witness, Deputy Mayor Behr, who we will hear from at the conclusion of this panel.

Mr. MacDonald?

**STATEMENT OF DOUG MacDONALD, EXECUTIVE DIRECTOR,
MASSACHUSETTS WATER RESOURCES AUTHORITY**

Mr. MACDONALD. I thank you, Mr. Chairman.

Senator CHAFEE. Mr. Chairman, if I might interrupt, I have read Mr. MacDonald's testimony, and appreciate and will review also what he says. Unfortunately, I have to go now.

I want to thank particularly Lieutenant Governor Cellucci. He has been a very effective Lieutenant Governor of his State. We are neighboring States, so we hear about his activities up there. He is doing a splendid job, along with Governor Weld.

Mr. MacDonald, I look forward to reading any other comments that you might have and regret that I have to leave.

Mr. MACDONALD. Thank you, Senator.

Senator GRAHAM. Mr. MacDonald?

Mr. MACDONALD. Mr. Chairman and Senators, as the Director of the agency that is charged with this project, I would just like to make a couple of comments to expand on my written statement that I have submitted and to reinforce several of the points that have been made here.

From the standpoint of having the opportunity to talk to this committee, which has had a long interest in this project, I think the most important thing we have to say is: Boston got the message.

It got the message that the recalcitrance, the history to which the Senator has just referred to, is over. And today on Deer Island we will spend about \$3 million in construction on this project. It will be another \$3 million tomorrow. In the course of this fiscal year, \$500 million will be spent, embodying the commitment of our agency to comply with the Clean Water Act.

The rate shock problem which you have heard from bipartisan testimony before you today is very, very real, and it has the capability of crippling our compliance program.

Many excellent things have happened. Through the assistance of Senators Kennedy and Kerry we have the proposed appropriation. We have the State contributing to this effort, which the Lieutenant Governor has spoken of and which we are very pleased. S. 1114 also shows great leadership and responsive ties to people like ourselves who are in the environmental business.

I would like to suggest just three or four things that would help us deal with our specific situation that has been described in my testimony.

First, we really do need help with the authorization that must be obtained before the end of March in order to release the appropriation that was included in the Clinton Budget. We would be very grateful for your committee's assistance in insuring that authorization language is included in this bill.

Second, we believe that S. 1114 should include a special program of grant assistance to communities with very high capital costs and skyrocketing rates that is the result of compliance efforts to meet secondary treatment requirements under the Clean Water Act. We would welcome the addition of that kind of element to your bill.

Third, we need a higher level of funding for our project and others similarly situated. This is never going to be a Boston-only problem, and I think we see this increasingly across the country. We would be very grateful for your assistance in following the lead of Senators Kennedy and Kerry in Senate 350, in which they have suggested a total appropriation for our program on the level of \$200 million annually over the next five years.

If that were done, it would bring the total level of Federal participation in our Clean Water Act compliance program for Boston to about 32 percent—hardly large by the scale of what other cities and areas around the country have received.

Fourth, we hope that the needs formula that is developed in the bill can look to the present and the future, look to economic situation and rates, as well as simply the scale of needs, and can be cost-effective in the way it delivers Federal assistance to communities like ours which need your help.

From our standpoint, there is nothing that I, as the director of the agency, and we in Boston want to do more than finish the compliance efforts that we have begun. I hope that you can appreciate the challenges we face and our pledged that we have had an opportunity to tell you about our project and persuade you of the vigor with which we are moving forward. But we really have to say to you, "Please don't abandon us now."

Our community is making a significant fiscal investment to make this happen. Even with the levels of effort that we have talked about today, we would still be funding 65 percent of the project. But for us to continue and not to see the project shipwreck on these rate issues which have now become so problematic in our communities, we would very much like to ask for your assistance in any way you can along some of the lines that we have suggested or others.

I might also say that inasmuch as we are, like so many other people who speak to you, people who are in the wastewater business generally, if there is any other topic or issue apart from our specific situation where we can be of help to you and your staff, we would very much like to be called upon and render you any assistance we can from how we see the issues at the local viewpoint.

Thank you.

Senator GRAHAM. Thank you, Mr. MacDonald. I appreciate your testimony today, as well as the Lieutenant Governor and our two colleagues. I appreciate the long-term commitment that each of you has made, and what is being asked of the citizens of Boston now to meet this challenge.

We will be very mindful, and I hope a very contributing partner in that coalition which you have all spoken of as being necessary to solve this local issue but with very great national implications.

Mr. MACDONALD. Thank you very much.

Mr. CELLUCCI. Thank you, Senator.

Senator GRAHAM. Thank you.

Mr. Tom Behr, Deputy Mayor of the City of San Diego.

Mayor, we have been joined by a very distinguished member of this committee who has made a great impact in her first months of service in the United States Senate, particularly on environmental issues. Senator Boxer I understand has an opening statement.

Senator Boxer?

OPENING STATEMENT OF HON. BARBARA BOXER, U.S. SENATOR FROM THE STATE OF CALIFORNIA

Senator BOXER. I do. Thank you so much, Mr. Chairman.

It is within the five-minute rule.

I want to welcome Deputy Mayor Behr to Washington. I want to thank you, Mr. Chairman, for allowing me to address and for him to address the subcommittee on a subject that is very important to San Diego, which is the second-largest city in California and the sixth-largest city in America.

I think it is an issue that we can work on that will be fairly easy to solve. I really do believe this. We are not asking for funding. This is kind of a different issue.

So if you will allow me, let me give you a brief overview.

I wanted to state to the Deputy Mayor and to you that I am at this point 30 minutes late for a health care meeting, so if I leave you with the Deputy Mayor, will you take good care of him? And then I'll run off because the First Lady is there and I feel like I should be there.

Senator GRAHAM. We will give to the Deputy Mayor the same level of hospitality and good treatment that we have given to everyone else.

Senator BOXER. That sounds like a very good promise.

Mr. Chairman, it is reauthorization of the Clean Water Act, Congress will determine whether San Diego will be required to spend over \$1 billion to meet a standard that the experts say offers no measurable environmental benefit. Let me repeat that.

At this point, San Diego is being asked to spend \$1 billion under the Clean Water Act. If we don't change it and make it more flexi-

ble, they will spend \$1 billion, and the experts say it won't make any difference to the water quality. This is a very important point.

To give you a little bit of background, because I know Deputy Mayor will give you a lot of background, San Diego is in a unique position both geographically and environmentally. Situated a few miles from Tijuana, Mexico, the city has been put in the difficult situation of having to treat waste coming from both sides of the border.

While we now have a Federal program in place to pay for the construction of a sewage treatment plant in Tijuana, for years San Diego has borne a tremendous financial burden as a result of its location near the border.

San Diego is also located along the Pacific Coast, as you know, at a point where the outer continental shelf is very narrow and the ocean gets very deep within a very short distance from the shore.

The ocean water is cold all year and, of course, it gets colder the deeper you go. I make these points because it impacts on its treatment of the water.

The city is currently treating its wastewater to an advanced primary level before releasing that wastewater into a 2.5 mile long ocean outfall, which is currently being extended two additional miles to a depth of 320 feet. So they are extending this outfall.

But under the current Clean Water Act, San Diego is required to treat its wastewater to a secondary level, not an advanced primary but to a secondary level.

I have been advised by scientists from the University of California's Scripps Institute of Oceanography that 25 years of data show that there is no environmental damage to the marine environment from the existing outfall. Let me repeat, no environmental damage to the marine environment from the existing outfall. That's the University of California's Scripps Institute of Oceanography making that point.

Apparently, the great depth and cold temperature of the water create a situation found in few other places in the country. The extended outfall will provide even greater environmental protection. But if we don't change the Clean Water Act and make it more flexible, it is going to cost San Diego \$1 billion—more than \$1 billion—to bring its waste treatment from advanced primary to secondary.

Now, in closing—and I'll put the rest of my statement in the record. I don't think I need to talk on and on—the bottom line here is that I think that if you looked at environmental records of people in the House and in the Senate, I was listed as number one in the House, and I'm hoping to match that in the Senate.

But, to me, to make a city that is so strapped, as all our cities are, spend money—\$1 billion, plus—and get no environmental benefit is an outrage.

I know, Mr. Chairman, you are a pragmatist and an environmentalist, as I am, and I hope we can work together on this because we don't want to hurt our cities unnecessarily. Believe me, if I believed that this would make everything better and safer and more environmentally sound, I would be here leading the charge fighting to get money for San Diego to help them do it.

But experts tell us that we are doing just fine with the plan that they have in place, and I hope that we have it within our power—I know we do. I hope we have the wisdom to move to allow them to continue their plan without having to spend this additional money.

Thank you very much for this chance to talk at you, and I will work with you as this process goes forward. You are doing an excellent job. We appreciate your caring about the cities of our great country.

Senator GRAHAM. Thank you very much, Senator. I appreciate your statement and the clarity with which you have outlined the issue facing the city of San Diego. We look forward to hearing from the deputy mayor.

Now that you have attended to the financial health of the city of San Diego, will you take equally good care of our physical health with the First Lady?

Senator BOXER. I will try.

STATEMENT OF TOM BEHR, DEPUTY MAYOR, CITY OF SAN DIEGO

Mr. BEHR. Mr. Chairman, I know I will be in good hands today, just as the city of San Diego is in good hands with Senator Boxer's support on this specific issue. I, too, would not be here if I felt we were harming the environment.

Thank you very much for inviting me to testify.

I would say, notwithstanding that I am a transplanted easterner, having canoed for days on end on the Susquehanna to go back to my home town of Binghamton, New York, and having played and fished in the Chesapeake Bay when I worked here in Washington a lot of years ago, notwithstanding that, I do want to thank you for saving the best for last. That's not me, but that's the State of California and specifically California's crown jewel, the city of San Diego. I hope that you come out and visit us some time.

There are two requests that I make to your committee.

The first is that the Clean Water Act bill be written to allow the city to continue to use advanced primary treatment where there is a deep ocean outfall which provides the equivalent environmental protection of secondary treatment.

The second is that wastewater reclamation be in capital improvement or distribution systems, be eligible for funding under title six of the act.

We look at the San Diego region as a broad ecosystem where we face a variety of water quality threats from nonpoint source runoff, as the Senator said, from Mexican sewage flowing across our border, and from a need to enhance our long-range drinking water supply.

It is very important to our residents that the act allow the city to utilize its scarce funds to protect the environment by continuing the use of our Point Loma advanced primary treatment facility in conjunction with its deep ocean outfall, and an ambitious wastewater reclamation program.

Unfortunately, the existing act does not allow for the city to make the best use of resources. The act ignores sound science, it ignores regional differences, and it ignores new technology for treating sewage.

The existing law will cost San Diego ratepayers an additional billion dollars, not even including the financing charges to accomplish full secondary.

However, with a deep ocean outfall there is no demonstrable difference in environmental impact between secondary treatment effluent and San Diego's present advanced primary treatment effluent.

We have an ocean floor that slopes steeply, accessing cold, deep marine waters within a few miles offshore—an open coast, swift currents, and dynamic mixing. We also have in place the technology needed to ensure environmental protection.

Our state-of-the-art advanced primary treatment plant at Point Loma discharges in 220 feet of water over 2 miles off shore. Our new outfall extension now under construction will discharge even farther off-shore—as the Senator pointed out, 4.5 miles into 320 feet of water.

This extension will make the outfall the longest and deepest reinforced concrete structure in the world.

San Diego has monitored the effects of the existing advanced primary discharge on the marine environment for over 25 years and has found that there is no significant impact, and that's corroborated by Scripps Oceanographic scientists.

In the EPA's 1991 Federal lawsuit against San Diego, the court considered a significant amount of evidence submitted by the country's best scientists—ours and yours—and found that there is no adverse impact. That is a validated judicial finding.

Additionally, the National Academy of Science's April report confirms what San Diego has been saying for years—advanced primary treatment is appropriate for San Diego's deep ocean environment.

The report provides a scientific foundation for you and for Congress to protect the coastal marine environment by amending the Clean Water Act to reflect regional science and geography.

In regard to water reclamation, San Diego has caught its potable water demand through an extensive conservation program. A 20 percent reduction has been achieved.

And I have to note that in discussions about the arid States and 12.5 or 15 inches of rain, San Diego has an average rainfall of 9.5 inches, which is why we import more than 90 percent of our potable water needs.

We now look to water reclamation as the next major step and think that it should be considered in the amended act. Reclamation is a tool for wastewater management because it is folly to dump treated effluent in the ocean when it can offset demand for potable water.

We have a long-term strategy for wastewater treatment and reuse and environment protection, and it is called the consumers' alternative. That is underway, and that's a committed cost of \$1.8 billion without the cost of financing added. That does not include a \$1 billion upgrade to secondary at Point Loma.

The major element of our program is a new 30—expandable to 55—NGD wastewater reclamation plant at a cost of \$166 million. That plant is under construction today.

I mentioned earlier my concern over significant cost if amendments do not include consideration of our unique circumstances. It is even more of a burden when you realize that because San Diego meets the State ocean plan we have a low priority for SRF loans.

In addition, from 1970 to 1986 we have received just \$95 per capita grant funding, only 25 percent of the Statewide average. From 1987 to today we have received just \$30 million. Consequently, 99 percent of the costs that I have described will be paid for by local ratepayers. That can't be what Congress intended when it passed the Clean Water Act in 1972.

In conclusion, Mr. Chairman, San Diego has a strong wastewater management program that includes treatment, construction, conservation, and reclamation at a cost of \$1.8 billion. It is critical that your clean water legislation provide San Diego with a framework to protect our precious coastal waters without spending an additional billion dollars plus on treatment facility upgrade that provides no discernable additional benefit to the environment—a point that I think Senator Boxer has made several times for you.

Thank you for the opportunity to be here today.

Senator GRAHAM. Thank you very much, Mr. Mayor.

Let me ask a couple of questions.

Coming from a State which has also faced the issue of the level of treatment required to discharge effluent, but recognizing that our situation in relatively shallower waters and warmer waters may be different, is your situation one in which the Environmental Protection Agency is requiring you to install secondary treatment and you feel that either EPA does not have sufficient flexibility to take into account your special circumstances or, having that capability, EPA has chosen not to do to?

Mr. BEHR. In my dealings—and they have been extensive—with the EPA, I do feel that they have shown a great deal of interest in understanding, but I think it is more the former that you were pointing out—the lack of flexibility.

The may certainly not want to admit it, although it has been said in various means and testimony that we have not been harming the environment. We are still under litigation with EPA, almost to the point I would consider it harassment. But the fact that we have the equivalent of the environmental protection of secondary has been our position all along, as justified or not, but the things I have mentioned to you. That, under the present act, is hard for the EPA to accept at this point.

Senator GRAHAM. What is the current state of your litigation with EPA?

Mr. BEHR. We have a consent decree that we had entered into with the EPA in January of 1990 that the judge has not entered. That consent decree is looked upon as a living document by the judge and by us. It has provisions for changes to it. And it is not in a stay pattern by the judge as we go through further testing at Point Loma to see whether additional solids can be removed. It also provides within the consent decree legislative relief which would then change the terms of the consent decree and the impositions placed on San Diego.

Senator GRAHAM. You mentioned your interest in recycling—an interest that I applaud. Will you be able to do recycling with ad-

vanced primary treatment, or will that require additional levels of treatment?

Mr. BEHR. No. The reuse/recycling that I was referring to was reclaimed water through the tertiary level. In California we still have the situation of State requirements not making such water totally available, say like the Lower Occoquan Reservoir, which has additional levels of tertiary treatment. We are contemplating yet still we would require tertiary treatment and then be able to use it for agriculture, for injection in aquifers, and/or for irrigation purposes throughout the city.

But that comes with a rather large, rather substantial price tag. That is what I was also addressing in my remarks to you.

Clearly for us one of the long-term benefits if we can all invest in reclaimed waters through the tertiary level and use it hopefully at some point for all purposes—certainly at least now for those purposes other than for drinking water. That's not only San Diego, but would be any arid area of the country.

Senator GRAHAM. Mr. Mayor, I appreciate very much your coming this long distance to share with us the special circumstances of San Diego. I would agree with my colleague that yours is one of the beautiful cities of America. I appreciate your invitation to visit, which I have been able to do on a number of occasions in the past and look forward to doing so in the future.

Mr. BEHR. Thank you for your consideration. I just hope that you do and the other members of the committee, and Congress understands the unique situation of deep-ocean dischargers like the city of San Diego. We welcome you there and hope that you bring in hand the appropriate amendments to the Clean Water Act that will make us all very happy.

Senator GRAHAM. The first time I went was to visit the zoo. The next time was to visit the wastewater treatment plant.

Mr. BEHR. I would also ask—I'll submit this to staff. I have my formal comments for the record in addition. I don't believe they were attached. I talked to Bill. The Union Tribune, our local paper, has a very concise editorial on the Clean Water Act and its impact on San Diego, and I'd appreciate being able to get that—

Senator GRAHAM. All of the materials that you would like to submit will be included in the record. There also were previous witnesses who had materials, including Congressman Laughlin, who was unable to appear. Those statements will also be part of the record.

Senator GRAHAM. If there is no further testimony, the meeting is adjourned.

[Whereupon, at 1:14 p.m., the subcommittee adjourned, to reconvene at the call of the Chair.]

[Statements submitted for the record follow:]

TESTIMONY OF DAWN M. MARTIN, AMERICAN OCEANS CAMPAIGN,
WASHINGTON, DC

INTRODUCTION

Good morning, my name is Dawn Martin and I am the Director of the Washington Office for the American Oceans Campaign (AOC) and the Coordinator for the National Coastal Caucus (NCC). AOC is dedicated to conserving and enhancing our

nation's oceans and coastal resources.¹ The NCC is a coalition of regional environmental organizations working collectively to fight pollution in our oceans, estuaries, bays, beaches, and wetlands.² On their behalf, I wish to express my thanks to Chairman Graham (D-FL) for inviting us to testify and for all the work he and the Committee staff have done in scheduling this very comprehensive series of clean water hearings. In addition, I applaud Chairman Baucus (D-MT) and Senator Chafee (R-RI) for introducing S. 1114, which has served as the vehicle for discussion in these hearings. Attached to my testimony are two letters of support from the NCC on legislation that I will discuss in my testimony. I request that the Committee include these letters in support of S. 815, the Water Pollution Control Estuary Restoration Act, and the S. 997, the Beaches Environmental Assessment, Closure and Health Act as part of the record for this hearing.

Since the original Federal Water Pollution Control Act (Clean Water Act) was signed into law its provisions have been revised on numerous occasions. With each reauthorization, Congress has strengthened efforts to protect our coasts from pollution. Once again you are faced with this daunting task, and we believe that the time is right to implement even greater protections. The critical state of our National aquatic ecosystems and our global environment demand the immediate attention and help of the 103rd Congress.

Citizens of this Nation are becoming increasingly aware of our earth and its abundant, yet limited, resources. *According to a recent Gallup poll, approximately two-thirds of the U.S. public are "greatly concerned" (the highest rating) about the contamination of drinking water, and pollution of lakes, rivers, and beaches.*³ Even in light of the extreme financial restrictions currently facing our state and federal treasuries, the public has consistently called for increased environmental protections, while acknowledging the high cost of some of these programs. Similarly, the Wirthlin Group conducted a poll last July and discovered that 80 percent of Americans think "protecting the environment is so important that requirements and standards cannot be too high, and *continuing environmental improvements must be made, regardless of cost.*"⁴ And finally, the election of President Clinton, Vice-President Gore and the overwhelming victories at all levels of government of those who ran their campaigns on an environmental platform, indicate the high level of concern people of this nation have for protecting the environment.

Clearly, citizens of this country understand the potentially disastrous short and long-term environmental, social, and economic costs of delaying environmental protections. Realizing it is more costly to tackle environmental problems with a Band-Aid approach, the public desires and deserves a comprehensive and strategic planning process that protects its natural resources and is aimed at cleaning up and preventing pollution from occurring in the first place. This theme will guide me in my remarks today.

The primary focus of my testimony will be on the National Estuary Program and the strengthening language proposed by Senator Lieberman (D-CT) in S. 815, and I will be speaking in support of the beach protection legislation as offered by Senator Lautenberg (D-NJ) in S. 997.

PROTECTING AQUATIC ECOSYSTEMS THROUGH A WATERSHED APPROACH

A fundamental goal of the Clean Water Act is to maintain and restore the physical, chemical, and biological integrity of the nation's waters. During the past twenty years, however, the Environmental Protection Agency (EPA) has dedicated much of

¹ AOC is a non-partisan, non-profit organization founded in 1987 and dedicated to the restoration and preservation of the world's oceans. Our efforts are rooted in the premise that the earth's environment is dependent upon healthy oceans. Our mission is to work to protect the vitality of coastal waters, estuaries, bays, wetlands, and deep oceans. We accomplish this goal by educating the public and decision makers on the need to protect our marine resources. We focus on strengthening public policy to protect our marine resources, and we believe that strong grassroots input and sound/scientific information are the key ingredients to making effective public policy.

² Earlier this year, the AOC convened a gathering of geographically diverse, regional environmental organizations with solid reputations for being highly effective. As a result of that meeting the National Coastal Caucus was formed. The purpose of the NCC is to build a strong and united voice of coastal experts, committed to the enactment of strong national coastal pollution legislation. Our first effort is focused on the need to strengthen the Ocean Water Act. The positions taken by the NCC are based on the experience and expertise of these groups who have implemented and enforced the Sea Water Act at the local level.

³ *Americans Report High Levels of Environmental Concern*, Activity Graham Hueber, The Gallup Poll News Service (April, 1990).

⁴ *Environmental Concern Still High after Rio Summit*, Christine Keilpinski, The Wirthlin Group and Susan Wysoki, Hill and Knowlton; the Wirthlin Report (July 1992).

its resources to the development of criteria addressing the chemical integrity of the nation's waters, primarily because wastewater management was treated as a public health concern. As a result, little attention has been paid to the physical and biological impairment of these waters.

EPA's focus on reduction of chemical inputs and concentrations in the nation's waters has resulted in considerable progress toward controlling and reducing specific types of chemical discharges. However, it is time for the CWA to explicitly address the restoration and protection of aquatic ecosystems, recognizing that the biological integrity of the nation's waters stands on equal footing with human health risk assessments. It is critical that water quality standards use biological criteria to protect water-dependent wildlife and ecosystem health.

"Aquatic ecosystems worldwide are being severely altered or destroyed at a rate greater than that at any other time in human history. . . ." ⁵ Protection of the functions of aquatic ecosystems such as pollution control, fisheries and wildlife support, floodwater storage and groundwater recharge have been largely ignored. Historically, resource management has been fragmentary in its approach and has focused on artificial boundaries (such as local, state, or country borders) when dealing with protection of our natural resources. This type of strategy focuses on specific programmatic issues with little consideration of the effectiveness of such actions on maintaining or improving the condition of the ecosystem as a whole. Often times, priority issues are defined by the availability of programs rather than by the specific need of the watershed in its entirety. We are pleased to see that this Committee has acknowledged the clear hydrological, ecological and economic basis for focusing on broader aquatic ecosystems management approaches, through its watershed planning provisions in Title III of S. 1114.

Watershed planning, however, is not a completely novel concept. Attempts have been made at the local, state, regional and federal level to do successful watershed planning for many years. Obviously, some of these efforts have been more effective than others. Created by Section 320 of the 1987 Clean Water Act, the National Estuary Program is an excellent example of a workable model for comprehensive aquatic ecosystem and watershed management. The early NEP incorporated the lessons learned in the Great Lakes and Chesapeake Bay Programs. Since then, the experiences gained by the first estuaries designated into the program—Puget Sound, Buzzards Bay and Narragansett Bay—have provided valuable lessons and serve as a model for the other Management Conferences as they develop and implement their CCMP's. As new information and technology are developed, the NEP will continue to evolve.

NATIONAL ESTUARY PROGRAM

Estuaries form transition zones between freshwater and marine ecosystems and, as a result are among the most productive natural systems. In these unique bodies of water, fresh water drains from the land and mixes with salt water from the sea. This valuable estuarine habitat is especially crucial to the early development of marine fisheries, shellfish, and birds. As a result, maintaining the health and viability of estuaries is critical to the biological life cycles both of marine organisms and wildlife.

Society also places a high value on estuarine areas as places for living, working, and recreating. However, the natural beauty and bounty of these ecosystems is partly the cause of their decline. People are drawn to their shores because of their unique qualities, yet, with people comes coastal development—housing, roads, business, industry, and cars—which threatens the existence of these valuable ecosystems. Today, estuaries are among the most densely populated areas—almost half of the entire U.S. population (about 110 million people) reside in coastal areas. ⁶ As a result, they are one of the nations' most highly stressed natural systems.

In spite of their high value, intense use and frequent overuse, estuaries only recently have been recognized as a unique and severely depleted resource requiring special attention. Congress determined that the problems confronting these estuaries were too complex to be adequately addressed by the traditional water pollution

control programs. In response, they authorized the National Estuary Program (NEP) under Section 320 of the Water Quality Act of 1987.

The NEP is designed to identify estuaries of "national significance" and to establish a process for improving and protecting their water quality, habitat and living resources. To determine how to achieve these goals EPA is required to convene a Management Conference that has the responsibility for developing a Comprehensive Conservation and Management Plan (CCMP) within a five year time-frame. Participants in the Management Conference include representatives of the relevant federal, state and local government agencies and elected officials, industries, businesses, academic institutions, interest groups and citizens.

The CCMP is intended to address all uses affecting the restoration and maintenance of the chemical, physical, and biological integrity of each estuary. It includes many complex issues, such as habitat protection, polluted runoff controls, resource management and land-use planning, and will probably take decades to meet its challenge. However, the NEP has already taken important steps forward and is on the way toward meeting its goals. However, as it is currently structured, the NEP can only be expected to reach a limited level of success. The biggest obstacle to the success of the program lies in the fact that implementation of the plans is stymied by an inadequate federal financial commitment to the program.

The NEP has four tiers. *Tier I* was convened in 1985, 1986, and 1987 and includes the following six estuaries: Puget Sound, Buzzards Bay, Narragansett Bay, Long Island Sound, Albemarle-Pamlico Sounds, and the San Francisco Estuary. *Tier II* was convened in 1988 and includes New York-New Jersey Harbor Estuary, Delaware Inland Bays, Santa Monica Bay, Sarasota Bay, Galveston Bay, and Delaware Estuary. *Tier III* was convened in 1990 and includes Casco Bay, Massachusetts Bays, Indian river Lagoon, Tampa Bay, and Barataria-Terrebonne Estuarine Complex. In 1992, four estuaries were designated but will not be convened until their respective Conference agreements are signed. These estuaries, comprising *Tier IV*, include Corpus Christi Bay, Peconic Bay, San Juan Bay and Tillamook Bay.

Of these twenty-one estuaries, the Puget Sound Estuary Program, which was convened in 1985, was the first to have its Comprehensive Conservation and Management Plan approved by EPA. Last year, CCMPs from Buzzards Bay and Narragansett Bay were approved. Long Island Sound has submitted its draft final CCMP for public review and its final CCMP is expected in January, 1994.

PROBLEMS AND PROPOSED SOLUTIONS WITH THE NEP

For the past several years, AOC through the National Coastal Caucus (which is comprised of representatives of citizens organizations involved in their local estuary program), has been gathering comments on the strengths and weaknesses of the NEP. As a result of the combined efforts of each of these groups, we developed a list of priority problems and potential solutions necessary to strengthen the NEP. These suggestions essentially became the basis of Senator Lieberman's Water Pollution Control and Estuary Restoration Act, S. 815.

The organization's involved in the NCC have worked on developing and implementing the CCMPs from the following estuaries: Albemarle/Pamlico Sounds, North Carolina; Barataria-Terrebonne Estuarine Complex, Louisiana; Buzzards Bay, Massachusetts; Casco Bay, Maine; Chesapeake Bay, Maryland, Pennsylvania, and Virginia; Columbia River, Oregon; Delaware Estuary, Delaware, New Jersey, and Pennsylvania; Delaware Inland Bays, Delaware; Galveston Bay, Texas; Gulf of Mexico Program, Texas, Louisiana, Mississippi, Alabama, and Florida; Indian River Lagoon, Florida; Long Island Sound, Connecticut and New York; Massachusetts Bays, Massachusetts; Narragansett Bay, Rhode Island; New York-New Jersey Harbor Estuary, New York and New Jersey; Puget Sound, Washington State; San Francisco Estuary, California; Sarasota Bay, Florida; Santa Monica Bay, California; Tampa Bay, Florida.

Last July, these activists, representing millions of constituents in nineteen different states, met in Seattle, Washington near Puget Sound, to coordinate a national strategy to strengthen the National Estuary Program. In order to help in this effort and to build the necessary political will to encourage such changes, the participants of the estuary meeting reviewed and agreed to actively support the provisions of Senator Lieberman's (D-CT) bill, S. 815. These local and regional environmental activists from around the country said that if S. 815 was passed into law it would do much to preserve and restore our nation's estuaries, as well as to significantly improve the current program.

One of the points highlighted by the activists was that S. 815 recognizes that estuaries are a vital resource to which many regional economies are closely tied. The legislation acknowledges that investing in healthy estuaries is, in fact, investing in

jobs and a healthy economy. According to information provided in a March, 1992 study by Apogee Research, Inc., S. 815 would create 800,000 to 1.4 million new jobs during the seven year life of the bill in the construction industries and industries that support these workers. In addition to the NCC, another very broad based coalition has evolved in support of this bill, The Clean Water Jobs Coalition. Mr. John Atkin, who is sitting on one of the next panels of witnesses will highlight the strength of this coalition.

Clearly, a general consensus exists that the basic structure of the NEP is sound and worthy of whatever efforts necessary to improve the program. However, it is also clear that those involved in the program have experienced similar types of frustrations across the country, and therefore, are calling for a national solution to address these problems. We believe the solution can be found in S. 815 and we ask you to include it in the Committee's version of legislation to reauthorize the Clean Water Act.

Essentially there are five main areas in which section 320 of the Clean Water Act would be strengthened by incorporating the language of The Water Pollution Control and Estuary Restoration Act (S. 815). The Coastal Protection Act of 1993 (S. 1119) introduced by Majority Leader Mitchell (D-ME) and Senator Lautenberg (D-NJ) also provides some language which would strengthen the NEP, as does the Committee's bill, S. 1114. These provisions include:

[1] Mandating implementation of CCMPs. The NEP has done an excellent job of identifying the coastal pollution problems in each of these estuaries and in developing plans to address these problems. However, after the CCMPs are completed there is no firm requirement that the plan be implemented. EPA must be given the clear authorization to provide funding and other assistance for the implementation of CCMPs. Efficient use of the resources expended in developing the CCMPs necessitates federal support for implementing, monitoring and enforcing the plan. Otherwise, all of the time, energy and money spent on planning will result in a nice document that sits on a shelf collecting dust!

S. 815 moves the program from the identification phase to implementing the solutions to the problems by clarifying that implementation of CCMP's is a non-discretionary duty of E.P.A. In addition, federal financial assistance is provided to assist in this effort.

S. 1114 amends Section 320(g) by expanding the purposes of the grants to pay for research, surveys, studies, modeling, and other technical work necessary for the "implementation" (in addition to the development) of CCMPs. Section 101 of S. 1114 also specifically provides that implementation of an approved CCMP is an eligible project for funding through the State Revolving Loan Funds (SRF).

S. 1199 acknowledges the need for federal involvement in the implementation of CCMP's by extending the authority of, and funding for, Management Conferences to oversee implementation of approved plans.

[2] Incorporating strict time-frame guidelines into CCMP development and implementation. The five year time-frame allowed under section 320(e) should not be extended simply to allow the planning process to continue. With the appropriate guidance and leadership a very detailed and comprehensive plan can be developed within five years. Such a plan should also include financial forecasts, so as to assist States and the EPA in future budgeting decisions.

S. 815 sets forth scheduling deadlines to ensure a timely planning and implementation process and to discourage individual members of the Management Conference from stalling the entire process. Within the first year a total budget must be submitted to EPA outlining the expected costs for efficient development of the plan and implementation of early action plans. It also requires that a draft CCMP, identifying the major problems and setting priorities for early action, be developed within three years. In addition, it states that action plans are to be well coordinated with the activities of other agencies. If the Management Conference does not meet the scheduling guidelines, federal funding can be terminated.

S. 1199 also adds language to tighten up the planning process by requiring that implementation plans include a detailed financial plan indicating the anticipated Federal, State, and local funds needed to implement identified corrective actions. The bill also prohibits the EPA to award grants to programs that have not received EPA approval for a CCMP, or to programs that have failed to substantially implement their plans.

[3] Increasing the role and visibility of EPA in the program. The role of the EPA, as an active participant and as a coordinator of the program has not been consistent in each estuaries nor has its level of commitment to the NEP. In addition, there is a need for EPA to issue final NEP guidance outlining the mini-

mum federal standards and requirements necessary for CCMPs to be approved. Realizing that EPA continues to suffer extreme budget cuts, we are also working with the Administration and the Budget and Appropriations Committees to encourage that EPA be considered a priority when funding choices are made. Otherwise, the staff and resources necessary to ensure the success of this program may be not be available.

S. 815 requires EPA to assist Management Conferences in ensuring full coordination with the Governor's offices and state coastal zone management agencies for implementing the requirements under the CWA and the Coastal Zone Management Act. EPA is also directed to publish and promulgate guidelines setting out criteria for development, approval, and implementation of CCMPs. Generally, EPA is encouraged to take on a more aggressive leadership role in the program.

S. 1199 also highlights the need for increased participation by the EPA by revising its research and reporting requirements. Specifically, EPA is to review more closely and report on the monitoring and pollution abatement measures taken by, and the progress of, the Management Conferences.

[4] Strengthening citizen participation. Citizen participation during the development and implementation of the CCMPs is often inadequate. Part of the reason for this problem is the lack of funding necessary to make it feasible for the public to participate in a serious manner. To ensure successful implementation of CCMPs, plans must be endorsed by and must receive continuing commitment from the scientific community, the public, elected officials, and the government agencies responsible for its implementation.

S. 815 acknowledges that public involvement is a vital function of every Conference. It expands opportunities for public comment and participation in the development, approval, and implementation of management plans. Environmental organizations are specifically identified for participation as members of the estuary Management Conferences.

[5] Include a funding mechanism to ensure implementation of CCMPs. Due to state budget shortfalls and a lack of federal support, many states have been unable to fully implement their CCMPs. As each day passes, additional stresses and burdens on state treasuries require even the most essential projects to compete for less dollars. This trend is expected to continue, therefore, it is becoming increasingly unlikely that CCMPs will ever be implemented, monitored, and enforced if left solely as a state responsibility. It is imperative that access to additional resources be provided for implementation of the plans to be successful, otherwise the federal funds expended for crafting the plans will be wasted. Federal funds also provide an incentive for states to undertake the more politically difficult task of putting the elements of the plan into practice. Under current law, states are eligible to receive CCMP implementation funds under the SRF program, however, authorization and appropriation levels are severely inadequate to meet the growing demand for funding.

S. 815 provides for a funding mechanism to ensure that the states are given federal assistance for CCMP implementation. A small grant program is established for innovative projects and interim actions that are not ordinarily funded through the SRF in Title VI of the CWA. The bill also increases funding for the SRF program at \$4 and then \$5 billion and creates a set aside specifically for CCMP implementation.

BEACH CLOSURES AND ADVISORIES

As medical waste began to wash up on our coastlines during the summer of 1988, the many problems associated with coastal pollution came to forefront of the nations attention. The media focused on the threat that toxic chemicals and marine floatable debris pose to the nation, and reported on toxic red tides, sewage spills, dead dolphins, and fishing bans. Alarming accounts explained that unseen contamination from sewage spills and polluted runoff can contain high levels of pathogens posing health threats such as hepatitis and gastroenteritis. During this period, the New York and New Jersey tourism industries lost an estimated \$2 million as a result of beach closures.

The harm caused by coastal pollution extends beyond human illnesses contracted from body contact or ingestion of contaminated seafood; it also poses risks to marine species and the economy. Though it is difficult to calculate overall total economic losses, there are indications of wide impact. For example, the sport fishing industry, which generates billions of dollars for local economies, suffers significant losses from coastal pollution. One-third of the nation's remaining productive shellfish waters are closed on any given day because of pollution. Those same pollution sources cause swimmer illness, further depressing the economy through lost work days.

In June of this year, the Natural Resources Defense Council (NRDC) released a report which inventoried the beach protection programs in 22 coastal states.⁷ NRDC discovered that over 2,600 closings and advisories occurred at ocean and bay beaches in 1992 alone! Beach water standards, monitoring, and closure practices vary widely from state to state, and within states. Eight of the 22 coastal states surveyed in the report do no monitoring of coastal recreational water's for swimmer safety despite evidence of coastal pollution problems in those states and despite the sizable revenues generated by coastal tourism. In addition, five coastal states have limited monitoring programs which apply to only a portion of their coastlines or involve infrequent (once a year) monitoring.

Because coastal tourism generates billions of dollars annually, it makes good economic and environmental sense for states to provide public health protection for coastal recreational waters. Federal guidance is needed to discourage health officials from turning a blind eye from this pollution for fear that closed beaches will deter tourists. Instead, beach-goers should be aware that beach closings indicate responsible combined efforts to protect public health. In the long term, larger coastal pollution problems—of which beach closings are only a symptom—must be addressed and a comprehensive remedy must be found.

The Beaches Environmental Assessment, Closure and Health Act (B.E.A.C.H. Act), S. 997, proposed by Senator Lautenberg (D-NJ) is a significant first step in finding a comprehensive remedy to the pollution problems of our nation's beaches and coastal recreation waters. The bill ensures that states follow uniform beach testing procedures to protect public safety, avoid health risks, and improve the environmental quality of coastal recreation waters. Cleaning up existing sources of pollution, including polluted runoff, is clearly the best and the most important remedy to the problem of beach water contamination. In the interim, however, consistent programs to adequately protect beach-goer health must be set in place. S. 997 addresses some of the deficiencies in the current sporadic approach to beach protection and provides the following improvements:

- [1] The bill requires EPA to develop health-based coastal water quality criteria for pathogens within 18 months of enactment. The criteria is to be based on best available scientific information and short term increases of bacteria and viruses resulting from rainfall, malfunctions of wastewater treatment works, or other causes. After the criteria are published, states are given three years to adopt standards that at a minimum are consistent with EPA criteria.
- [2] Nine months after EPA publishes the water quality criteria, EPA is to publish regulations specifying minimum monitoring procedures for coastal recreation waters. The regulations shall specify: a) the frequency of such monitoring based on the periods of recreational use, b) the extent and degree of such use, and c) the proximity to pollution sources. In addition, the EPA will include specific methods for detecting short term increases of pathogens.
- [3] The bill establishes procedures for mandatory public notification of water quality standards violations. Recognizing the public has a right to know about the safety of its coastal recreational waters, the bill directs prompt communication of the violations to the appropriate local government agency and requires the state to post signs on beaches notifying the public of the violation and the potential health risks associated with body contact with such water.
- [4] The bill requires EPA to issue guidance on uniform assessment and monitoring of floatable materials and to specify the conditions when the presence of floatable debris constitutes a threat to the public health.
- [5] The bill authorizes EPA and the National Oceanic and Atmospheric Administration to conduct a joint study. The study's purpose will be to develop better indicators for directly detecting the presence of bacteria and viruses which are harmful to human health in coastal recreation waters.

We strongly support inclusion of the B.E.A.C.H. bill in the comprehensive Clean Water Act reauthorization. The bill authorizes federal involvement in developing minimum monitoring practices and in establishing mandatory public notification procedures. By incorporating S. 997 into the Clean Water Act, this committee will begin to address the public's concerns about beach and coastal pollution. Minimum standards applied in every state will provide beach-goers and enthusiasts of coastal water activities with the peace of mind that they can participate in their activities and be assured their health is not in jeopardy.

SUMMARY

Assuring the development of the most efficient plan for tackling pollution problems within estuaries of "national significance" is the major theme of S. 815, The Water Pollution Control and Estuary Restoration Act. Senator Lieberman is to be commended for his focus on the economic and environmental costs associated with cleaning up these valuable watersheds. We encourage the Committee to amend Section 607 of S. 1114 to incorporate the Lieberman bill in its reauthorization of the Clean Water Act and to proceed with confidence that the public solidly supports this legislation.

The Committee's version of The Federal Water Pollution Control Act, S. 1114 can easily be amended to address some of the concerns about the NEP. First of all, we strongly support the above mentioned provisions that recognize the need for assistance in implementing the CCMPs. Additionally, we recommend linking the National Estuary Program with the watershed provisions of the Committee's bill as set forth in Title I and Title III of S. 1114.

Title I of S. 1114 creates a new allotment for watershed management and planning under CWA Section 604. We would like to see this provision amended to include approved CCMPs under Section 320, in addition to watershed planning and management under Section 321.

Title III of S. 1114 creates a new Section 321 for Comprehensive Watershed Management. Section 321(c) establishes a Management Entity that is responsible for developing and implementing a plan for each watershed management unit. We believe that this section should be broadened to permit the Management Conferences established through the NEP to function as the management entity for implementing CCMPs and therefore, be eligible for assistance under Section 321(f). Additionally, Section 321(g) should include a mechanism for an approved CCMP to be approved on an expedited basis under the requirements for a comprehensive watershed management plan. Essentially, we recommend providing national estuaries with similar incentives and funding eligibility that are given watershed plans under Title III of the proposed bill.

As mentioned above, The Coastal Protection Act of 1993, S. 1199, introduced by Majority Leader Mitchell (D-ME) and Senator Lautenberg (D-NJ) also includes provisions that will strengthen the National Estuary Program. Other important provisions of S. 1199 include the creation of a coastal environment toxics release strategy focusing on the effect of industrial discharges into marine waters, and the development of a national marine water quality education program. The bill significantly strengthens the requirements and enforcement provisions of section 312 for marine sanitation devices. It also calls for the development marine water quality criteria and standards and significantly restricts ocean discharges. Finally, it authorizes the Army Corp of Engineers to assist in the construction of facilities for the control of overflows from combined storm and sanitary sewers into marine waters.

Unfortunately, due to time constraints, we have been unable to fully analyze S. 1199. We are in process of gathering comments and will submit them to the Committee as soon as possible. Until I discuss the other provisions of the bill our activists and estuary coordinators, I hesitate to extend further comments on S. 1199.

CONCLUSION

This concludes our testimony. I hope we have assisted this Committee in its challenging task of reauthorizing the Clean Water Act. The citizens of this country are seeking a comprehensive approach to preventing pollution of our nation's estuaries, coastal waters and beaches. The proposed legislation I have discussed today will meet the public's desires. We encourage you to do all that is within your power to assure that these bills are included in the reauthorized Clean Water Act. Thank you once again for soliciting our views on this important issue. We appreciate the Committee's attention to the issues of coastal pollution.

April 14, 1993

CO-SPONSORS REQUESTED FOR STRENGTHENING CLEAN WATER ACT

Dear Senator,

The undersigned organizations urge you to co-sponsor and support the Water Pollution Control and Estuary Restoration Financing Act. to be introduced by Senator's Lieberman (D-CT) and Dodd (D-CT) by the end of April. This legislation strengthens the Clean Water Act (CWA) in several important ways. In particular, it will help clean up our nation's water resources by significantly increasing federal aid to states for upgrading sewage treatment plants, controlling polluted runoff, and fixing

combined sewer-overflows. In addition, it reauthorizes Section 320—the National Estuary Program, requires implementation of EPA approved Comprehensive Conservation and Management Plans (CCMP), and ensures full coordination of efforts taken to carry out other requirements of the CWA and Coastal Zone Management Act. The bill also targets State Revolving Loan Funds (SRF) for economically and environmentally efficient implementation of estuary management plans.

The protection of estuaries of “national significance” and other precious national resources is a top legislative priority for citizens around the country, as well as for the local economies that depend upon them for long-term economic growth. *Currently, many states and municipalities possess neither the infrastructure nor the financial resources to stop the ongoing destruction of these estuaries, therefore, it is essential that federal legislation such as this be supported.*

It is our belief that the present statutory and regulatory structure of the National Estuary Program does not adequately deal with the complexities of the problems faced by these valuable watersheds. As a result, we have worked closely with Congressional staff to ensure that this bill significantly strengthens Section 320 of the Clean Water Act and provides adequate financial resources for implementation of comprehensive management plans. *We believe that support for this legislation provides a proper balance of environmental and economic incentives to improve current law, to protect these estuaries from further destruction, and ultimately, to improve the health and quality of these watersheds.*

This bill is designed to implement estuary protection and cleanup in such a way as to create jobs and foster economic growth through commitment to a strong federal-state-local partnership. Specifically, the legislation would create a set-aside of additional funds in the SRF program to assist states in implementing approved CCMP's. Such planning is essential to assure that management programs achieve their goals and are economically feasible, before unnecessary resources are expended. This SRF set-aside will provide funds to local economies while achieving the dual purpose of protecting the integrity of their estuaries, and creating the necessary economic base essential for continued economic resiliency. *According to a March 1992 study by Apogee Research, Inc. this legislation would create 800,000 to 1.4 million new jobs over the seven year life of the bill in the construction industries and industries that support these workers.*

By becoming a co-sponsor of this important legislation you will help to lay the groundwork for addressing this issue in the reauthorization of the Clean Water Act, and ensure that our estuaries and communities thrive for generations to come. Thank you for your consideration of this legislation. Please feel free to contact us if we can be of any assistance.

Sincerely,

Dr. Robert Gray, President, Water Quality Section, American Fisheries Society; Paul Kemp, Science & Technology Director, Coalition to Restore Coastal Louisiana; Dery Bennett, Executive Director, American Littoral Society; Beth Millemann, Executive Director, Coast Alliance; Dawn M. Martin, Issues Director, American Oceans Campaign; Eugenia Laychak, Policy Director, Coastal Resources Center; Connie B. July 13, 1993

Dear Senator,

The undersigned organizations urge you to co-sponsor and support S. 997, the Beaches Environmental Assessment, Closure, and Health Act of 1993. The focus of the B.E.A.C.H bill is to ensure that States have adequate beach testing programs, to protect citizens from health risks, while allowing states flexibility in determining beach closures or in implementing stricter standards.

Current data indicate that the problem of sewage contamination and polluted runoff of our coastal waters, and its associated health risks, are persistent. There have been thousands of ocean and bay beach closings or advisories issued during in the past few years, due to elevated bacteria levels attributable primarily to human and animal waste. Cleaning up existing sources of pollution, including polluted runoff, is clearly the best and the most important remedy to the problem of beach water contamination. In the interim, however, consistent programs to adequately protect beachgoer health must be set in place.

Recent surveys of federal and state practices have shown that:

- current Environmental Protection Agency (EPA) recommended standards allow 19 out of every 1000 swimmers to contract illnesses such as gastroenteritis and even hepatitis;
- States use different standards of varying efficacy to judge the safety of coastal recreational waters;
- many states do little or no monitoring of their beach water despite evidence of local coastal pollution problems as well as heavy beach attendance; and
- government agencies often fail to provide the public with timely notification of potential health risks even when monitoring shows that standards have been exceeded.

The B.E.A.C.H. bill requires EPA to develop health-based water quality criteria to protect beachgoers and to issue regulations on procedures to monitor coastal recreation waters based on: (1) how frequently a beach is used, (2) proximity of pollution sources, and (3) short term increases of bacteria and viruses resulting from rainfall, malfunctions of wastewater treatment works, or other causes. The States then have 3 years to promulgate their own health-based standards or adopt EPA's minimum

criteria. States are also required to post signs on beaches notifying the public of potential health risks when water quality does not comply with State coastal recreation water standards. Additionally, the bill requires EPA to develop guidance on uniform assessment and monitoring of marine debris.

We believe that it is in the best interest of the country to have a comprehensive and effective national program to protect beachgoers from potential health risks of contact with polluted waters. In addition, the economic impacts of polluted beaches must be considered, as tourists spend billions of dollars annually visiting coastal counties and their ocean and bay beaches. The protection of beachgoers through cleanup of polluted waters and effective monitoring is well worth the investment.

By becoming a co-sponsor of this important legislation you would help to install nationally consistent standards, monitoring criteria, and closure notification requirements that would protect beachgoers everywhere while ensuring that no state is at a disadvantage for taking effective action. Thank you for your consideration of this legislation. Please feel free to contact us if we can be of any assistance.

Sincerely yours,

Robert Sulnick, Executive Director, American Oceans Campaign, Santa Monica, California; Gary Magnuson, Vice President for Program, Center for Marine Conservation, Washington, DC; Dawn M. Martin, Issues Director, American Oceans Campaign, Washington, DC; Ann Powers, Vice President and General Counsel, Chesapeake Bay Foundation, Annapolis, Maryland; Fred Felleman, Director of Northwest Office, American Oceans Campaign, Seattle, Washington; Mimi McConnell, Executive Director, Coalition for Buzzards Bay, Buzzards Bay, Massachusetts; Dale Shecker, Editor, California Diving News, Torrance, California; Mark Davis, Executive Director, Coalition to Restore Coastal Louisiana, Baton Rouge, Louisiana; Beth Millemann, Executive Director, Coast Alliance, Washington, DC; Lynn Nettles, Editor, Florida Scuba News, Jacksonville, Florida; Peter Shelley, Senior Attorney, Conservation Law Foundation, Boston, Massachusetts; Joe Payne, Casco BayKeeper, Friends of Casco Bay, South Portland, Maine; Cynthia Poten, Delaware Riverkeeper, Delaware River Network, Lambertville, New Jersey; Velma Smith, Director of Domestic Policy, Friends of the Earth, Washington, DC; Cheri Boone, Publisher, Dive Boat Calendar and Travel Guide, Huntington Beach, California; Linda Shead, Executive Director, Galveston Bay Foundation, Webster, Texas; Scott Jones, Vice President, Dive 'n' Surf, Redondo Beach, California; Adi Lieberman, Executive Director, Heal the Bay, Santa Monica, California; Kimberly Woods, President, D.I.V.E.R.S., Fountain Valley, California; Jeff Bertsch, President, Inner Frontier, Durham, North Carolina; Jim Prusa, Executive Director, Diving Equipment Manufacturers Association, Huntington Beach, California; Nancy Seligson, President, Long Island Sound Task Force, Stamford, Connecticut; Kathy Phillips, Executive Director, Eastern Surfing Association, Ocean City, Maryland; Terry Backer, Executive Director, Long Island Soundkeeper Fund, East Norwalk, Connecticut; David Dickson, Senior Analyst, Environmental Working Group, Washington, DC; Gloria Rains, Executive Director, Manasota 88, Palmetto, Florida; Sarah Chasis, Senior Attorney, Natural Resources Defense Council, New York, New York; Curt Spalding, Executive Director, Save the Bay, Providence, Rhode Island; Sam Jackson, Executive Director, National Association of Underwater, Instructors, Montclair, California; Beth Nicholson, Chairperson, Save the Harbor/Save the Bay, Boston, Massachusetts; Todd Miller, Executive Director, North Carolina Coastal Federation, Swansboro, North Carolina; Barry Nelson, Executive Director, Save San Francisco Bay Association, Oakland, California; Nina Bell, Executive Director, Northwest Environmental Advocates, Portland, Oregon; Matilda Pernell, Executive Director, Save Wetlands and Bays, Millsboro, Delaware; Dick Bonin, Executive Director, Ocean Futures, Huntington Beach, California; Derb Carter, Attorney, Southern Environmental Law Center, Chapel Hill, North Carolina; Kris McDivitt, Chief Executive Officer, Patagonia, Inc., Ventura, California; Sam Allen, Chief Executive Officer, Sport Chalet, Inc., LaCanada, California; Kathy Fletcher, Executive Director, People for Puget Sound, Seattle, Washington; Tom O'Neill, Trustee, Surfrider Foundation, National, San Clemente, California; Peter Lavigne, Director of Leadership Program, River Network, Portland, Oregon; Mark Harris, Chair, Humbolt Chapter, Surfrider Foundation, Humbolt, California; Vicki Nichols, Executive Director, Save Our Shores, Santa Cruz, California; Bill Soskins, Chair, Monterey Chapter, Surfrider Foundation, Monterey, California; Bill McLaughlin, Chair, San Francisco Chapter, Surfrider Foundation, San Francisco, California; Mark Halvorsen, Chair, Ventura Chapter, Surfrider Foundation, Ventura, California; Neil McQueen, Chair, Santa Cruz Chapter, Surfrider Foundation, Santa Cruz, California; Ken Newfield, Chair, Northshore Chapter, Surfrider Foundation, Haleiwa, Hawaii; Tex Haines, Chair, Laguna Beach Chapter, Surfrider

Foundation, Laguna Beach, California; Marilyn Spitz, Chair, Delaware Chapter, Surfrider Foundation, Rehoboth Beach, Delaware; Jeff Schfaegel, Chair, Long Beach Chapter, Surfrider Foundation, Long Beach, California; Debbie Sease, Legislative Director, Sierra Club, Washington, DC; Nancy Gardener, Chair, Newport Beach Chapter, Surfrider Foundation, Newport Beach, California; Greg Pollack, Chair, New Jersey Chapter, Surfrider Foundation, Tinton Falls, New Jersey; Scott Dittrich, Chair, Malibu Chapter, Surfrider Foundation, Malibu, California; Kevin Dubola, Chair, New York Chapter, Surfrider Foundation, St. James, New York; Betty Steel, Chair, San Diego Chapter, Surfrider Foundation, San Diego, California; Brant Wise, Chair, Outer Banks Chapter, Surfrider Foundation, Kill Devil Hills, North Carolina; Dave Marshall, Chair, Santa Monica Chapter, Surfrider Foundation, Santa Monica, California; Randy Harris, Chair, Virginia Beach Chapter, Surfrider Foundation, Virginia Beach, Virginia; Mike Allen, Chair, Santa Barbara Chapter, Surfrider Foundation, Santa Barbara, California; Alan Gregg, Chair, South Florida Chapter, Surfrider Foundation, Miami, Florida; Mike Mantell, Chair, Houston Organizing Committee, Surfrider Foundation, League City, Texas; Valerie McCane, Chair, Galveston Organizing Committee, Surfrider Foundation, Lake Jackson, Texas; Dave Pekozi, Chair, Rhode Island Organizing Committee, Surfrider Foundation, Newport, Rhode Island; Carolyn Hartman, Staff Attorney, U.S. Public Interest Group, Washington, DC; Don Larson, President, Washington Scuba Alliance, Olympia, Washington; Jennifer King, President, Women's Scuba Association, Blue Jay, California

AMERICAN OCEANS CAMPAIGN

Mr. Bill Leary
Committee on Environment and Public Works
SH-505 Hart Senate Office Building
Washington, D.C. 20510

22 November 1993

Dear Mr. Leary:

Pursuant to Senator Graham's letter of request mailed to me on October 12, 1993, the following information is intended to respond to questions for the August 4, 1993 hearing record as posed by Senator Lautenberg. I apologize for the delay in preparing these responses.

1. Can American families feel secure in knowing that when they vacation in one of our coastal states the beach water that their children swim in will not make them sick? Why?

No, American families cannot feel secure in knowing that when they vacation in one of our coastal states the beach water that their children swim in will not make them sick. The Environmental Protection Agency does not mandate minimum testing procedures or nationwide bacteria standards for recreational waters. Left to their own volition, states monitor with less than optimal frequency. Eight states do not monitor their coastal waters for swimmer safety. Five coastal states have limited testing programs. In addition, there are no federal requirements for public notification and beach closures when the bacteria level violates water quality standards. The lack of national requirements for public notification, bacteria standards, and testing procedures prevents parents from receiving information that could be used to protect their families while using our recreational waters. Until there are uniform standards, monitoring and closure practices, families will be unsure whether they are being adequately protected when swimming at beaches in different parts of the country.

2. What are the main reasons that beaches sometimes need to be closed, and what are the health consequences when people swim in beach waters that should be closed?

The overwhelming majority of beach closings and advisories are caused by high levels of bacteria in coastal waters. The major causes of high bacteria levels in beach water are: inadequate and overloaded sewage treatment plants, raw sewage discharges from combined or sanitary sewers, polluted stormwater runoff, faulty septic systems, and boating wastes.

When people swim in beach waters that should be closed, they risk contracting several diseases. The wide range of diseases that can be carried by bacteria in sewage-contaminated waters include gastroenteritis, dysentery, hepatitis, salmonellosis, shigellosis, and infection caused by *E. coli*. A swimmer afflicted with gastroenteritis will exhibit one or more of the following symptoms: vomiting, diarrhea, stomachache, nausea, headache, and fever. Amoeba and protozoa are also found in coastal waters and can cause giardiasis, amoebic dysentery, skin rashes, and "pink eye." These diseases are not life-threatening for most persons but are discomforting and occasionally lead to lost working days. The consequences of contracting swimming-associated illnesses can be greater for children, elderly people, and others with weaker immune systems.

3. Because EPA has not mandated that states adopt minimum standards for monitoring beach waters, there is great inconsistency in standards used among--and even within--states. Do you perceive this as a problem? Why?

Yes, the inconsistent standards used by coastal states to monitor beach waters is a significant problem. Swimmers and beachgoers cannot be truly assured the coastal water they use is safe until minimum standards are adopted nationwide. Frequently, beach water with comparable water quality transcends two jurisdictions. The jurisdictions that do not monitor and post water quality violations or have less stringent standards provide a beachgoer with a false sense of security.

4. What is the cost burden to states that would need to comply with S. 997? Can you discuss this in context of any benefits that those same states would derive?

Coastal states would derive substantial benefits if our nation took the initiative to clean up coastal waters. The primary benefit of cleaning up coastal waters would be improved health protection for beachgoers nationwide. Another benefit would be increased revenue from tourism and recreation. Currently, over one-hundred and sixty million individuals visit bay and ocean beaches each year, generating billions of dollars for the local tourist industries. According to the Florida Department of Natural Resources, coastal tourism was responsible for generating \$12 billion of income in 1992. Coastal tourism generated over \$9 billion in New Jersey in 1992. Jobs that are dependent on coastal recreation and tourism would be saved if coastal waters were cleaned up and tourists felt confident that they would be notified if waters were unsafe for recreational use. Tourists would be likely to return to beaches where local officials were straightforward concerning their health. Finally, recreational water sport users are more likely to invest in their activities and equipment and spend their time where they feel safe from pollution-borne diseases.

The costs associated with cleaning up the coastal waters saves money in the long run because we are preserving a valuable economic and environmental resource. The cost of the monitoring program is reasonable when one considers that states do not have to include every mile of beach and are not required to monitor every area to the same

degree. The Natural Resources Defense Council recently published a comprehensive study of monitoring costs of existing beach protection programs. NRDC discovered that, in 1992, the annual monitoring cost per beach mile ranged from \$541 to \$7500. New Jersey monitored 127 miles of beach at a cost of \$1,575 per mile. Orange, Los Angeles, and Santa Cruz Counties in California spent an average of \$2,683 per mile to monitor 164 miles of beach. Considering the local and state revenues generated from cleaner water, any investment in water pollution clean up is worthwhile.

5. What is your opinion of the exemption contained in the BEACH bill which allows some beaches not to be tested? What are some of the conditions where an EPA exemption from the monitoring standards would be appropriate?

We do not support the exemption contained in the BEACH bill which allows some "discrete areas of coastal recreational waters" not to be tested. Water pollution does not confine itself to specific boundaries; there is always a risk that pollution will infiltrate popular beach areas. As the monitoring program is designed, every mile of beach water does not have to be periodically tested. We should not encourage a potentially unfavorable and ambiguous loophole by exempting some "discrete" areas that should be monitored routinely.

Some beach areas are clearly not frequented by swimmers as often as others, however, EPA already has the discretion to develop monitoring standards that allows for flexibility in the monitoring regimes. Such an "exemption"--or less rigorous monitoring programs--should be left for EPA to determine as it develops coastal water monitoring standards. This approach is more preferable than including a potentially ambiguous loophole in statutory language.

Thank you for the opportunity to respond to Senator Lautenberg's questions.

Sincerely,

Dawn M. Martin
Director, Washington D.C. Office

STATEMENT BY RICHARD E. WEDEPOHL, NORTH AMERICAN LAKE
MANAGEMENT SOCIETY, MADISON, WISCONSIN

My name is Richard E. Wedepohl and I am a past president of the North American Lake Management Society (NALMS). I presently serve as Chair of NALMS Government Affairs Committee and am the State of Wisconsin's Lake Management Coordinator. Recently I have also served as Chair of Water Quality 2000's Urban and Rural Runoff Challenge Team which focused on defining solutions to our nation's water quality problems which originate from rural and urban runoff. NALMS, the organization I am representing today, is an international organization of citizens, scientists, lake associations and water pollution control professionals who are deeply concerned about the water quality in our nations lakes, ponds and reservoirs. Although relatively young, NALMS has members in every state, Canada and several other countries throughout the world, along with chapters in almost half of our nation's states. The Society's strong and diverse membership is in itself testimony to the abiding and lasting concern about the present and future condition of our nation's lakes. I am here today on behalf of our Society to offer to this Subcommittee testimony relative to S. 1198, the "Lakes Assessment and Protection Act of 1993" recently introduced by the Honorable Senator George Mitchell, and S. 1114, the Water Pollution Prevention and Control Act of 1993.

Let me begin by stating, as strongly as possible, our support for S. 1198, Senator Mitchell's Lake Assessment and Protection Act. This is, without a doubt, the finest piece of legislation our organization has had opportunity to comment on. Our compliments to Senator Mitchell and the staff who have worked hard over the past three years to put this piece of legislation together. S. 1198 has many fine provisions which build upon the 17 years of experiences and lessons learned from the highly successful Section 314 Clean Lakes Program, most of which focused on watershed protection and control of nonpoint sources of pollution. Although our nation's lakes would benefit if S. 1198 were adopted independently, it would be our preference to see it enrolled, in its entirety, into the Clean Water Act Amendments. By so doing, it is our belief that the many strengths of this piece of legislation would spill over into other, much newer, nonpoint source and watershed initiatives, strengthening the act in total.

WHY SPECIAL EMPHASIS ON MANAGING AND RESTORING LAKES AND RESERVOIRS?

Your committee has heard many times the facts and figures on the quality of our nation's water resources and how critical it is for us to get on with addressing nonpoint source pollution. Additionally you have heard a great deal about the importance of managing water resources by using a watershed approach and you have heard about the importance of involving individuals and local communities if we are to meet our water quality objects. We add our support to these. What has not been stated, very well, is the critical need to focus our nonpoint source and watershed based control efforts to help solve the lake degradation which continues to occur.

Lakes are without a doubt a major water resource of our nation. Freshwater inland lakes and reservoirs provide our nation with 70% of its drinking water. They supply water for industry, irrigation, and hydropower. Their ecosystems provide the habitat needed to support large numbers of endangered and threatened species. Lakes are the cornerstone of our nation's \$19 billion dollar freshwater fishing industry. Freshwater inland lakes and reservoirs form the backbone of numerous state's tourism industries. They provide countless numbers of recreational opportunities whether it be for swimming, fishing, boating, or purely aesthetic enjoyment. In Minnesota alone, riparian areas around lakes are valued at \$10 billion with lakes supporting the bulk of the state's \$5 billion tourism industry.

Lakes are a way of life in this country, but sadly their quality has long been neglected. Over 50% of all classified lakes and reservoirs are of poor or very poor quality. Many more are threatened and since 1986 there has been a 40% decline in the percentage of assessed lakes and reservoirs which are meeting their designated uses. Although great strides have been made in cleaning up our streams and rivers, which have been dominated by point sources of pollution, relatively little progress has been made in improving the quality of our nonpoint source dominated lakes.

THE STRENGTHS OF S. 1198

The success of the Section 314 Clean Lakes Program has never been questioned. The program model was based on sound science, was driven by needs identified at the grass roots level, and has been implemented with the principle of the need to build strong state/local partnerships to solve watershed level problems. Recently

the National Research Council's Committee on Restoration of Aquatic Ecosystems described the Clean Lakes Program as "a model of federal restoration efforts, especially with regard to its emphasis on causes of lake problems and on local and state participation". A 1993 EPA review of the program highlighted its many successes. Former head of the EPA's Office of Water, Lajuana Wilcher, in 1991 described the Clean Lakes Program as "the quintessential example of empowering citizens to work closely with their local, State and Federal governments in achieving common goals". Finally, this was all accomplished with a program that has had little to no budget support from EPA, operating with an average annual appropriation of less than \$10 million per year. Senator Mitchell's Lake Assessment and Protection Act of 1993 revises and strengthens elements of the Section 314 Clean Lakes Program. Additionally it builds upon the experiences of that program by correcting weaknesses learned over the 17 years of the program's existence. Specifically:

- Section 3 of the bill provides a well conceived approach to get practical research done at all levels. It recognizes the special sensitivity of lakes and the need to develop interdisciplinary solutions.
- Section 4 directs EPA to develop lake specific water quality criteria, an issue our organization has been very actively pursuing for the past 6 years. Without criteria, and the establishment of standards, setting pollution controls is problematic, if not impossible. While the Act's four year timeline is very aggressive, it is achievable, at least for the more proactive states. Quite rightly it also offers sufficient latitude and flexibility to the states to allow for regional differences.
- Section 5 is the core of S. 1198. It provides program support to the states, supports local initiatives to assess pollution sources and develop corrective responses, and provides support for implementation of the control plan. This section recognizes that even if all sources of pollution are stopped, lake water quality response will be slow. Once degraded, lakes recover very slowly, retaining 90% or more of the pollutants added to them. This act recognizes that although future nonpoint source initiatives may protect lakes and reservoirs, they cannot restore them and may not improve them. Additionally this section will lead to many more states utilizing the Section 314 model to develop their own programs. This section helps take the new lakes initiatives of many states beyond the strictly case by case scenario, allowing them to develop more comprehensive protection initiatives which will affect large numbers of lakes within each state. This is a major strength of the act.
- State revolving loan fund eligibility is a logical addition.
- A national ban on phosphorus in detergents is an issue which should have been addressed long ago. So many individual states have already adopted their own phosphate detergent bans that many manufacturers no longer use phosphorus as a detergent builder because of distribution problems. Consequences of the ban in those states where it has already been adopted have been virtually non-existent. This is pollution prevention at its best. There is absolutely no reason not to extend the ban to the national level.
- Section 9 directs agricultural programs to provide priority consideration to watersheds of impaired lakes. Given the financial magnitude of agricultural incentive programs their use can provide tremendous benefits if targeted to sensitive lakes. It is very important that EPA and USDA coordinate their efforts. The water quality benefits to lakes provided by this section may very well exceed any of the others. We do, however, recommend that language be added to make threatened lakes be eligible as well as those already impaired. Prevention is far more cost-effective than is correction.
- Education, Section 10. This section is absolutely essential if we are to make long term progress. It thoughtfully allows those states which wish to take the lead to do so, while providing a backup for those citizens who want to participate but do not have an active state program. Citizens have demonstrated again and again their willingness to volunteer to help solve lake problems. Their value cannot be discounted. We would strongly recommend that funding, in the order of \$5 to \$6 million, be provided to support this initiative. Without a strong state-level coordination effort along with resources for monitoring equipment, training, etc., the vast potential of these volunteer programs will be under-utilized. The citizens who participate in these programs will be the same ones who'll be there help make the watershed and nonpoint source elements of S. 1114 work at the local level.
- Section 11 recognizes the need to control specific exotic species. The approach provided is a logical one.

Overall, S. 1198 is an extremely well conceived and developed bill. It has few flaws and is a logical extension of the section 314 program. However, given the low

funding levels provided by this bill, it is essential that lake water quality problems are also given special attention in the new watershed and nonpoint source initiatives of S. 1114 and other related bills. Indeed, if the special needs of lakes are not recognized and incorporated into this act, the success of the new watershed and nonpoint initiatives will be very much threatened.

THE WATER POLLUTION PREVENTION AND CONTROL ACT OF 1993

Generally NALMS is supportive of S. 1114. The act recognizes the importance of assessing problems and developing solutions using the watershed approach, it provides more emphasis on controlling nonpoint sources of pollution and it begins to recognize the key role volunteers, individual citizens and local communities must play if nonpoint sources of pollution are to be dealt with. While we have the general sense that this bill is still more top-down than bottom-up in design, and that little emphasis was placed on the need to develop state and local infrastructure, some of this weakness would be corrected if the citizen initiated clean lakes projects proposed with S. 1198 could be effectively incorporated and integrated into the watershed and nonpoint sections of S. 1114. As stated earlier, the state/local partnership structure and model for effective, voluntary, local watershed management has already evolved through the clean lakes program and incorporation of these principles into these newer initiatives would greatly increase the chances for S. 1114 to be ultimately effective.

A key language weakness of this bill, which we trust was not of general intent, is the emphasis on the clean-up of impaired watersheds. Although there are sections related to protection and prevention actions, they are buried and often left to the discretion of the administrator or the states. Protection of our many still high quality resources is the most cost-effective actions we could take. For example, throughout the act, "threatened waters" should be added wherever "impaired waters" are mentioned and "protection and maintenance" emphasis added as appropriate elsewhere.

Along this same prevention vein, NALMS is very concerned that there still exists little incentive for state or local programs to address control of post-development stormwater runoff under section 402(p). Presently EPA and state implementation of the stormwater permitting program does not effectively deal with control of post-development runoff from new developments. As the program is now being implemented any new construction activities greater than 5 acres in size must control runoff during construction. Post-development controls are not required. EPA in its guidance, only requires that if post-development controls are to be used they must be described. There are absolutely no requirements that control of post-development runoff be seriously addressed. To correct this major deficiency we propose that a new section be added to this act which would focus specifically on controlling runoff from new developments. The section should require that the appropriate regulatory authority institute any zoning or other regulatory provisions necessary to prevent post development runoff problems. Permittees should be required to show that all new development will incorporate post-development runoff control practices. State level requirements should be flexible and variances should be allowed to accommodate regional needs. The issue here is that states and local regulatory authorities need to become serious about addressing this problem. The time has past when we can willy-nilly pave all the land around our sensitive lake resources, assuming their pollutant assimilative capacity is endless.

We sincerely appreciate the courtesy and consideration extended to us. Thank you.

TESTIMONY OF GEORGE A. BRINSKO, PRESIDENT, WESTERN COALITION OF ARID STATES, TUCSON, ARIZONA

INTRODUCTION

Good Morning Mr. Chairman, and members of the Subcommittee. My name is George Brinsko. I am President of the Western Coalition of Arid States, otherwise known as WESTCAS. I am also the Director of the Wastewater Management Department in Pima County, Arizona.

WESTCAS has requested the opportunity to testify before your Subcommittee in order to inject an arid West perspective into these discussions on the Clean Water Act Reauthorization. Our concerns about this Reauthorization are that the issues of the arid West are missing, on both a conceptual and implementation level. Our testimony will focus on (1) a description of continuing arid West problems with the Clean Water Act, (2) the concepts needed to include arid West concerns in the Reau-

thorization, (3) our proposals for change in the language of the Act and (4) the need for research projects and programs for arid West ecosystems to be instituted under the Reauthorization.

WESTCAS

Before I begin on these themes, however, I believe it would be helpful to the Subcommittee if I gave you a little background on WESTCAS. The Western Coalition of Arid States was formed in 1992 by a group of Western water and wastewater agencies concerned about the manner in which water quality and water resource management issues were being addressed in states throughout the arid West—defined as areas with less than 15 inches of annual rainfall.

In the last eighteen months, WESTCAS has attracted more than 50 members from five Western states: Arizona, California, Colorado, New Mexico and Nevada. Representatives from agencies in several other Western states have consistently participated in our quarterly meetings and we have every reason to believe that they too will be joining us in the near term.

WESTCAS's main objective is to assist in the development of water quality regulations, policies and laws which promote the protection of arid and semi-arid ecosystems throughout the West. With that in mind, WESTCAS has developed proposals for specific changes in the Clean Water Act Reauthorization that would protect those species which actually exist in arid ecosystems. For example, we are committed to a policy that the quality of our effluent should protect "what is there;" but we oppose policies that require us to adopt extremely expensive measures to protect aquatic species which may not even exist in arid and semi-arid ecosystems.

IMPLEMENTATION OF THE CLEAN WATER ACT IN THE ARID WEST

Prior to my move to Arizona, I served 22 years as General Superintendent of Operations for the Allegheny County Sanitary Authority in Pittsburgh, Pennsylvania, and also as President of the Pennsylvania Water Pollution Control Association. In Pennsylvania, "a river is a river," in every sense of the word. By that I mean that it actually has water flowing in it twelve months a year. Under those circumstances, the quality of the receiving water becomes extremely important in determining the level of treatment to apply to effluent to meet the Environmental Protection Agency's (EPA) National Pollutant Discharge Elimination System (NPDES) permit requirements.

But, 14 years ago, I was introduced to a completely new set of circumstances and challenges when I moved to Pima County in southern Arizona. Pima County is located in the heart of the Sonoran desert, an "arid ecosystem." The environment in southern Arizona is typical of the arid and semi-arid ecosystems found throughout 17 of our Western states.

I moved to Pima County to establish the first regional wastewater treatment system in Arizona. One of my first and most vivid experiences, upon my arrival, was standing beside the Santa Cruz River—a river with no water. The river had begun as a dry wash, commonly known in the west by its Spanish name, arroyo. Exhibit 1 depicts an example of what I saw on that memorable day.

Now to someone who has been raised in the eastern United States, a river without water would seem to be a bit of a contradiction. But that is not the case in my new homeland. The arid West is laced with arroyos and dry rivers such as the Santa Cruz; they are actually ephemeral streams. Ephemeral streams have streambeds that are, at all times, above the water table. These streambeds are created over time by periodic powerful rainstorms whose runoff cuts through the desert floor. Ephemeral streams only flow in direct response to one of these storms. Exhibit 2 depicts the Santa Cruz River experiencing one of these rainstorms, or monsoons, as they are commonly known in the Southwest. These storms are beautiful to observe and experience, but they can also be dangerous and deadly. They often cause loss of life and millions of dollars of property damage.

The point is that "rivers" such as the Santa Cruz are dry 80 percent of the year. However, ephemeral streams like the Santa Cruz have sections—or reaches—that owe their flows primarily to effluent from local wastewater treatment facilities. Such reaches, which are actually independent ecosystems, are more specifically designated "effluentdependent".

THE 1972 CLEAN WATER ACT

I want to emphasize from the outset that WESTCAS supports the objectives established by the Clean Water Act. The Act has provided all of us with a major tool to restore and maintain the physical and biological integrity of the nation's navigable waters.

Our concerns arise from the application of the Clean Water Act to the arid West environment. Concepts and regulations that make perfect sense when developed in terms of "wet" ecosystems have major flaws when applied to arid West water and wastewater situations. Water quality standards are a good example of this. State water quality standards and EPA permit limits are being established on the basis of nationally-based scientific water quality criteria developed in and for "wet ecosystems." Unfortunately, those who established these national criteria failed to take into consideration differences in environmental ecosystems such as those found in arid and semi-arid ecosystems.

Under current federal policies, states and agencies must use these national criteria as a basis to develop state water quality standards. Otherwise, states must develop their own site-specific data to justify using different water quality standards. In other words, arid states that believe national criteria are inappropriate for all of their ecosystems must choose between two options: (1) use these inappropriate national water quality criteria, or, (2) invest extensive local financial and scientific resources to develop site-specific standards for each stream in these ecosystems. This is an extremely burdensome and expensive task. To accomplish this, the state must identify designated uses for each stream reach, then develop water quality criteria documents to calculate the water quality standards necessary to protect the designated uses.

Another unique feature of the 'arid West is the extensive use of constructed water conveyance systems. During the reclamation of the arid West over the last 90 years, canals were constructed to transport groundwater or surface water to agricultural lands or municipal water treatment plants. Incidental ecosystems have evolved in some of these canal systems. Future regulations for canals must recognize the original intended water use, and not impede critical water management programs to meet a national fishable/swimmable policy. Canals were designed to move water for human use, not maintain an artificially constructed fishery. The Reauthorization should also permit the development of water quality standards to allow the use of ephemeral streams for the transportation of reclaimed water.

AMENDMENTS TO THE CLEAN WATER ACT: WESTERN ISSUES UNADRESSED

WESTCAS members, and other water and wastewater agencies throughout the West, must perform a balancing act between competing forces. On the one hand, we must fulfill our mandated responsibility to protect the environment by meeting NPDES permit requirements; on the other hand, we must convince our local elected officials and ratepayers that we are spending increasingly limited resources wisely and efficiently. But it is difficult for us to justify expending millions of dollars to build new wastewater treatment facilities, or to retrofit existing ones, to comply with increasingly stringent standards for effluent discharges when such additional improvements will result in no measurable net environmental benefit. The costs could actually reach into the billions, if the same inappropriate water quality standards are required for stormwater discharges. The West needs the local and regional flexibility to adapt water quality programs to local ecosystems and conditions, particularly in the absence of federal dollars for these national mandates.

Now I want to make it clear that we are not arguing that these ephemeral stream environments do not need protection from pollutants. Because, they do. In fact, when effluent is discharged to certain reaches of these ephemeral streams, a lush riparian ecosystem is often created. If the discharges are continuous, a unique biological community may evolve. The photographs in Exhibit 3 illustrate this on a reach of the Santa Cruz River below Pima County's Ina Road Water Pollution Control Facility. This reach is a year-round, effluent-dependent ephemeral stream which has created a unique environment for birds, reptiles, and small animals. And we believe that we have a major responsibility to protect such ecosystems.

WESTCAS members have consistently supported the goals of the Clean Water Act. We believe that S. 1114 will significantly enhance our national efforts on water pollution. However, the Reauthorization needs to address the issues essential to the management of the water and wastewater resources of the arid West. We respectfully request the Committee to add an "Arid West" finding to S. 1114. The finding would state that Congress recognizes the diversity of watersheds and waterbodies throughout the nation and that environmental protection of arid West ephemeral and effluent-dependent ecosystems would be enhanced by the development of regional water quality criteria documents. This finding would specifically indicate the intent of Congress regarding water quality regulations for arid West ecosystems.

We further urge the committee to add "Arid West" amendments to the bill to address these special needs. First, in regard to water quality criteria and standards, these amendments should:

- Authorize and fund research to develop appropriate water quality criteria for arid ecosystems;
- Require the development of appropriate water quality standards for canals and other man-made waterways which protect the intended uses of these water conveyance and irrigation systems;
- Modify the anti-backsliding concept to allow development and adoption of appropriate water quality criteria and water quality standards suitable for the arid West.

Second, these amendments should also address:

- The primacy of the states in designating appropriate uses and protection of their waters;
- The utilization of reclaimed water as a valuable water supply resource in the arid West;
- The ability of reclaimed water to create and maintain riparian habitats;
- The interaction between the environmental, social and economic effects of policies, regulations and permits designed to protect arid ecosystems;
- The use of "biomonitoring" (whole effluent toxicity testing) as a warning signal rather than as an enforcement tool.

WESTCAS has prepared specific language on these issues for the Committee's consideration in the Reauthorization process. This language will lead to practical, workable regulatory guidelines which will enable Western agencies to manage scarce water resources in an environmentally sound manner with strong consideration for local concerns and values.

WESTCAS agrees with the testimony recently presented to the House of Representatives' Committee on Transportation and Public Works, Subcommittee on Water Resources and Environment, by the National Governor's Association and the Association of Metropolitan Sewerage Agencies on the critical need for significantly increased funding for Clean Water activities. We agree with the testimony of the National Association of Counties on the need to reinstate a Clean Water grants program for special needs and special communities. WESTCAS also supports the voluntary program approach for watershed management, but we have some concerns about the implementation of the watershed management concept.

WATERSHED MANAGEMENT

Many distinguished organizations and individuals have been advocating a watershed management approach to resolve water quality issues. The voluntary watershed management program concept in S. 1114 reflects the recent increase of interest in this approach. WESTCAS supports the concept of water quality planning and program implementation using a watershed management approach. WESTCAS members can bring many years of experience in water quality planning, financing improvements and operating facilities to this approach. These experiences prompt us to approach the implementation of this concept with prudent caution.

We do not believe that any single methodology or perspective is a panacea to solve our water quality problems. An elaborate structure of federal, state and local regulations and governing entities has evolved to meet the requirements of the current Clean Water Act. The integration of the watershed management approach into these existing structures must be designed, managed and implemented with great care. The voluntary programs encouraged by this legislation should be carefully monitored to allow this approach the greatest opportunity to grow and succeed. WESTCAS has developed a position statement of principles for a watershed management approach to water quality. These principles include watershed management decisions based on good science and watershed program funding from multiple sources. These positions are included in our written submission to the Committee.

WESTCAS has also prepared specific comments on other provisions of S. 1114. However, in recognition of the committee's time constraints, I will not review all these statements at this time. The comments on S. 1114, the watershed management position statement and proposed Reauthorization language on arid West issues are attached to our written submission as Exhibits 4, 5 and 6, respectively.

ARID WEST DEMONSTRATION AND RESEARCH PROJECTS

WESTCAS members are developing several projects and programs within their own states to research, demonstrate and facilitate better management of water and wastewater resources throughout the arid West. These include wetlands, reclaimed

water, desalinization projects (Eastern Municipal Water District—California); use attainability analysis (Santa Ana River Dischargers Association under the management of the Santa Ana Watershed Project Authority—California); reclaimed water/recharge projects (Phoenix, Mesa, Tempe and Scottsdale—Arizona); wetlands (Pine-top-Lakeside—Arizona) and the regional Water Quality Research Project (Pima County Wastewater—Tucson, Arizona). WESTCAS is also initiating a regional survey of arsenic levels in small water systems and coordinating the development of a statistical methodology to account for the natural biological variability of chronic effluent toxicity testing for western wastewater agencies. WESTCAS offers these efforts to the Subcommittee as examples of the kinds of programs the Congress should be encouraging in arid ecosystems. The future water supplies of the West are being developed through these projects.

Without good science, we run the risk of expending scarce financial and technical resources on unnecessary and non-critical pollution control activities. Without full-scale research and demonstration projects, we lack the ability to develop the appropriate water quality criteria and standards to effectively control water pollution, increase effluent utilization and encourage new technologies and environmentally sound methods to manage and preserve our limited water resources.

WESTCAS believes that there is only one way we can be certain we are protecting arid ecosystems in accordance with good science and the dictates of the Clean Water Act. And that is for us to conduct the basic scientific research and demonstration needed to identify "what is there" and then to determine how to protect it.

There is a very real danger that current federal policies are simply shifting the cost of much needed research and demonstration projects to local jurisdictions. It may be felt that this is a savings in federal expenditures. In reality, it results in excessive expenditures of resources at state and local levels that have limited transferable technology potential. Congress can achieve tremendous economies of scale by adopting a regional approach to the science of arid lands water quality management. Research and demonstration projects on western water resource management could be funded and implemented for regional benefit. Both the federal government and many diverse arid West interests would benefit from a federal partnership on these projects.

Let's talk about the role of research. The preamble to S. 1114 notes that municipalities and districts will be spending \$80 billion dollars in new capital costs to improve the nation's water quality. When we construct a new treatment plant or modify a process, 10 percent to 15 percent of the total construction budget is expended up front for planning and design. The implementation of the nation's water quality program demands an equivalent amount of research. Do we plan to spend \$8 to 12 billion dollars for research while we plan to construct \$80 billion dollars in water quality facility improvements? H.R. 1994, The Environmental Research, Development and Demonstration Authorization Act of 1993, would budget \$49 million for water quality research for the entire nation, about 2 percent of the total proposed construction funding for this fiscal year. We need to be as prudent and far-sighted in managing our nation's water quality program as individual agencies must be in managing the construction of treatment facility improvements and modifications.

Therefore, WESTCAS urges the committee to add a "Research Title" to S. 1114, including authorization language and suitable appropriations, to encourage the development and implementation of research and demonstration projects in the arid West regions to assure a plentiful supply of high-quality water for the region's future.

As a part of this research title, WESTCAS requests that the Subcommittee incorporate into the Clean Water Act the authorization for the Water Quality Research Project (WQRP), in Pima County, Arizona. This would create a program to conduct the research needed to develop appropriate water quality criteria documents for arid ecosystems throughout the arid West. WESTCAS supports the establishment of the regional WQRP, at the earliest possible opportunity, to conduct and coordinate this research for agencies throughout the arid West. The 1972 Clean Water Act actually dictates that this research activity should be encouraged and funded at the federal level. Under the Act, "the Administrator . . . shall develop and publish . . . criteria for water quality accurately reflecting the latest scientific knowledge . . ." Therefore, even though we believe this research program is already authorized in the Act, we would like the Committee to give their direct authorization of this program.

The research title should authorize \$5 million in FY 94 to begin the planning and design phase of the Project including construction of a biological laboratory. Pima County has offered to furnish the land, use of an analytical laboratory and profes-

sional staff support for the project. Copies of the proposal to establish the Regional Water Quality Research Project (WQRP) are attached to this testimony as Exhibits 7 and 8.

We also have documentation of other significant water quality and water resource management projects being pursued by WESTCAS agencies. These efforts can be discussed with your staff in more detail at their convenience, as some of these projects may also be appropriate for incorporation into a Clean Water Research title.

CONCLUSION

In closing, Mr. Chairman and Members of this Subcommittee, on behalf of WESTCAS, I would like to thank you once again for allowing me to appear before you. WESTCAS is anxious to work with you to bring this arid West perspective to the Clean Water Act Reauthorization. We appreciate the time and interest of the Committee in these issues.

STATEMENT OF HON. PAUL S. SARBANES, U.S. SENATOR FROM THE STATE OF MARYLAND

Mr. Chairman and Members of the Subcommittee. Thank you for this opportunity to testify on the Clean Water Act reauthorization and specifically on the Chesapeake Bay Restoration Program. I want to commend you for your efforts in developing comprehensive legislation to reauthorize and strengthen the Clean Water Act. The Clean Water Act has been fundamental to the national effort to clean up our Nation's waterways and fundamental to the cooperative effort to improve the water quality and restore the living resources of the Chesapeake Bay. Reauthorization of this Act—with continued funding for state sewage treatment revolving funds and new initiatives to address non-point source pollution, among other issues—is absolutely essential.

Today, I wish to report on the current state of the Chesapeake Bay and to urge the Committee to enhance the Chesapeake Bay Program by including S. 567, the Chesapeake Bay Restoration Act, which I and the other Members from the Bay area states introduced earlier this year, in the new Clean Water Act.

The Chesapeake Bay Program which was authorized by this Committee in the 1987 Water Quality Act, has been a successful endeavor. The cooperative Federal-State and interstate management structure established through the Chesapeake Bay Program has provided the framework for the restoration of the Bay and serves as a model for other estuaries throughout the country and around the world. The Bay Program has pioneered pollution prevention techniques such as phosphate controls, bans on toxic boat paint, nutrient management efforts, and programs to cut pesticide use on cropland. The Program serves as a proving ground for innovative approaches to environmental restoration.

With the signing of the Chesapeake Bay Agreement in 1987 and the 1992 amendments to the Agreement, the Federal government and the Bay area jurisdictions—Pennsylvania, Maryland, Virginia, the District of Columbia and their local governments—set goals, made plans and have undertaken commitments to an ambitious program to achieve improved water quality and living resources productivity.

The level of public support and the degree of cooperation and coordination among all parties—the Federal, State and local governments; environmental, community and citizens groups—is unparalleled. There are over 700 groups and some 40 committees involved in the Bay Program. Nine Federal agencies have signed Memoranda of Understanding (MOUs) with EPA to participate in the Program.

In the years since the Bay Program was authorized, substantial progress has been made both in putting in place a coordinated Federal-State-local-citizen management structure and in specific programs to address key problems in the Bay such as nutrient loads and the decline of living resources. Throughout this process, the Federal role has been crucial. It has served, in effect, as the glue that binds the program together and the catalyst that keeps it moving forward.

There are signs that the Bay is improving:

- Phosphorus discharges from municipal treatment plants, industry and nonpoint sources into the Bay have been reduced by 35 percent from 1985 levels. This is a direct result of the phosphate detergent ban now in place in each State and the District of Columbia, new sewage treatment plant construction featuring processes for advanced phosphorus removal, and the Bay Program's unique non-point source controls.

- Submerged Aquatic Vegetation (SAV), which provides critical habitat for the Bay's living resources, has made a slow but steady comeback from dramatic declines in the 1960s and 1970s. This can be directly traced to improved water quality.
- Striped bass have also made a significant recovery from the depleted stocks of the early 1980s. This success demonstrates that management controls can make a difference in the health of the Bay's resources.

But, despite these efforts, the job of restoring the Chesapeake to levels of quality and productivity that existed earlier in this century is far from complete.

Many of the Bay's living resources—oysters, shad, white perch—which are indicators of the Bay's health, are still in decline.

Runoff from farms and city streets and pollution from fertilizers, animal wastes, and air deposition, among other so-called non-point sources, continue to deprive the Bay of life-sustaining oxygen. Nitrogen loads to the Bay have increased by about 5 percent since 1985, despite the Chesapeake Bay's nutrient management program.

Population growth and development, and resulting pollution impacts in the watershed, threaten to undermine the gains that have been made thus far. The population of the U.S. increased by 22% in the past twenty years. In the Chesapeake Bay region, the population grew by roughly 40% over this same period. The cumulative effect of the growth in population is putting enormous pressures on our natural resource base.

Toxic chemicals are still present in the Bay's surface and bottom waters, having untold impacts on the Bay's water quality and wildlife.

A 1991 report prepared by the Chesapeake Bay Foundation entitled "Turning the Tide" documents many of these trends. It is clear that we need to do much more to really "turn the tide" and restore the Bay to health.

1993 marks the tenth anniversary of the signing of the first Chesapeake Bay Agreement and the beginning of a new phase in the Chesapeake Bay restoration effort. We have moved from the planning and analytical phase to advanced implementation of programs. Many of the relatively easy steps have been taken. Now we must begin addressing the problems that are much more difficult to resolve, as well as more expensive. New approaches and enhanced resources and effort are essential if we are to meet our goals and objectives in the Bay.

In order to address these problems I convened a distinguished group of experts on the Chesapeake Bay, consisting of representatives of the Bay area States, the District of Columbia, the Chesapeake Bay Commission, the Citizens Advisory Committee, the Scientific and Technical Advisory Committee, the Local Government Advisory Committee, the Alliance for the Chesapeake Bay, the Chesapeake Bay Foundation, and other agencies and organizations responsible for implementing the strategies and programs called for under the Bay Agreement. I asked them to identify the highest priority needs for the restoration of the Chesapeake in the years ahead. We have continued to refine these needs and the results of this effort are embodied in this measure.

What does the legislation do?

- First, it improves upon the management of the Bay program by facilitating cooperation and coordination among the various agencies and programs of the Federal government in support of the restoration of Chesapeake Bay. There are over sixteen Federal agencies or departments with responsibility for the stewardship of the Bay's resources or which have programs that influence or impact both directly and indirectly upon the Bay. These agencies include the U.S. Army Corps of Engineers, the U.S. Fish and Wildlife Service, the National Park Service, the National Oceanic and Atmospheric Administration, the Department of Defense, the U.S. Forest Service, the Soil Conservation Service and the Federal Highway Administration. By more effectively sharing information, pooling agency expertise and combining and targeting resources, we can improve the Federal response, get "more bang for the buck," and greatly enhance our abilities to protect and restore the Chesapeake Bay.

The legislation identifies and codifies the responsibilities of all the Federal agencies involved in the Bay cleanup effort and requires that they cooperate in developing and implementing plans, programs and projects to meet their commitments to the Bay program. Furthermore, it requires those agencies to report in their annual budget submissions on the activities that are being undertaken and planned. This will help ensure accountability of the agencies and that any problems encountered come to the attention of the Congress.

- Second, it requires the Federal facilities within the Chesapeake Bay watershed to review their operations on a regular basis and take corrective actions to ensure that these facilities do not adversely impact on the Bay's water quality

and living resources. A number of Federal agencies own or occupy large tracts of real estate in the Chesapeake Bay watershed. There are 66 military installations on approximately 350,000 acres. The U.S. Fish and Wildlife Service has 13 National Wildlife Refuges and a number of other facilities occupying approximately 46,000 acres. The Army Corps of Engineers owns approximately 70,000 acres in the watershed. While these agencies have made great strides in recent years to reduce discharges into the Bay, there are still problems to be resolved to further reduce point and nonpoint source discharge from Federally owned or occupied real estate and protect the natural resources of these areas.

The legislation would require each department, agency or instrumentality of the United States which owns or operates facilities within the Bay watershed to perform an annual assessment of their facilities to ensure consistency and compliance with the commitments, goals and objectives of the Bay program. It would also require the agencies to develop a detailed plan, funding mechanism and schedule for addressing or mitigating any potential impacts.

- Third, it authorizes a comprehensive research, monitoring and data collection program to assess the status and trends in the environmental quality and living resources of the major tributaries, rivers and streams within the Chesapeake Bay watershed and to assist in the development of management plans for such waters. Until now, the principal focus of the Bay cleanup effort has been on the mainstem of the Chesapeake. It has become increasingly clear however that many of the Bay's problems originate in the rivers and streams which flow into the Bay and that expanded efforts are needed in these waters if we are to achieve improvements in conditions in the Bay watershed. In the 1992 amendments to the Chesapeake Bay Agreement, the Chesapeake Executive Council committed to develop and begin implementation of tributary-specific strategies to "achieve the water quality requirements necessary to restore living resources in both the mainstem and the tributaries."

Although we have an extensive body of information about the mainstem Bay and its dynamics from current monitoring and modeling programs, there is a critical need for enhanced basic and applied scientific research and long term monitoring of the trends in environmental quality and living resources of the tributaries. For example we do not have a system for accounting for sources of nutrients, and the movements of nutrients, pollutants and sediments through the watershed.

It is clear that one of the most cost-effective ways to protect the rivers and streams in the watershed is to help, encourage and promote stewardship among the citizens and other interested parties who have a direct stake in the specific local situation. Stewardship starts with the individual citizens who live in the watershed. By conserving and protecting local water resources, citizens can also help to clean up the Bay. However they frequently need guidance in identifying the threats to the water body and in devising appropriate solutions.

The legislation specifically encourages local and private sector participation in efforts to protect and restore the rivers and streams in the Bay watershed by establishing a technical assistance and small grants program to support such activities as developing citizen monitoring programs, initiating local pollution prevention techniques and practices, and determining the most effective and appropriate vegetative plantings to prevent non-point source runoff into the rivers and streams. The "seed grants" would be available on a competitive and cost-sharing basis. The legislation also requires that the local efforts be coordinated in a watershed-wide strategy.

- Fourth, the legislation provides support to State and local governments in collecting and analyzing information about land use around the Bay to give planners better tools in making sound land use management decisions. The Year 2020 report underscored the need for comprehensive and coordinated information about forest resources, important habitat areas, unique and scenic areas and other sensitive areas so that planners can take this information into consideration in their planning and development activities. While land management and use is not a Federal responsibility, the Federal government through agencies like the Soil Conservation Service, U.S. Forest Service, U.S. Geological Service and NOAA, to name a few, have invaluable information and technical expertise which can be of great assistance to state and local authorities, when properly integrated. The legislation authorizes EPA to work with other Federal agencies in developing a coordinated watershed land use data base.
- Fifth, it establishes a habitat restoration and enhancement demonstration program to develop, demonstrate and showcase various low-cost techniques for restoring or enhancing wetlands, forest riparian zones and other types of habitat associated with the Chesapeake Bay and its tributaries. The wetlands, sub-

merged aquatic vegetation (SAV) beds, and forest buffer strips play a vital role in the Bay by absorbing nutrients such as phosphorus and nitrogen, trapping sediments, producing oxygen, and providing food, shelter and nursery areas for fish and wildlife. They also serve as measures, or "indicators" of the Bay's health. Scientists have demonstrated a clear link between water quality conditions and the survival and health of these various types of habitat. Protecting and restoring these resources offers tremendous opportunities to improve water quality conditions necessary to support the living resources of the Bay and its tributaries and provide a host of other benefits.

Unfortunately, there is no centralized data base of scientific literature on habitat restoration design and techniques. We need to learn more about the effectiveness of different kinds of riparian zone vegetation in different geologic conditions. For example are forest buffer strips more effective in removing nutrients than other types of vegetative plantings? Under what conditions? What types of forest cover remove the most nutrients? How much of a buffer strip is needed to prevent or reduce runoff? More information is needed about the hydrology of rivers and streams and the mechanisms by which nutrients are removed. It is these kinds of questions and information gaps which the habitat restoration and enhancement demonstration program authorized in this legislation seeks to address.

Sixth, the legislation authorizes funding to assist in the implementation of specific actions to reduce toxics use and risks throughout the Bay watershed. The 1987 Bay Agreement committed the signatories to the ambitious goal of eliminating all controllable sources of toxics to the Chesapeake Bay and the Bay Program is currently in the process of reviewing the Baywide toxics reduction strategy to better target toxic pollutant problems. One of the most important steps in accomplishing this goal is identifying and quantifying the amount of toxics being discharged into the Bay and its tributaries. The legislation specifically directs the Administrator to assist the States in improving this data collection process and integrating this information into the Chesapeake Bay Program Toxics Loading Inventory. It also directs the EPA Administrator to begin implementing toxics reduction, pollution prevention and management actions, including targeted demonstration projects, to achieve the toxics reduction goals of the Bay Agreement.

The Chesapeake Bay Restoration Act, in my view, represents the third leg of the three-legged stool on which the Chesapeake Bay Program must rest. The first two legs were established in the 1987 Water Quality Act authorization—an authorization for EPA to administer the program and an authorization for grants to the Bay area States which has been used primarily for non-point source reduction efforts. The third leg, which this legislation would authorize, provides the authority and resources that are necessary for Federal agencies to implement the strategies called for under the 1987 Bay Agreement and the 1992 amendments to the Agreement.

The legislation is not intended as an all-encompassing measure which seeks to remedy all of the problems of the Bay. Some of these issues are being addressed elsewhere in the bill introduced by Senator Baucus and Senator Chafee, or in other measures. Rather, the Chesapeake Bay Restoration Act is intended to continue and improve upon the Chesapeake Bay Program that was authorized in the 1987 Clean Water Act. The measure was developed in consultation and cooperation with the signatories to the Bay Agreement and has the strong support of the Chesapeake Bay Commission, the Chesapeake Bay Foundation and the Congressional Delegations from the region. An identical bill has been introduced in the House, with broad support. I ask that copies of letters in support of this legislation be included in the hearing record following my statement.

I hope that the Committee can approve S. 567, the Chesapeake Bay Restoration Act and include its provisions in the new Clean Water Act.

Washington, D.C. 20510

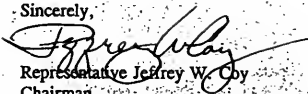

Dear Senator Sarbanes:

I am writing to express the Chesapeake Bay Commission's strong support for the Chesapeake Bay Restoration Act (CBRA) of 1993. As you know, the Chesapeake Bay Commission is a tri-state legislative advisory commission created to assist the General Assemblies of Maryland, Virginia and Pennsylvania in addressing Chesapeake Bay-related issues which are of mutual concern to the three member states. The congressional reauthorization and enhancement of the Chesapeake Bay Program is certainly one such issue.

The Chesapeake Bay Restoration Act of 1993 builds upon the highly successful program authorized in the 1987 Water Quality Act and includes important new federal initiatives in the areas of Federal agency cooperation, coordination and compliance; the conservation and restoration of the tributaries, rivers and streams in the Bay watershed; habitat protection and restoration; population growth and development; and toxics reduction. These are major areas in which we, the states, require additional federal assistance. The legislation provides enhanced resources and new programs that will assist us and other governmental and non-governmental organizations in addressing and meeting the needs for the restoration of the Chesapeake Bay in the years ahead.

The legislation is vital to the continued success of our efforts to protect this national treasure, the Chesapeake Bay. We believe it warrants and should receive the full backing of citizens throughout the Chesapeake Bay watershed. I want to commend you for your leadership in developing this important measure.

Sincerely,

Representative Jeffrey W. Coy
Chairman

Dear Senator Sarbanes:

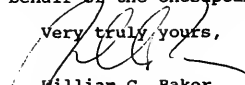

I am writing to express the Chesapeake Bay Foundation's strong support for the Chesapeake Bay Restoration Act of 1993. As you know, I have been concerned about the apparent loss of momentum within the Chesapeake Bay Program in recent months. Although I realize that no single piece of legislation can save the Chesapeake Bay, I believe this bill will shake up and reenergize the Bay program. I am particularly enthusiastic about the new wetlands restoration program. It is time to move beyond simply focussing on preserving our remaining wetlands, and get on with the job of restoring and enhancing the resilience of the Bay.

I am also glad to see the Act's focus on the tributary strategies. This legislation will take us the necessary next step towards true integrated watershed management, an approach pioneered by the Chesapeake Bay Program that is now widely recognized as the only logical way to protect our waterbodies.

Finally, the participation of Federal agencies new to the Bay Program, including the Departments of Transportation and Housing and Urban Development, recognizes the fact that many parts of the Federal government, not just those concerned with the environment, affect the health of the Bay. As we increasingly recognize the linkages between how we use the land and the health of the Bay, these agencies' participation in the Bay Program has become essential.

In summary, this legislation is a definite step forward for the Bay Program, and will aim it in the right direction for the rest of the century. I would like to thank you and your cosponsors for your efforts on behalf of this legislation and on behalf of the Chesapeake Bay.

Very truly yours,

William C. Baker
President

WASHINGTON, D. C. 20001

March 8, 1993

The Honorable Paul S. Sarbanes
United States Senate
Washington, DC 20510

Dear Senator Sarbanes:

I am writing, in my capacity as Governor and Chair of the Executive Council of the Chesapeake Bay Agreement, to commend you for the initiative you have taken to reauthorize and expand federal participation in the Chesapeake Bay program through the introduction of the Chesapeake Bay Restoration Act of 1993. It is time to update the existing federal involvement, and build upon the federal-state partnership we established in the 1987 Chesapeake Bay Agreement. Your legislation opens a new phase in the Bay program and gives the clean up effort an important boost.

The Chesapeake Bay watershed will face increasing environmental threats in the years ahead. In 1992, the Executive Council agreed to amendments that will expand the program to include control of the pollution that flows into the Bay from its major tributaries. This approach will require substantial new efforts to reduce the amount of nutrients that enter the Bay from nonpoint sources. The new efforts are necessary if we are to meet the 40% nutrient reduction goal called for in the Bay agreement.

The cooperation of government at the federal, state and local level will be essential to protecting and restoring the Bay. Your bill helps to establish the blueprint for that cooperation. It also provides for new opportunities on habitat restoration through the creation of low-cost restoration and enhancement demonstration projects. These projects directly address an area that is key to supporting the living resources of the Bay, the main goal of the Bay agreement.

The Honorable Paul S. Sarbanes
March 8, 1993
Page 2-

I also want to thank you, and Charles Stek of your office, for consulting extensively with my Washington Office, Maryland state agencies, the Chesapeake Bay Commission, and all sectors of the Bay community during the process of drafting your legislation. The final product reflects a broad consensus of what needs to be done to build upon the progress we have already made.

I look forward to working with you to ensure the passage of this important legislation.

Sincerely,

Governor

SIERRA

CLEANING UP GREAT LAKES TOXIC WATERS

STATEMENT OF GEORGE COLING
SIERRA CLUB GREAT LAKES SPECIALIST
AUGUST 4, 1993

ON THE NEED FOR A COMPREHENSIVE PROGRAM TO
CLEAN UP CONTAMINATED SEDIMENTS IN THE GREAT LAKES
BEFORE THE SUBCOMMITTEE ON CLEAN WATER, FISHERIES AND WILDLIFE
SENATE ENVIRONMENT AND PUBLIC WORKS COMMITTEE
CHAIRIED BY THE HONORABLE BOB GRAHAM

ON BEHALF OF THE SIERRA CLUB, CITIZENS FOR A BETTER ENVIRONMENT,
COAST ALLIANCE, CONTAMINATED SEDIMENTS WORK GROUP,
GREAT LAKES UNITED,
THE LAKE MICHIGAN FEDERATION,
AND THE LAKE SUPERIOR ALLIANCE

"When we try to pick out anything by itself, we find it hitched to everything else in the universe." *John Muir*
National Headquarters: 730 Polk Street, San Francisco, California 94109 (415) 776-2211

PRINTED ON UNBLEACHED 100% POST-CONSUMER WASTE

I would like to thank the Subcommittee and the chairman for holding this hearing and for leading the effort to clean up the nation's waters.

My name is George Coling, and I am the Sierra Club's Great Lakes Specialist based in Washington. I am testifying today on behalf of the Sierra Club, the Lake Michigan Federation, Citizens for a Better Environment, Great Lakes United, Natural Resources Defense Council, the Coast Alliance, the Contaminated Sediments Work Group and the Lake Superior Alliance. These organizations have appeared many times before Congress to urge a comprehensive program to clean up contaminated sediments that line our harbors and stop additional toxic pollution from sullyng our waters.

It is my pleasure today to voice the strong support of these organizations for the Great Lakes Clean Water Amendments Act of 1993, S. 1183. At the outset, we want to thank Senator Metzenbaum, Senator Glenn and other co-sponsors of the bill for their continued leadership in cleaning up the Great Lakes. These lakes are the largest freshwater ecosystem in the world, and only through the continued leadership of our elected officials will the Great Lakes continue to maintain the vibrant diversity of life and culture around them. We feel that this bill, with the modifications and additions suggested below, offers solid progress in cleaning up the toxic muck that clogs harbors, threatens public health and jeopardizes 2.9 million jobs in fishing, shipping and tourism and \$76 billion of the Great Lakes economy associated with these jobs.

Before specifically commenting on the bill, I wish to emphasize that we view this bill an integral part of a comprehensive, national plan for cleaning up poisoned sediments. On July 1, 1993, Brett Hulse, Sierra Club Great Lakes Program Director, testified before this Subcommittee and outlined this eight point plan. In sum, it is:

1. EPA needs statutory authority to develop a strong national program with deadlines and funding to measure and clean up toxic sediments with strong and practical sediment quality criteria (SQC) so that communities can identify and cleanup toxics sediments in their area. Federal criteria exist for every other major form of pollution. SQC are needed to identify the extent of sediment contamination, to help protect clean areas and promote pollution prevention, to identify critical areas for cleanup, and to determine appropriate methods to manage dredge materials.
2. EPA must develop policies to apply SQC to the states and other programs. States need EPA guidance to apply the SQC to various programs like the NPDES, non-point, ocean and estuarine dumping criteria, and Superfund.

3. EPA should administer a national sediment program to use technologies developed by EPA's Great Lakes (ARCS) program and the Superfund SITES programs to cleanup toxic sites in the Great Lakes and marine sites. This program also needs to test new technologies in critical marine sites in addition to New York/New Jersey harbors which were authorized under section 405 of WRDA of 1992. EPA has bench tested at least five technologies in the Great Lakes but full-scale tests are needed to determine costs and effectiveness before recommendations can be made for full cleanups.
4. Make pollution prevention measures a condition to receive a permit to dispose of contaminated sediments and include pollution and sediment prevention measures in other Clean Water Act programs to reduce further sediment contamination.
5. The EPA/Corps ocean disposal program should be improved since the ocean dumping criteria (as mandated by section 103 of the (MPRSA) lack appropriate thresholds to interpret bioaccumulation test results. This program is being run by the EPA regional office and Corps districts and lacks adequate public review and central management. Clarification of roles are needed.
6. Develop a phase-out period for open water dumping of contaminated sediments in sensitive areas like Lake Superior as called for by the International Joint Commission.
7. Strengthen and enact the Great Lakes Clean Water Amendments to improve sediment management and cleanup in the Great Lakes -- our topic today.
8. Create a funding mechanism to pay for sediment management and clean-up under section 115 of the WPCA or another appropriate section.

Mr. Hulsey's July 1 testimony also outlined our recommendations for preventing further toxic contamination of the Great Lakes, an ecosystem whose management goal, by international agreement, is "zero discharge" of persistent toxic chemicals. I am giving this testimony as a complement to the July 1 recommendations.

BAUCUS CHAFEE BILL: A PROMISING START

The Baucus-Chafee Water Pollution and Control Act of 1993, S. 1114, makes significant progress towards the above needed program and complements the approach in this Great Lakes bill. For example, we applaud the committee's foresight to give EPA clear authority to release sediment quality criteria (SQC) and set deadlines for 8 chemicals, including PCBs and Dioxin within five years. The PCB and dioxin standard are particularly important given the current controversies in New York/New Jersey and Duluth/Superior harbors. But since EPA has five draft criteria pending for release this summer, we feel that they can include up to eight additional

chemicals in that five year period once their protocol for doing SQC is established.

TOXIC HARBORS: A GREAT LAKES PLAGUE

Throughout the Great Lakes, contaminated sediments plague the use of our harbors and waterways. Water use in forty-two of forty-three Great Lakes Areas of Concern is impaired by the buildup of toxic muck. Table 6-5 shows that there are 193 contaminated sediments sites in Ohio (not all in the Great Lakes Basin), and evidence on the ill effects of toxic sediments on smaller lakes in the Basin, such as Onondaga Lake near Syracuse, is building. Persistent toxic chemicals like PCBs, cadmium, dioxin, DDT and other pesticide and mercury befoul the sediments, bioaccumulate through the Great Lakes food chain, vaporize and travel through the atmosphere to pollute more pristine parts of the lakes, and -- in the lack of EPA sediment Quality Criteria -- represent a potential time bomb if they are dredged or removed to another area.

These sediments account for 75% of the PCBs going into Lake Michigan, according to the National Wildlife Federation, they are also the main source of fish contamination in that Lake. According to the EPA National Water Quality Inventory, 1988 Report to Congress, "The main reason for these fishing restrictions is contamination of sediments by toxic chemicals such as priority organics that are, in turn, passed along to macroinvertebrates and fish." (page 35). The 1990 Report to Congress from the same EPA program noted that "...landfills and contaminated sediments are the leading sources impairing the Great Lakes." (page 39). Meanwhile, more and more sediment washes through Great Lakes streams and rivers, picking up unknown loadings of contaminants from a wide variety of agricultural, mining, forestry and industrial sources.

JOBS AT RISK

These toxic sediments are a clear threat to not only the Great Lakes Environment, but also the Great Lakes economy. Tourism is now the second largest sector of the economy in Ohio and many Great Lakes states. Yet this economy is threatened by continued contamination. Nitrate pollution and persistent toxics levels for PCBs and dioxin are increasing in several lakes. Table I-2 shows the persistent toxic levels of PCBs in coho salmon in all the Great Lakes. These levels are over 70 times EPA's 1/100,000 cancer risk level and may cause thousands of cancer cases each year.

In June, Sierra Club recently released its Clean Lakes, Clean Jobs study that documents the jobs and money at risk if we fail to cleanup the toxic blobs that rest at the bottom of every Great Lakes harbor. Billions of dollars and thousands of jobs are at risk if toxics are not cleaned up (see table).

GREAT LAKES JOBS AT RISK

	JOB	COSTS
HEALTH	*	\$18.47 Billion
FISHING	89,000	4.0 Billion
SHIPPING	44,000	3.5 Billion
TOURISM	2,760,000**	69.0 Billion
TOTAL	2,893,000	\$94.97 Billion

[* complete data unavailable; ** assumes \$25,000/direct job]

Great Lakes tourism is the most threatened industry. Tourism is a \$69 billion industry in the Great Lakes Basin and the number two industry in several states. In Ohio, Lake Erie recreation industry accounts for \$8.5 billion and 152,000 jobs.

Approximately 89,000 fishing jobs and more than \$4 billion in commercial and sport fishing proceeds are in jeopardy. There are more restrictions on fish consumption in the Great Lakes than anywhere in the United States, 1,000 of the nation's 1,400 fishing restrictions -- five in seven -- come from Great Lakes states. As the EPA said, these are largely a result of sediment contamination.

Also at risk are more than 44,000 shipping jobs and \$3.5 billion in personal and corporate income, including state and local taxes paid by the ports. Contamination and lack of a national program to deal with this toxic muck prevent safe dredging in half of all Great Lakes harbors where sediments cannot safely be dredged.

Because communities cannot safely dredge this toxic sediment, barges must lightload their cargos an average of 480,000 pounds. This means lost profits and jobs in the millions for the entire Great Lakes Basin.

If you extrapolate these risks to the country at large and three other coasts, the potential job risk could be near 10 million and the commerce at risk could be near \$400 billion. That justifies an aggressive national program to identify and clean these sites. While the price tag for cleaning up all Great Lakes seems expensive -- \$10 billion by some estimates -- the potential of creating 400,000 jobs in depressed areas of the Great Lakes is enormous.

According to the EPA National Water Quality Inventory, 1990 Report to Congress, 67.7% or 3,288 miles of Great Lakes shoreline do not support Clean Water Act designated uses. Only 1.8% or 85 miles

fully support Clean Water Act designated uses for fishing and swimming. None of the shoreline in Wisconsin, Illinois, Indiana, Michigan, and Ohio supports full Clean Water Act designations.

Designated Use Support in Great Lakes

State	Great Lake Shore Miles	Shore Miles Assessed		Miles Fully Supporting	Miles Threatened	Miles Partially Supporting	Miles Not Supporting	
		Total	Percent Evaluated					Percent Monitored
Illinois	63	63	0	100	0	54	9	0
Indiana	43	43	0	100	—	—	43	—
Michigan	3,288	3,288	0	100	0	—	—	3,288
New York	577	577	100	0	85	15	477	0
Ohio	236	236	—	—	0	—	236	0
Wisconsin	650	650	100	0	0	0	650	0
Totals	4,857	4,857			85	69	1,415	3,288
Percent of Assessed Waters					1.8%	1.4%	29.1%	67.7%

ARCS: A GREAT LAKES SUCCESS STORY

We have several successful programs to address Great Lakes sediment pollution, like the Assessment and Remediation of Contaminated Sediments (ARCS) Program, set up under Section 118 of the 1987 Clean Water Act Amendments and the Great Lakes Critical Programs Act. These provide key demonstration programs and deadlines to test technologies and complete the Remedial Action Plans (RAP).

Sierra Club participates the ARCS Citizen Work Group, I can report some progress on this program -- five pilot treatments were tested last summer with some promising results. In the laboratory, over 10 technologies were tested. ARCS also did five in-depth contaminant assessments from Buffalo, Ashtabula, Saginaw, Indiana Harbor, and Sheboygan harbors. But these plans and tests are only that. We need a concrete program to clean up these 27 toxic Great Lakes hotspots and many others in ports around the country.

GREAT LAKES CLEAN WATER AMENDMENTS ACT: A NEEDED STEP

The Clean Water Act reauthorization presents a perfect opportunity to make additional progress in the Lakes (and throughout the nation). The Great Lakes Clean Water Amendments Act of 1993 is the basis for doing so. We urge that this bill, with the specific modifications and additions noted below, be merged with the Clean Water Act reauthorization vehicle.

Before discussing these points, I wish again to commend the authors of this bill for an well-crafted approach in identifying the sources of sedimentation, for their promising strategy for dealing with the contentious issue of confined disposal facilities and for their general leadership.

SPECIFIC MODIFICATIONS AND ADDITIONS NEEDED

Sierra Club and the other organizations represented in this statement offer the following comments on S. 1183.

MODIFICATIONS

Section 4: Include the possibility of adding more full scale demonstration projects in the program. The extensive mass-balance study done on Green Bay and other information may demonstrate enough knowledge to readily make the transition to a full-scale remediation within the time frame of the bill. Other sites for full-scale clean up might emerge, and EPA should be given latitude and encouragement to do more than five full-scale remediations. A change in the wording of line 24 of page 23 to, adding "...at least 5 full scale..." would provide sufficient latitude, but Congress should require an EPA report either directly to Congress or as a finding on whether or not other sites have been chosen and the rationale for this choice.

Section 4: Shorten the times for EPA's completion of pilot scale demonstrations and assessments. We suggest shortening the time frame for this work by three years. The success of the present ARCS program and the on-going work on the full-scale remediations should make the suggested time frame feasible. The pace of clean up must reflect the gravity of the environmental problem. EPA may need an increase in appropriations to the Great Lakes National Program Office to proceed at this pace, but this appropriation is a investment in the health of the Great Lakes economy and the health of its people that is well worth making.

ADDITIONS

Section 4. Broaden the application of assessments and pilot scale studies. We urge that the bill direct EPA to make assessments at and test more clean up technologies on a pilot scale at sites others than the present Areas of Concern. First of all, other Areas of Concern might be specified under the provisions of the Great Lakes Water Quality Agreement. Secondly, other sites, whether or not they have AOC status, will undoubtedly need at least pilot scale demonstration over the next several years. Specific candidates are Lake Calumet at Chicago, the focus of continued planning for its remediation and economic development of areas around it, and Onondaga Lake at Syracuse, subject of a management strategy under the 1990 Great Lakes Critical Programs Act. This legislation should provide for the transition from planning to remediation of Onondaga Lake and the application of what we have learned from ARCS to Lake Calumet and other appropriate lakes and waterways, not in the designated Areas of Concern.

New Section: Set a statutory deadline for completion of Phase II of EPA's Great Lakes Initiative. Another major success in the history of Great Lakes clean up is EPA's proposed Great Lakes Initiative. This proposed federal rule would provide for uniform water quality standards in each Great Lakes, levelling the economic playing field and adding stability to our Industrial Heartland. The Initiative would also require that bioaccumulation of persistent toxic chemicals, protection of vulnerable at-risk groups and other measures that build on the best science be used to provide much more stringent standards to safeguard the health of the present and future generations of people in the Great Lakes. The GLI is affordable. It is an investment that the nation must make to protect the largest freshwater ecosystem on the planet. Indeed, EPA is holding hearings on this rulemaking in Chicago today and tomorrow, and other environmentalists are speaking to the merits of this precedential rulemaking.

However, the scope of the present GLI includes only point source discharges. Sources for contaminated sediments, airborne toxics, polluted runoff and other source of chemical contamination of the Great Lakes has been assigned to a second phase of rulemaking, called the Toxic Reduction Initiative. We urge that the Great Lakes Clean Water Amendments Act put a statutory deadline on the completion of the Toxic Reduction Initiative. We suggest a proposal date of September 30, 1995, and promulgation date of December 31, 1996.

EPA deserves great credit for conceiving the Great Lakes Initiative as follow through on the 1987 revamping of the Great Lakes Water Quality Agreement. Nevertheless, the present GLI rule was moving slowly through the EPA until the 1990 Great Lakes Critical Programs Act specified a proposal date of June 1991. Even with that statutory dead line, it took a National Wildlife Federation lawsuit to force the proposal to be issued on March 31, 1993. Again, rulemaking must proceed according to the gravity of the environmental concern. The concern is grave, regulations for many of the sources of Great Lakes of pollution will be outmoded -- less than state of the science -- as soon as Great Lakes Initiative I is promulgated. Equity demands that EPA expeditiously address these other sources. Congress needs to set a statutory framework to marshal EPA's resources this expeditious pace.

Make Lake Superior a world-class pristine water body. We urge Congress to make Lake Superior a world-class demonstration area for zero discharge of persistent toxic chemicals. This action to implement the Great Lakes Water Quality Agreement follows through on the cogent 1991 recommendation of the International Joint Commission and strengthens the US Canada binational action plan for Lake Superior. Congress should stipulate that all of Lake Superior is an Outstanding Natural Resources Water under the Clean Water Act.

Any of our organizations may have more comments on the details of the legislation and communicate them to you by letter.

CONCLUSION

In conclusion, this year's Clean Water Act reauthorization and introduction of the Great Lakes Clean Water Amendments Act gives us the opportunity to stop additional persistent toxics from entering the Great Lakes and other waters of the United States and to clean up the current toxic hotspots. We look forward to working with the Senate, EPA and interested parties to respond to the moral imperative of protecting and restoring the precious Great Lakes for generations to come.

This is taken from EPA National Water Quality Inventory, 1990 Report to Congress, page 96

Table 6-5. Sediment Contamination Reported by States

State	Number of Sites	Contaminants Identified
Alaska	1	Aromatic hydrocarbons
Arizona	6	Pesticides, metals (boron, chromium, selenium), radiochemicals
California	1	Mercury
Connecticut	6	Lead, polychlorinated biphenyls (PCBs), organic chemicals, and other metals
Delaware	2	Metals
DC	—	Lead, cadmium, zinc, chlordane, DDT
Florida	—	—
Hawaii	1	Arsenic
Illinois	—	Heavy metals, DDT, PCBs, heptachlor epoxide
Indiana	8	Metals, polynuclear aromatic hydrocarbons (PAHs), cyanide, other organics
Iowa	1	PCBs
Kentucky	1	PCBs
Louisiana	7	Priority organics, creosote, metals, oil and grease, PCBs
Maine	7	Dimethyl formamide, toluene, trichloroethane, chlorinated solvents, tris (2,3-dibromopropyl) phosphate, PCBs, copper, cadmium
Maryland	—	Nickel, zinc, PAHs, non-DDT chlorinated pesticides, pesticides, DDT, PCBs and other metals
Massachusetts	13	Metals, priority organics, oil and grease
Michigan	13	Mercury, alkylated lead, PCBs, dioxin, benzo(a)pyrene, hexachlorobenzene (HCB), DDT, dieldrin, toxaphene, mirex
Minnesota	1	Mercury, PCBs, coal tars
Nevada	7	Mercury and other metals
New York	21	Priority organics, metals, pesticides
Ohio	193	Arsenic, cadmium, chromium, copper, lead, zinc
Oklahoma	10	Mercury, lead, zinc, chlordane, hydrocarbons, PCBs
Oregon	14	Arsenic, cadmium, chromium, copper, lead, nickel, zinc, DDT, PAHs, PCBs, phthalates, cyanide, volatile organic compounds, phenanthrene, pentachlorophenol
Rhode Island	—	—
South Carolina	2	PCBs, chromium, mercury
South Dakota	4	Mercury
Virginia	31	Selenium, chromium, arsenic, iron, manganese, nickel, cadmium, zinc, copper, mercury, lead
Virgin Islands	10	Mercury, copper, selenium, cadmium, nickel, zinc
Wisconsin	24	PCBs, dioxin, mercury, pentachlorophenol, arsenic, cadmium, chromium, zinc, oil and grease, pesticides, PAHs

STATEMENT OF WILLIAM C. BAKER, PRESIDENT, CHESAPEAKE BAY
FOUNDATION, ANNAPOLIS, MARYLAND

Mr. Chairman, members of the Committee, thank you for the opportunity to appear before you today. My name is William C. Baker; I'm the President of the Chesapeake Bay Foundation (CBF), a non-profit environmental organization founded 27 years ago and dedicated to restoring and protecting the Chesapeake Bay and its resources. We have over 87,000 members from all fifty states and 14 foreign countries. (In Texas, for instance, we have 50 members.) This diverse membership reflects the fact that the Chesapeake Bay is not only a worldwide treasure, but a national and international model for the restoration of our coastal waters. The program to restore the Bay is an effort involving the combined activities of federal, state, and local governments, as well as those of concerned citizens from all sectors of society. It is important to remember the Chesapeake Bay of 27 years ago. Even then, the words of H.L. Mencken, who called it "an immense protein factory," rang true. A quarter of a century ago, the Chesapeake produced one quarter of the nation's oysters, one half of all hard crabs (100 million pounds in a good year), and a staggering 95% of all soft crabs consumed in the United States. In addition, nine out of every ten striped bass caught from North Carolina to Maine were born in the Chesapeake Bay.

Today, the Bay is a far different place. For the first time ever, the Gulf Coast catch of blue crabs has exceeded the Chesapeake. Overfished, over fertilized with nitrogen and phosphates, poisoned with toxins, stripped of much of its valuable habitat, the Bay can be described as "degraded," "abused," and "polluted." But it is not dead. A decade of intense public and private effort to save the Bay has produced some signs of improvement and many signs of hope.

In assessing where we are today, and where we would like to be in ten years, it's important to remember how far we've come. A great deal has been achieved since 1983 which gives us confidence that by 2003 we can make just as much progress—if we identify where we want to go as boldly as we did ten years ago.

When the Chesapeake Bay Agreement was put in place in 1983:

- Detergents still contained phosphates
- The damaging impacts of nitrogen in the Bay were largely ignored and misunderstood
- No sewage treatment plants were designed to remove nitrogen
- Rockfish were almost commercially extinct, with a moratorium yet to come
- Fisheries management plans were a theoretical ideal
- Critical areas land use legislation was a just a proposal
- Agricultural programs focused almost exclusively on soil erosion
- Pollution prevention wasn't even discussed
- Pennsylvania wasn't a member of the Chesapeake Bay Commission

We now consider most of these issues routine; for example, we are debating the best way of achieving nitrogen removal from sewage treatment plants, not its necessity. We can't understand all the fuss about the phosphate detergent ban. And Pennsylvania is a full and complete partner that has most recently taken a leadership role on nutrient runoff from agricultural lands thanks to legislation sponsored by Representative Jeff Coy. It is important to keep this ten-year perspective in mind. A great deal can be achieved if we set our sights high and work together. But it is also clear that we have a long way yet to go. We cannot afford to reach only for what appears easy to achieve in the short term.

The primary Bay jurisdictions—Pennsylvania, Maryland, Virginia, and the District of Columbia—have spent hundreds of millions of their own dollars on restoring the Bay. But the Federal government's role in the Bay cleanup may be the linchpin. The funds provided by the EPA each year bring the Bay states to the table, where they can identify common concerns and develop common strategies to deal with the Bay's problems. This multi-state, team approach, almost unheard of ten years ago, minimizes finger pointing, and has resulted in the active involvement of one state—Pennsylvania—that doesn't even share a foot of the Bay's shoreline. Pennsylvania's participation, and even leadership on certain issues, is evidence of the power of the watershed approach to problem solving.

The Chesapeake Bay Foundation strongly supports the Chesapeake Bay Restoration Act of 1993 introduced by Senator Sarbanes with the full support of the Bay delegation. Although I realize that no single piece of legislation can save the Chesapeake Bay, I believe this bill will substantially advance the Bay cleanup. I am particularly enthusiastic about the new wetlands restoration program. It is high time to move beyond simply focussing on preserving our remaining wetlands, and get on with the job of restoring and enhancing the resilience of the Bay.

I am also glad to see the Act's focus on the tributary strategies. This legislation will take us the necessary next step towards true integrated watershed management, an approach pioneered by the Chesapeake Bay Program that is now widely recognized as the only logical way to protect our waterbodies.

Finally, the participation of Federal agencies new to the Bay Program, including the Departments of Transportation and Housing and Urban Development, recognizes the fact that many parts of the Federal government, not just those concerned with the environment, affect the health of the Bay. As we increasingly recognize the linkages between how we use the land and the health of the Bay, these agencies' participation in the Bay Program has become essential.

In summary, this legislation is a definite step forward for the Bay Program, and will aim it in the right direction for the rest of the century. Despite the value of the Restoration Act for the Bay, however, it is the language in the rest of the Clean Water Act that can make or break the cleanup. The issues you are debating—wetlands protection, combined sewer overflows, water quality standards, sewage treatment—are all pieces of the puzzle that must be assembled to restore the Chesapeake Bay. Polluted runoff—nonpoint source pollution—is one of the most pressing, and most difficult, water pollution issues that still needs to be addressed.

The Water Pollution Prevention and Control Act of 1993 (S. 1114) being discussed in this committee has many features we support. For example, it clearly embodies the concept that the most effective way to deal with pollution from toxic substances is to keep them out of discharges. It establishes stronger programs to deal with polluted runoff, including mandatory programs for impaired watersheds. It elevates the watershed to its appropriate position in the Clean Water Act, the focus for planning and implementing restoration programs. As you debate these and other issues related to the Clean Water Act, I hope you will remember the very real places—including the Chesapeake Bay—whose health depends on your actions.

The Chesapeake Bay watershed consists of some 64,000 square miles. Every drop of stormwater that washes off that vast area heads straight for the Bay. The watershed is now home to some 15 million people in six states and the District of Columbia, twice what it was before World War II. In order to restore the Bay, it will be necessary for us to reduce our cumulative impacts. This is a daunting challenge, because the population is conservatively projected to grow by 20% over the next 25 years, a one-third increase in the number of households. That population growth is the equivalent of the entire state of Mississippi picking up and moving to this area, with the corresponding demand for housing, roads, places to work, schools, sewage treatment plants, and so forth. In order to achieve a net improvement in the Bay, we will have to effectively accommodate this growth with NO additional pollution, or greatly increase per capita reductions in the impacts of existing residents. Just as the year 2000 once represented the distant future, the year 2020 will be upon us before we know it, and our children and grandchildren will be debating the implications of the projections for the year 2050. How we plan for the next 30 years will determine the nature of that debate, just as this discussion is largely the result of decisions made in the last 30 years.

It may sound presumptuous to say this, but the fact is that the world is watching us here in the Chesapeake Bay region. Every week, our offices are contacted by visitors from all over the world. In the past six months, we've hosted visitors from Great Britain, Japan, the former Soviet Union, Nepal, New Zealand, India, Peru, South Korea, Germany, Bulgaria, Poland, the Czech Republic, Hungary, Slovakia, Brazil, the Baltic Republics, Finland, and Sweden. This November, the Chesapeake Bay will be the centerpiece of the International Conference on Environmental Management of Enclosed Coastal Seas to be held in Baltimore, Maryland. Other estuaries around the country, as well as other environmental groups, look to the Bay as well. The National Estuary Program is modelled after the Chesapeake Bay Program; environmental groups, such as the Galveston Bay Foundation, have been modelled after the Chesapeake Bay Foundation. We in this region are indeed blazing a trail for the rest of the nation, even the world. I urge you to incorporate the Chesapeake Bay Restoration Act into the amended Clean Water Act. When you do that, please consider formally designating the Chesapeake Bay as "THE NATION'S ESTUARY," for that is what it truly is—a natural resource of singular importance to the nation.

Lately, when asked how the Bay is doing, I have said that the patient is stabilized, and that we are poised on the brink of real recovery. I do not mean to minimize the challenges we face; as I've discussed above, they are formidable. But do we really have any choice?

The Chesapeake Bay lies in the heart of this great nation's mid-Atlantic region. Washington, D.C., the Capitol of the world's last super power, is both geographically

and historically central to the Chesapeake Bay. The fifteen million people who live in the watershed have repeatedly and overwhelmingly demonstrated their commitment to Saving the Bay. In fact, love for the Bay may just be as close as we will come to establishing an environmental ethic.

We have a great federal, state, local partnership at work here on the Chesapeake. The cooperation is historic. We must set our sights high; we must look to restore, not just maintain, the Chesapeake Bay. For if we cannot do it here, with all that we have going for us, we must ask what hope is there for the rest of the planet.

Thank you.

STATEMENT OF JEFFREY COY, PENNSYLVANIA HOUSE OF REPRESENTATIVES, CHESAPEAKE BAY COMMISSION

Mr. Chairman and members of the Committee, my name is Jeffrey Coy and I am a member of the Pennsylvania House of Representatives and Chairman of the Chesapeake Bay Commission. The Commission is a tri-state legislative advisory commission that was created over a decade ago by the legislatures of Maryland, Virginia and Pennsylvania to assist the states in addressing Chesapeake Bay-related issues of mutual concern. The commission is a signatory to the 1983 and 1987 Chesapeake Bay Agreements along with the Governors of Maryland, Pennsylvania and Virginia, the Mayor of the District of Columbia and the Administrator of the U.S. Environmental Protection Agency. Of the six signatories, the Commission is the only signatory representing the legislative branch of government. Functioning as the legislative arm of the clean-up effort, it is the Commission's responsibility to work with both the state legislatures and the Congress on programs to restore Chesapeake Bay. It is in that capacity that I am before you today.

The Commission also provides an important tri-state perspective for the restoration effort. The wisdom and strategies that are exchanged by the delegations from the three states are vital in moving the program forward.

I am honored to be here today as Chairman of the Chesapeake Bay Commission, representing my friends and colleagues from the legislatures of Pennsylvania, Maryland and Virginia and the other members of the Chesapeake Bay Commission to support reauthorization of the Clean Water Act which should include the provisions of the Chesapeake Bay Restoration Act and to emphasize the important role of the federal government as a partner with the states and the District of Columbia in the restoration of Chesapeake Bay.

First, I would like to share a few comments concerning the broader picture—the critical importance of the reauthorization of the Clean Water Act. For almost two decades, the Water Pollution Control Act has been regarded as landmark legislation aimed at improving, protecting and restoring water quality throughout the nation. The Act has served both as a vehicle for providing financial assistance to the states in areas such as the construction and expansion of wastewater treatment facilities and has provided by example the incentive or impetus for many of the water quality programs which we have undertaken at the state level.

We commend you for your foresight in pursuing the re-authorization and strengthening of this vital legislation. Virtually every element of the Clean Water Act enhances and supplements our efforts to protect and restore the Chesapeake Bay. The Act's continued support for sewage treatment plants and controls on toxic pollutants will reap significant benefits in the Bay. I am particularly pleased to see the nonpoint source pollution control provisions of the Act strengthened and reemphasized. We have found, as have other across the nation, the control of runoff and other nonpoint sources, is a vexing and expensive problem. I think it is fair to say that we have made real progress in the Bay region, but continued emphasis at the federal level can only help.

While I am sure the committee is aware of the problems facing Chesapeake Bay, let me briefly review its condition. While we have made significant advances in the 10 years since the first Chesapeake Bay Agreement was signed, it is fair to say that we have a long way to go. We have made progress with significant reductions in the nutrient phosphorus entering the Bay because of a number of initiatives including phosphate detergent bans, improvements in sewage treatment plants and controls on runoff from agricultural and urban lands. Improved water quality in many areas has led to slow but steady improvements in underwater grasses which are vital habitat and nursery areas for a myriad of Bay species. Striped bass, known around the Bay as rockfish, have rebounded. But problems remain: we continue to have difficulty in controlling excess nitrogen, although increase have been slowed, critical habitats such as wetlands are still under pressure and we still need to understand

and remedy toxics problems that exist in the waters and the sediment of the Bay. Our fisheries continue to decline and we face an expanding human population in the watershed that will continue to stress the Bay and its resources.

There are good reasons why we have come so far and why there is reason for optimism about the future. The current Chesapeake Bay Agreement, signed in 1987 and amended in 1992 has provided clear, strong specific and comprehensive goals for the multi-jurisdictional Chesapeake Bay Program and those goals have been embraced by the highest levels of leadership in the region. We have, under the rubric of the Chesapeake Bay Program, brought together not only the states, the district, the commission and EPA but thousands of citizens, scientists, business leaders, local governments, farmers and others to work for common goals. We have been guided by state of the art research and have used a computer model for management that is arguably one the most sophisticated in the world. We have also not rested on our accomplishments. The participants in the Chesapeake Bay Program have not been shy about reassessing our commitments in the face of new scientific evidence and to move to new areas and abandon those that are not productive. We have also recognized that there is not one monolithic approach that works in all areas. With a watershed that spans multiple states and thousands of local jurisdictions, success comes only be recognizing regional difference and therefore the tools we have employed a range of programs that range from regulations to voluntary incentive based programs.

Throughout the Bay region, the environmental professionals, the politicians and the public at large all recognize and appreciate the importance of continued involvement of the federal government in our efforts. Your interest in and support for the Chesapeake Bay has been not only a catalyst, but also an incentive and an inspiration to our state and local governments. The recognition of the Chesapeake Bay as a resource of national significance, and your financial support for this program since 1984 have provided a vital underpinning for this entire effort. It has enabled the states to adopt programs which would not otherwise be possible. The active involvement of EPA and other federal agencies has leveraged hundreds of millions of state and local dollars. The states have taken seriously their obligations and have responded with significant investments of time and money. Since the beginnings of the program in the late seventies and the early eighties federal assistance to the Bay region has grown substantially. It now amounts to more than \$20 million dollars annually, with over 60% of the figure going to on the ground implementation programs. While this money is vital, it is dwarfed by the total expenditures on Bay-related initiatives of states and the District of Columbia. In my own state of Pennsylvania, as in Maryland, Virginia and the District of Columbia, federal money provided by the Bay Program has helped established the groundwork for important initiatives:

Pennsylvania is blessed with a strong agricultural economy, however, excess nutrients produced by agricultural operations have proved to be a major water quality problem for the Susquehanna River and ultimately Chesapeake Bay. Money for the Bay program, some 12 million dollars since 1987 and supplemented by 17 million dollars of state money, has given us the ability to give grants to farmers to install best management practices and build manure storage facilities to help control nutrients. Earlier this year, the Pennsylvania legislature, with the support of both environmental and agricultural interests, adopted landmark agricultural nutrient management legislation which I introduced on behalf of the Pennsylvania delegation to the Chesapeake Bay Commission. I firmly believe that part of the success of that legislation came from the knowledge about and acceptance of farming practices that were funded in part by the Chesapeake Bay Program.

In your considerations of the Clean Water Act and the incorporation of the provisions of the Chesapeake Bay Restoration Act, you will have yet another opportunity to express your support for the type of inter-jurisdictional and interdisciplinary management structure which we have put in place in this region. As you consider the reauthorization of the Clean Water Act, I urge you also to view the Chesapeake Bay as a microcosm of the water quality problems confronting our nation. I am certain that there is no problem unique to the Chesapeake Bay. The Bay's problems are the nation's problems. And therefore, many of our solutions we embrace will benefit the nation.

In closing, I would only say that I cannot emphasize too strongly the importance which the Chesapeake Bay community attaches to your efforts here. I believe that you have before you an opportunity to signal to the citizens of the Bay region, and to the nation at large, your continued commitment to the protection of this nation's most productive estuary. The Chesapeake Bay restoration effort is a state-of-the-art

experiment in environmental protection which deserves and demands your continued support.

Thank you the opportunity to be with you today.

REMARKS TO THE SENATE COMMITTEE ON
ENVIRONMENT AND PUBLIC WORKS
REGARDING THE REAUTHORIZATION OF THE CLEAN WATER ACT

Deputy Secretary Caren E. Glotfelty
Pennsylvania Department of Environmental Resources
August 4, 1993

Mr. Chairman and members of the Committee, my name is Caren Glotfelty, and I am Deputy Secretary for Water Management of the Pennsylvania Department of Environmental Resources. In this position, I am responsible for all water quality and water quantity programs in Pennsylvania, including the Commonwealth's participation in the Chesapeake Bay Program.

I appreciate the opportunity to speak to you today on Senate Bill #1114, concerning reauthorization of the Clean Water Act. I have been asked, specifically to discuss the Chesapeake Bay Program -- The lessons we have learned from the program that should be applied elsewhere and provisions that should be included in this Clean Water Act to insure the continued success of the Chesapeake Bay Program and watershed planning efforts elsewhere.

Although the area in Pennsylvania drained by the Chesapeake Bay occupies only about a third of the Commonwealth's total land, the Chesapeake Bay Program has taken on an importance in Pennsylvania, as it has in the entire country, beyond the geography it directly affects. Since the initial Bay Agreement in 1983, the Chesapeake Bay Program has established itself as the preeminent watershed restoration, protection, and management program in the United States. The Chesapeake Bay Program has been a laboratory for watershed management approaches that are serving as models elsewhere.

Congress had great foresight in 1987, to include specific authorizing language for the Chesapeake Bay Program in the Clean Water Act Amendments. Now that the Clean Water Act reauthorization is again a topic for Congressional action, it is timely to reflect on what we have learned from the Bay Program over the last six years. What has worked well? What are essential elements for continuing success?

WHAT HAVE WE LEARNED FROM THE CHESAPEAKE BAY PROGRAM?

Partnerships with Agriculture are Necessary

In 1987, the signatories to the Chesapeake Bay Agreement committed to reduce the loads of phosphorus and nitrogen (nutrients) entering the Bay by 40 percent by the Year 2000. In Pennsylvania we focused on reducing agricultural sources of nutrients, the primary contributors of nitrogen and phosphorus to the Susquehanna River. To accomplish this challenging task, we built a strong and lasting partnership between the environmental and agricultural communities.

Initially, we relied on a voluntary approach to agricultural nutrient management. Pennsylvania's Chesapeake Bay Program used education, technical outreach, and financial assistance to persuade farmers that nutrient management is not only environmentally responsible, but can be profitable as well. Our partnership with agriculture has led this

year to the passage of Act 6, which requires the preparation and implementation of nutrient management plans by high density livestock farms. This new law was the result of the major farm organizations in Pennsylvania recognizing that nutrient management was essential to the future of agriculture in the Commonwealth, and that a voluntary program alone was not sufficient.

Pennsylvania's nutrient management program, while mandatory, is not a traditional regulatory program. It requires the preparation of a plan which takes into account the farmer's crop needs, soil nutrient content, available manure, and farming practices. The site specific nature of nutrient management planning allows the farmer to integrate appropriate management practices into the normal farming operations.

The program will be administered through the county conservation districts, traditional allies to farmers. I believe that Pennsylvania's example could and should spawn a whole new generation of legislative approaches that rely less on "command and control" and more on shared goals, education, cooperation, and technical assistance.

Local Solutions are Needed to Regional Problems

Another lesson learned from the Chesapeake Bay Program has been the importance of employing strategies to build support at the local level for solutions to regional problems. With the 1992 Chesapeake Bay Agreement, the signatories embarked on the development of tributary-specific strategies. Until that time, most attention in the Program focused on the main bay. It finally became clear that without specific attention to the tributaries -- that is, to activities throughout the entire watershed -- we could not accomplish the task of the 40 percent nutrient reduction agreed to in 1987.

The four jurisdictions that have signed the Chesapeake Bay Agreements -- Maryland, Virginia, Pennsylvania, and the District of Columbia -- vary considerably in their geography, population, development, and in the activities that contribute to the Bay's nutrient problems. Accordingly, their solutions and their priorities must be different. In recognition of this, each of the jurisdictions has spent the last eight months in extensive rounds of public meetings, developing local solutions which are most appropriate and cost-effective in accomplishing the agreed-upon nutrient reductions. The key to the success of these various efforts to accomplish Bay restoration is that they are all tied into the accomplishment of a set of common goals for the Bay and watershed as a whole.

Tangible, Measurable Goals are Essential

From in Chesapeake Bay Program, we also have recognized the value of setting these tangible, measurable goals on a watershed basis. The notion that the Bay could be restored to the water quality of an earlier time through specific numerical reductions in nutrient loadings has had a tremendous effect in capturing and holding the

public's attention. More recently the Program has been able to limit water quality restoration to the return of specific amounts of bay grasses, and is moving toward the ability to scientifically link water quality improvement to the return of other living resources. The power of such tangible goals is such that, even in Pennsylvania, with no Bay shoreline, the public has retained its interest in, and strengthened its commitment to, Chesapeake Bay restoration for more than ten years.

Watershed Planning is Essential for Meaningful Water Quality Improvement

The Chesapeake Bay Program initially focused on traditional concepts of water pollution control. The impacts of air pollution were not well understood. It is now recognized that 25 percent or more of the nitrogen contributions to the Chesapeake Bay come from atmospheric deposition. As such, water quality improvements will require air pollution reductions as well as reductions in point source discharges from industries and municipalities and non-point source discharges and point source from agriculture urban storm water.

The success of the Chesapeake Bay Program is a strong demonstration that integrated watershed planning and management is the direction in which we should be going in all geographic areas. Only through concerted action by all jurisdictions and in all media -- air, water, and land -- affecting this Bay -- will we be able to make this progress necessary to restore living resources to this Bay.

These lessons from the preminent watershed restoration, protection, and management program should be remembered as Congress moves toward the idea of watershed management on a cross-media basis nationwide.

It is also important that any mandated approach to watershed planning and management be flexible. Interstate and intrastate agencies already engaged in effective watershed management should be allowed to continue without interference. New organizations should have this flexibility to design and implement watershed management approaches that fit the needs and circumstances of the resources and jurisdictions involved.

WHAT IS NEEDED IN THE CLEAN WATER ACT REAUTHORIZATION?

Retain Emphasis on Nutrient Reductions

With the first Chesapeake Bay Agreement, in 1983, nutrients were identified as the culprit causing the Bay's decline in living resources. In 1987, although other environmental goals were set, there was a strong and specific emphasis on nutrient reductions. Because we have been somewhat single-minded until now, the jurisdictions have largely targeted their resources toward actions necessary to reduce nutrients. With the 1992 Agreement, the jurisdictions enlarged their perspectives to include the tributaries, but the emphasis remained on nutrients.

As we have learned more about the Bay and its tributaries, we have identified additional problems to tackle including the restoration of Bay grasses, and wetlands, remediation of toxic chemicals trapped in

bottom sediments, and rejuvenation of the striped bass, oyster, and crab fisheries. It has been tempting to declare the nutrient problem well on its way to solution and to move on to other problems. Partly this is because we are impatient for the complete solution, and partly because we are concerned about maintaining the public's focus on and support for the Chesapeake Bay Program.

However, it is clear that achieving the necessary nutrient load reductions will take many years and billions of dollars. For example, preliminary cost estimates for the Potomac River, a major tributary to the Bay, indicate that it may take \$155 million to \$244 million per year for an indefinite period to remove the necessary amounts of phosphorus and nitrogen from point and non-point source discharges to achieve and maintain the 40 percent Baywide load reduction goal. We need to be able to count on sufficient funding to accomplish this goal and cannot afford to have the necessary financial resources or public attention diverted from nutrients until these reductions are accomplished.

Maintain Implementation Flexibility

Perhaps the most critical factor in the success of the Chesapeake Bay Program to date has been the flexibility afforded the jurisdictions who are responsible for implementing the Program in targeting their resources to meet the broad Baywide goals. Although we are all part of a single watershed, Maryland, Virginia, Pennsylvania and the District of Columbia are all very different in terms of the impacts we have on the Bay, the resources we have available to solve Bay problems, and the other priorities we must balance with the needs of the Chesapeake Bay.

The implementation grants to the jurisdictions have been substantial, and more will be required. In Pennsylvania, we have spent most of our \$12 million implementation grants, since 1987, on the agricultural nutrient problem -- with most of the dollars going into cost-sharing best management practices on farms. In other jurisdictions, other priorities have received funding.

It is crucial that this flexibility to the jurisdictions be maintained in the future as we focus more on tributary-specific strategies. This flexibility is essential not only for how we spend our dollars, but in the kinds of solutions we choose. Particular implementation strategies, practices, and techniques should not be dictated to the implementing jurisdictions. Rather, we should continue to be permitted to choose our own approaches to meeting broad Bay goals and to be judged on our performance in meeting those goals.

Emphasize Cost-Effective and Pollution-Preventing Solutions

The Bay jurisdictions should be required to invest in solutions that are the most cost-effective and equitable from a comprehensive standpoint and that emphasize pollution prevention and recycling. Pennsylvania's nutrient management program is a good example of this. Farmers are encouraged to use their manure resources efficiently,

reducing their dependence on expensive chemical fertilizers, which will both help their economics and reduce pollution from improper agricultural nutrient use.

Recognize Competing Priorities at National Level

A final concern to us in Pennsylvania is the need for Congress to understand that there are a number of watershed programs of national priority which are competing for our resources and attention. In addition to our involvement in the Chesapeake Bay Program, Pennsylvania has been an active participant in the Great Lakes Water Quality Initiative and a strong partner in the Delaware Estuary Program. If all of these watershed restoration, protection and management programs are to produce results, and if our many other state level water quality management responsibilities are to be maintained, it is crucial that Congress make its priorities clear, and back them up with adequate financial resources.

In closing, I want to compliment your efforts to date on behalf of the Chesapeake Bay and to express my appreciation on behalf of Pennsylvania citizens. I look forward to your continued support.

Thank you for this opportunity to share my views with you today.

#

TESTIMONY OF JOHN ATKIN, CLEAN WATER JOBS COALITION, NORWALK, CONNECTICUT

My name is John Atkin and I am speaking on behalf of the Clean Water/Jobs Coalition which originated in the Long Island Sound watershed area. I will share my experience as a former member of the Connecticut House of Representatives and State Senate for ten years, as founder and chair of the Bi-State Long Island Sound Committee, as one of the founding members of the Clean Water/Jobs coalition, and as person actively involved in Long Island Sound through the Soundkeeper Fund, the National Audubon Society, and other organizations.

I grew up in Norwalk, Connecticut, one of the 98 cities and towns including the boroughs of Queens and the Bronx, that border the Sound. Today, as when I was a youngster, I swim in of New York. Inc. the Sound. I have taught aboard a research vessel on the Sound, about the Sound, to youngsters and adults alike about the 450 species of marine life that inhabit the Sound. I have told my students that the Sound has 577 miles of shoreline, is 110 miles long, and 21 miles wide at its widest point. And I have informed them that 10% of the country's population live within 50 miles of the Sound.

That startling statistic is precisely why the estuary is stressed. Over one billion gallons of inadequately treated sewage pours into the Sound from 44 sewage treatment plants every day. Land development over the last 200 years has filled in nearly 75% of the coastal wetlands that acted as a natural buffer and filter for the runoff into the Sound. Additionally, the construction of roads and parking lots near the Sound speed up the process of oil, salt, trash and animal waste finding its way into the Sound.

The Sound is bordered by two states, and is serviced by two regions of the Environmental Protection Agency (EPA). Connecticut is in Region I, with its office in Boston, and New York State is in Region II with its office in New York City. Senator Lieberman's "Long Island Sound Improvement Act of 1990," was an important step in recognizing the Sound as nationally significant with its own EPA office after models set forth for the Chesapeake Bay and the Great Lakes. This, along with ongoing work of the Long Island Sound Study under the National Estuary Program, the creation of the Bi State Long Island Sound Committee and the citizen alliances and coalitions that have formed are further evidence of Long Island Sound being a priority water-body for the nation.

I stood on the shores of the Sound on Calf Pasture Beach in Norwalk nearly six years ago and called on my colleagues from the States of Connecticut and New York to join together on a formal and regular basis to examine what each state was doing in handling the problems of the Sound, and how the two states could work together. This effort was designed to compliment the programs initiated under the National Estuary Program. I negotiated with the Governor's offices from the two states to ensure Executive Branch involvement in the process. Identical legislation was introduced in both states to form a Bi-State Committee, and after passage, and the signatures of both Governors, the first meeting was held in Stamford, Connecticut. Governor William O'Neil of Connecticut attended and enthusiastically called for renewed action and cooperation between the states, and Governor Mario Cuomo of New York, through a spokesperson, did the same. Since that day, the state's environmental agencies, and legislative representatives have been working closely together to further ensure that the issues dealing with Long Island Sound are addressed equitably on both sides of the state line.

Today, public concern for the Sound continues to be high and major policy decisions are being discussed. In addition to the reauthorization of the Clean Water Act, the draft of the Comprehensive Conservation Management Plan (CCMP) for the Sound under the National Estuary Program has been completed and the public has had an opportunity to comment. Although many of us felt that the Plan fell short of expectations, and are disappointed in the lack of technical discussion, we still realize that without it, and without the National Estuary Program there would be little cooperation among the states. For example, the "no net increase" of nitrogen plan that was adopted by Connecticut and New York probably never would have occurred without it.

The Management Conference of the Sound's estuary program consisted of government agencies, academics, elected officials and citizen representatives. They worked to complete the plan with sections on hypoxia, toxins, pathogens, floatables and living marine resources. The Citizen Advisory Committee of the Sound study was an active participant in the process, and was an integral partner in the development in the final plan.

We need the leadership of this committee to ensure that the federal government remains an active player and financial supporter in the effort to restore our Sound. Specifically, it is essential that the federal government remain a partner in assisting states and municipalities in upgrading adequate sewage treatment facilities in the Sound's watershed. In the Sound, hypoxia is responsible for the lack of life in many parts of the estuary. Only through a federal, state and local partnership can the billions of dollars needed be found.

The continuation of funds in the Long Island Sound estuary to further assist in the establishment of state revolving loan funds must continue. Many Connecticut cities have been hard hit by the recession and massive deficits. In fact, Bridgeport, Connecticut even filed for bankruptcy a couple of years ago to demonstrate the severity of the situation in their city. Federal monies must be tied to priority infrastructure needs identified in the CCMP of the Long Island Sound study under the National Estuary Program. In addition, municipalities are beginning to address growth management issues to ensure new facilities remain in capacity. Long Island Sound is an estuary of national significance, and Congress should play a role in financially supporting long term restoration of the ecosystem.

Finally, I'd like to talk a little bit about Senator Lieberman's bill, S. 815, the Water Pollution Control and Estuary Restoration Act, co-sponsored by Senators Moynihan, Dodd and D'Amato. In the House, Representatives Rosa DeLauro and Nita Lowey have introduced companion legislation (H.R. 1720) with over 60 co-sponsors. I have attached for the record a list of over 100 organizations from the Northeastern United States in support of S. 815, including environmental groups and union and building trade organizations. The reason so much support and leadership within this list has come from the Long Island Sound region, is that without S. 815 becoming part of the Clean Water Act re-authorization, our efforts and plans to clean up the Sound will falter. We need strong federal support to the National Estuary Program for implementation of the CCMP, for continued coordination between state and federal agencies and for the funding levels of S. 815 to bring the SRF program to a level of \$5 billion annually, with special set asides for critical, nationally recognized estuaries like Long Island Sound.

While we are gaining support from organizations everyday from other parts of the country for S. 815, the unique birth of the Clean Water/Jobs Coalition began on Long Island Sound. The coalition began on a confrontational note in the winter of 1992, when, as the Long Island Sound Watershed Alliance was meeting in New York, 1200 union picketers stood outside and expressed concern about their economic survival. As representatives from both sides met, they started talking about cleaning up the Sound, and creating jobs in the process. They also spoke of helping economies that rely on clean water like commercial and recreational fishing, recreation and tourism; and trying to work for development away from sensitive environmental areas while providing the infrastructure to support it. But most important, the theme that truly brought the groups together was that the federal government must pay an equitable share of the clean-up costs. Local, state and federal governments must pay a part of the sewage treatment investment with the federal government taking a leadership role. A Long Island Sound plan which places the entire fiscal burden on implementation on the most vulnerable level of government is destined for environmental and economic failure.

The Clean Water/Jobs platform that developed after this "fortunate" confrontation expanded beyond the Sound, and S. 815 became the coalition's legislative vehicle. Now we have begun to enlist support from environmental leaders,

contractors and unions from around the nation. An overriding emphasis was placed on the National Estuary Program sites and the Great Lakes, whose regions are developing comprehensive management plans for restoration. The platform developed into not just an environmental plan, but a jobs program. A program that according to several studies can result in up to 57,000 jobs for every billion dollars invested. The studies included direct jobs for construction and repair of sewage treatment plant facilities along with indirect jobs by enhancing clean water related economies.

In this country, our clean water infrastructure is just as important as transportation infrastructure which the federal government has been investing approximately \$155 billion over a six year period. Financial support, with an emphasis on innovative approaches, is another exciting aspect of our Clean Water/Jobs coalition and in turn S. 815. It expands the traditional view by showing that funds for non-point source pollution control and wetland restoration can also provide jobs to the region's economy. The Sound Study's CCMP goal is integration of point and non-point pollution sources in a management plan which can maximize environmental and, in turn, economic benefit. Best management practices and new infrastructure ap-

proaches are some examples of innovation for our clean water future, and will need to receive strong federal support.

The coalition of organizations that support this legislation may seem highly unusual at first glance, but it shows what can be accomplished when people communicate and listen to one another. The old adage of jobs vs. the environment, is being replaced. Now environmentalists and the construction industry realize that by working together, jobs, sustainable development and a clean environment are a reality. The support that has formed around Long Island Sound has put the Sound on par with the recognition of other ecosystems such as the Chesapeake Bay and the Great Lakes.

Long Island Sound represents an ecological system with some of the greatest urban population pressures in the nation. A clean Sound makes environmental and economic sense because it can pave the way to solving some of the complex problems facing estuaries around the nation. We in the coalition are proud of the Long Island Sound region's leadership role in bringing together jobs and the environment nationally. We can only hope that S. 815 will become part of the committee's Clean Water Act reauthorization proposal.

I thank you for the opportunity to testify today and I would be pleased to work with this committee and its staff if I can be of assistance.

TESTIMONY OF

PAUL W. HANSEN

DIRECTOR, MIDWEST OFFICE, IZAAK WALTON LEAGUE OF AMERICA

**PERTAINING TO: THE CLEAN WATER ACT AND THE MISSISSIPPI RIVER
BEFORE THE SUBCOMMITTEE ON CLEAN WATER, FISHERIES AND WILDLIFE
UNITED STATES SENATE, WASHINGTON, D.C.**

AUGUST 4, 1993

National Office: 1401 Wilson Boulevard Level B

Arlington, Virginia 22209-2318 Phone (703) 528-1818

Midwest Office: 5701 Normandale Road Suite 210

Minneapolis, Minnesota 55424 Phone (612) 922-1608

Printed on Recycled Paper

Mr. Chairman, Honorable members of the committee, I am Paul W. Hansen, director of the Midwest Office of the Izaak Walton League of America (League). As you may know, the League has been deeply involved in Mississippi River conservation issues since 1924, when League-sponsored legislation that established the Upper Mississippi National Wildlife and Fish Refuge was passed by Congress. The pen that President Coolidge used to sign that bill is displayed in my office today.

The Father of Waters

The Mississippi River is the dominant watershed of the North American continent, and the second largest drainage basin in the world. The mighty Mississippi:

- stretches 2,358 miles from Minnesota to the Gulf of Mexico;
- borders 10 states;
- drains an area that covers more than a million square miles, including all or parts of 33 states and 2 Canadian provinces;
- provides the major source of inflow into the Gulf of Mexico.

The Upper Mississippi River System includes nearly 1,300 miles of commercially navigable portions of the Upper River north of Cairo, Illinois. The Upper Mississippi has been officially recognized by the Water Resources Development Act (WRDA) of 1986 as both a nationally significant ecosystem and transportation system. From the mouth of the Ohio River to the Gulf of Mexico, the Lower Mississippi stretches almost 1,100 miles.

The Mississippi's Resources

The Mississippi River is considered one of North America's greatest environmental resources, with its channels, river lakes, backwater ponds, sloughs, wetlands, bottomland hardwood forests and adjacent valley lands.

The Mississippi River is home to a vast inventory of fish and wildlife:

- 241 species of fish, including representatives of some of the most ancient lineages of freshwater fishes (gars, sturgeons and paddlefish) and estuarine species that regularly enter the river's lower reaches;
- the river's corridor is a major flyway for neotropical migratory birds and is used by up to 40 percent of North America's waterfowl and wading birds;
- the Upper Mississippi National Wildlife and Fish Refuge, which runs from Wabasha, Minnesota, to Rock Island, Illinois, is home to 270 bird species during all or part of the year;
- 50 mammal species live on and along the river;

- original forested wetlands associated with the River covered about 21 million acres -- less than 5 million remain.

High public demands for use of the River's natural resources are burgeoning in many areas, especially near larger towns and metropolitan areas. For example, the Upper Mississippi River National Wildlife refuge reports 3.5 million visits annually -- more than the visits to Yellowstone National Park. The Upper Mississippi alone generates revenue from recreational and associated uses that exceeds \$1 billion annually. Waterfowl hunting in the flyway is valued at \$58 million annually, and sport fishing on the Mississippi is valued at well over \$100 million.

Threats to the River

Despite these values and many others, the Mississippi River is being severely degraded by a combination of human impacts, including:

- point source pollution from industry;
- nonpoint, polluted runoff from farms and cities;
- operation and maintenance of the navigation system;
- movement of tows and recreation craft;
- development along the river and in the watershed;
- destruction of filtering wetlands;
- energy development.

Point source pollution is a serious problem, especially on the Lower River where the states from Arkansas to Louisiana are home to many of the country's most polluting industries. On the Upper Mississippi, polluted runoff from urban areas and agricultural lands are considered a greater problem. This nonpoint, polluted runoff into surface waters and groundwater, is the problem that the Clean Water Act has been least effective in addressing. The most severe problems attributed to polluted runoff in the UMR are excessive loadings of sediments and suspended solids, nutrients, and contamination from toxic materials, including pesticides and heavy metals. Goals for pollutants established by the federal EPA and state governments are not protecting the River. River ecosystems are in serious decline despite the fact that the states are not reporting widespread or persistent exceedances of current numeric water quality standards.

Nutrient enrichment and sedimentation from contaminated runoff is certainly the single largest environmental problem on the river. The river currently contributes unnaturally high levels of nutrients to the warm waters of the Gulf of Mexico -- much of this originates from agricultural sources in the Upper Mississippi basin. This nutrient enrichment is largely to blame for development of large, oxygen-depleted "anoxic" areas, also known as "dead zones" in the Gulf, which are responsible for massive fish kills that threaten the Gulf's \$780 million/year fishery.

The River's political geography is to blame for a big part of its problems. Because it flows between the states, the Mississippi is often neglected. Several coordinating mechanisms exist to help states work together and with the federal government on various Mississippi-related problems. However, these entities generally have limited or no authority to take action on their own. They perform an important role, but have not provided the strong or unified leadership needed to address the River's complex problems.

The Mississippi River is Being Mismanaged

While the floods of 1993 would have been devastating to human development on the historic floodplain under any river management scheme, they have clearly been made worse by the drainage of wetlands, the channelization of the river and the proliferation of levees. The extensive damage caused by these floods serves to highlight the fact that the U.S. Army Corps of Engineers has continued to manage the Mississippi in a manner that sacrifices the multiple purposes of river management -- including flood control, environmental management, and recreation -- to the single purpose of navigation.

Let me give you just one good example, but by no means the only one. In March of this year, without any specific request by Congress to do so, the Corps announced the beginning of a \$33.6 million "feasibility" study on \$4.8 billion in navigation capacity expansion measures identified by the Corps as their "preferred alternative" in their "Upper Mississippi River Navigation Study Reconnaissance Report." This is the most expensive navigation capacity expansion ever considered and would include the addition of 1200-foot locks at up to 16 of the 35 locks and dams on the Mississippi and Illinois River systems. This will be in addition to \$80 to \$90 million per year that the taxpayers already spend on this archaic, environmentally destructive and unreliable means of transport. The Office of Management and Budget described waterway transport as the most heavily subsidized mode of transporting goods; it is also the most unreliable. It is closed most of the winter, is closed during floods and is closed on a regular basis by accidents at the locks.

The supposed advantages of waterway transport have been vastly overstated by the barge lobby, as was documented in a recent study by the University of Iowa's Public Policy Center, Transportation and Iowa's Economic Future. This study points out that: "It is significant that even with a major subsidy, the cost of shipping grain from Iowa elevators to New Orleans is only marginally cheaper by barge than by rail." The only real effect of the massive subsidy is that it keeps shipping prices about 10 cents a bushel lower for farmers who live within about 100 miles of a waterway. No one has explained why the taxpayer should provide these farmers with this extra subsidy, but the University of Iowa study suggests

that if the purpose is to provide cheap transportation for these farmers, "direct support subsidies to farmers are likely to be more cost effective than massive public expenditures on locks and dams."

The study concludes:

-- "It is not prudent to make costly investments when great uncertainty enshrouds the forecast that govern the economic feasibility of these investments."

-- "In the case of large-scale capacity enhancements of locks and dams on the Mississippi River, the large costs and uncertain demand argue against advocating these investments at present."

The study also points out that "none of the locks and dams had traffic volume in 1987 even approaching its capacity," and that "additional demand that does develop can be met by peak pricing or railroads." In other words, the project is not needed.

Require a National Academy of Sciences Study of the Management of the Upper Mississippi

I am here today, not to tell you that I have all the answers to the management questions raised by the flood waters, but to tell you that we need answers to these questions before we embark on the enormous federal spending that will be required to restore the Mississippi in the aftermath of the flood and the even greater long-term spending that the Corps proposes for navigation expansion. I am here with one simple suggestion and request, that you require in the Clean Water Act that the Corps divert a significant portion of their \$33.6 million navigation "feasibility" study to contract an independent analysis of the management of the Mississippi with the National Academy of Sciences. This report can then be used by Congress and the President to determine the most cost-effective means of managing the Mississippi in the future -- for flood control, for the environment, and for navigation. Such a comprehensive and independent study could be completed for a fraction of the \$33.6 million now being spent by the Corps on "feasibility" studies for the single purpose of a major navigation capacity expansion -- a project that is deemed "unwise" and "not justifiable" by the only independent and academic analysis that it has been given (by the University of Iowa Public Policy Center).

We believe that the Mississippi River is being seriously mismanaged by the U.S. Army Corps of Engineers and that an independent review of the river's management is essential before massive expenditures are made.

IWLA Recommendations for Changes in the Clean Water Act That Would Benefit the Mississippi River

The League is involved with a number of efforts to protect the Mississippi River. The changes that we think would do most to benefit the Mississippi River include:

* **Providing a special designation for the Mississippi River.**

In previous revisions of the Clean Water Act, Congress has provided special designation for the nation's largest lake system and the nation's largest estuary. Special status for the Great Lakes and the Chesapeake Bay have vastly improved the management of these water bodies. It is time to extend this to the nation's largest river system.

* **Encouraging a watershed-based approach to protection and restoration of waterbodies.**

To be successful, efforts to protect and restore the Mississippi and most other waterbodies must be based on watershed strategies that account for land uses in the watershed and their downstream impacts. Water quality protection efforts in this country are moving in this direction, and changes are needed in the CWA and its programs to reinforce this approach.

* **Dealing more effectively with polluted runoff.**

Current totally voluntary approaches to nonpoint source problems are simply not working in the Mississippi basin. The country needs to lean more toward limited regulations that will provide the enforcement tools necessary to back up other approaches. Possible watershed-based models for dealing with polluted runoff more effectively are the new Coastal Zone Act Reauthorization Amendments (CZARA) to the Coastal Zone Management Act (CZMA), which attempt to encourage coastal states to take a more active approach to addressing nonpoint source threats, and the proposed Oberstar polluted runoff bill, H.R. 2543.

* **Strengthening wetland protection.**

The 404 wetlands sections of the current Clean Water Act must be revised or completely restructured to provide increased protection to wetlands, including taking cumulative losses into account.

* **Fostering citizen participation.**

A certain amount of Section 319 Nonpoint funds should be allocated to fund volunteer water monitoring programs that build citizen awareness, knowledge and support for their waterways. In addition, an urban watershed restoration project is needed to assist citizens groups in urban areas where low-income and ethnic minorities often use dangerously polluted sections of the River and its tributaries for subsistence fishing and other purposes.

* **Improving procedures for setting standards.**

Standards should incorporate meaningful biocriteria that indicate the health of ecosystems much more effectively than numeric standards. In addition, better coordination of monitoring

and standard setting is needed that considers cumulative impacts and overlapping permitting by multiple jurisdictions.

* **Strengthening enforcement of current Clean Water Act provisions.**

Enforcement of the Clean Water Act should be strengthened by establishing mandatory minimum penalties for serious violations, based on current U.S. EPA and New Jersey Clean Water Enforcement Act definitions that reduce economic gains enjoyed by violators. In addition, discharge reporting and inspections should be increased, and current obstacles to citizens suits removed.

* **Restoring aquatic ecosystems.**

The National Research Council's report Restoration of Aquatic Ecosystems (National Academy Press, Washington, DC, 1992) should form the basis for the design of a national aquatic ecosystem restoration strategy. Aquatic ecosystem restoration projects should be designed to sustain and enhance the diversity of native species and ecological communities on a regional scale.

Let us make the suffering from the floods of 1993 the springboard for a new era of improved management of the Mississippi. We appreciate your consideration of our recommendations.

TESTIMONY OF MARCY KAPTUR, A REPRESENTATIVE IN CONGRESS FROM
THE STATE OF OHIO

Thank you, Mr. Chairman, Senator Metzenbaum, and members of the Subcommittee, for the opportunity to testify before the Subcommittee today. The Clean Water Act is a critical piece of legislation for the Great Lakes region. Twenty years ago, when the Clean Water Act was first enacted, Lake Erie's condition was so bad that it was given up for dead. The Clean Water Act with its sewage treatment standards and grants, and water quality standards and permit requirements effectively resuscitated this irreplaceable resource. But Lake Erie, as the rest of our nation's large fresh water bodies, is still far from healthy and self-sustaining. We have not met the goal of "fishable and swimmable" waters in many areas. More work needs to be done.

In addition, we have learned much along the way about environmental protection, and what works and what does not work. That is why I am particularly pleased that we will be working on reauthorizing the Clean Water Act in this Congress. From my position on the House subcommittee that determines the appropriations for the Environmental Protection Agency (EPA), I am aware of how limited our resources are for tackling this huge problem. However, we cannot afford to have anything less than the most up-to-date and effective water quality protection in our country.

Today, I would like to provide my comments on the Metzenbaum-Glenn Great Lakes Clean Water Amendment which I wholeheartedly endorse. I would like to do so by discussing specific issues, drawing on some examples of clean water needs in my district.

The Great Lakes comprise the world's largest fresh water system, and contain 95% of this nation's fresh surface water. That's a big resource and a big responsibility. The Great Lakes are also fragile. They sustain extensive use by manufacturers, the maritime industry and recreational users. The Great Lakes are the repository for water that runs-off a huge area of land; the basin as a whole is roughly the size of the former West Germany. In addition, the Great Lakes system has an exceedingly slow flush rate. That is, it takes centuries for water to move from Lake Superior through the system to the St. Lawrence River and ultimately to the Atlantic Ocean. The flushing rate of Lake Superior alone is some 200 years. Lake Michigan's retention time is 100 years. Lakes Erie's rate is shorter because it is so shallow, at 3 years.

The special features of the Great Lakes create special water quality protection needs within the basin. However, some of our most pressing concerns are shared by the nation, namely, sewage treatment, toxic discharge reduction, and nonpoint source pollution control. I would like to begin by emphasizing our stake in these national policy concerns but I will focus my remarks on the more specific Great Lakes needs addressed in the Great Lakes Clean Water Amendments Act, especially contaminated sediments and pollution prevention. I also would like to stress my concern over the North American Free Trade Agreement (NAFTA).

CONTAMINATED SEDIMENTS IN THE GREAT LAKES

As for the rest of our nation's fresh waters, the EPA estimates that a full 75% of the new loadings of certain contaminants into the Great Lakes is from diffuse sources of pollution. These sources include, broadly speaking, atmospheric deposition of toxic substances, leachate from contaminated sites and runoff. Fortunately, a provision in the 1990 Clean Air Act, entitled the Great Waters program, will go a long way toward identifying impact of and abatement needs for atmospheric deposition of toxicants of the Great Lakes. However, leachate of contaminants from 'pollute' sites and runoff fall very much under the jurisdiction of the Clean Water Act, and in both cases, more needs to be done.

Contaminated sediments and other in-place pollutants are gaining increasing attention as sources of contaminants into the Great Lakes. Contaminated sediments are one of the largest pollutants the western basin of Lake Erie. They introduce contaminants into the food chain that accumulate to dangerous levels in fish and of wildlife. These polluted sites impede harbor uses and redevelopment of old industrial sites. In short, the sooner we get a handle on cleaning these areas up, or effectively containing the contaminants the better. We are already overdue in our efforts to take care this public health, environmental and economic problem.

The Great Lakes Clean Water Amendments Act provides a comprehensive program for addressing the special problems within the Great Lakes basin created by contaminated sediments. Sediment clean-up, prevention and improvement in our day-to-day management practices are all part of the solution to this huge environmental problem each is significantly improved by the Great Lakes measure.

I strongly endorse the provision within the Great Lakes Clean Water Amendments which reauthorizes and updates the Assessment and Remediation of Contaminated Sediments Program (ARCS). It is companion language to my colleague Eric Fingerhut's legislation introduced on June 30th. As you know, the program demonstrates sediment remediation technologies on the pilot scales at 5 Areas Concern. In Ohio, this program has been demonstrated at the Ashtabula Area of Concern. The second phase will authorize more sediment treatment technology demonstrations at the pilot and full scale. It will also include technical assistance and outreach to communities beset with contaminated harbors around the basin. Perhaps it should be further expanded to include a jobs program could be conducted in cooperation with the region's universities assist students in entering the field of pollution remediation.

Agricultural run-off is the number one water quality problem in northwest Ohio. Conservation tillage has gained acceptance in part due to the federal cost share funds (Section 319 non-point source pollution grants) that were made available for the purchase of conservation tillage equipment, and due to profitability of no-till farming. The program has worked extremely well in my district. Water quality testing has shown some reduction in phosphorus levels but the sediment, nitrate, and pesticide loads remain high. *To achieve these necessary reductions, additional incentives are needed to encourage the agricultural community to practice conservation tillage, and reduce its use of fertilizers and pesticides.* Stream bank buffers, windbreaks, cover crops, wetlands, and practices such as crop rotations that result in reduced chemical applications improve our environment. The federal government must continue to help the states and regional agencies solve these problems.

I would like to express my strong support for the Great Lakes Sediment Reduction provision of S. 1183, authored by Senator John Glenn. This measure was included in last year's Water Resources Development Act. but dropped from the final version. The measure requires the Corps of Engineers to work through the EPA to develop Tributary Transport Models of soil run-off for each major river system feeding a Great Lakes harbor. The task of developing models is not as monumental as it may sound since the Corps, the Soil Conservation Service and the United States Geological Survey already have substantial data on some rivers. However, a further development and compilation of this is exactly what the Great Lakes basin needs to identify high priority watersheds for intensive nonpoint pollution abatement work. We also need this information for our Lakewide Management planning process. Bedload material from rivers is a major transport medium for pollutants entering the Lakes, yet currently it is not accounted for in our lakewide mass balance efforts. The grants provision contained in this section promises to save federal dollars through reducing the loadings of sediments that require dredging each year in the Great Lakes Basin. We spend over \$33 million annually on dredging. Prevention will save money and improve water quality.

POLLUTION PREVENTION

Senators Metzbaum and Glenn included language in their Great Lakes Clean Water Amendments Act which would provide technical assistance and incentives to industry and municipalities in the Great Lakes region to implement pollution prevention and source reduction practices. Mr. Chairman, I like this language so much that I will be introducing similar legislation in the House this week.

Pollution prevention is often the most efficient way for industry and municipalities to achieve the water quality standards that are necessary to protect the Great Lakes but the up-front investment and technical uncertainties can create difficult initial barriers. The Great Lakes Pollution Prevention for Industries language serves the dual purpose of helping to demonstrate modernizing environmental technologies and practices, and to increase the extent to which pollution prevention practices become part of the Best Available Technologies found on factory floors.

The Pollution Prevention for Cities program, authored by Senator Glenn, provides technical and financial assistance to communities seeking the most cost-efficient and environmentally effective ways of cutting pollution in run-off, wastewater and stormwater. Both programs are especially important to the Great Lakes because our regulated community will soon be going the extra mile of environmental protection in compliance with the Great Lakes Water Quality Guidance.

Mr. Chairman, while sediment contamination and pollution prevention are two areas of special concern to me and my district, I reiterate my full support for all the provisions of the Great Lakes Clean Water Amendments Act. I look forward to working with you and your Committee to gain enactment of this important measure.

Mr. Chairman, I also endorse the Great Lakes Clean Water Amendments provision clarifying the relationship between the Corps of Engineers and the EPA in day-

to-day dredge spoil management activities in the Great Lakes basin. Sediment management is not a simple matter, and there are legitimate differences of opinion among agencies of the federal government, and between federal and state agencies, over the best way to carry it forth. However, without a clear line of authority between agencies over decisions with respect to environmental acceptability of dredge spoil management practices, real problems can result.

The worst example was in my own home Port of Toledo. A disagreement between the Corps of Engineers and the EPA-endorsed State EPA position nearly shut down the port. Through a team effort on the part of Senators Glenn and Metzenbaum, the Governors Office, and myself, we now have a constructive process of sediment management planning and interagency coordination in our watershed. The Great Lakes Clean Water Amendments will prevent future disputes, and hasten the same constructive approach in other watersheds.

NAFTA-RELATED CONCERNS

North American Free Trade Agreement (NAFTA)—related discussions, budget initiatives, and legislative proposals related to the environment have focused primarily on southern border initiatives, that is U.S./Mexico. The Fiscal Year 1993 appropriations for the Environmental Protection Agency (EPA), for example, provided over \$200 M to address U.S./Mexico border environmental and infrastructure needs in preparation of NAFTA. The Fiscal Year 1994 proposal included \$161 M in EPA funding to help the South prepare for NAFTA. All of these monies would be obtained from general revenues.

A House proposal by Representatives Wyden and Richardson would create an additional Border Environmental Fund (BEF) and provide bonding authority to a North American Commission on the Environment. This Fund is proposed for clean-up of existing contaminated sites, construction of new environmental infrastructure, and adoption of pollution prevention practices exclusively on the U.S./Mexico border. A Richardson-only proposal would create a guaranty fund also restricted to southern border needs.

In fact, it is incorrect to assume there is only a southern-border need to prepare for NAFTA. The northern border—U.S./Canada—has profound environmental needs associated with free trade, deriving in large part from the region's need to adapt its economic base. In particular, the region will need to accomplish clean-up of its lakes and toxic hot spots, harbors and old industrial areas to promote necessary economic diversifications; and it will need to retrofit its aging manufacturing facilities with pollution prevention technologies and practices to remain competitive in a free trade environment given the relatively stringent environmental standards of the Northeast and Midwest region of our country.

Moreover, northern border communities often face these needs—along with worker retraining, and transportation infrastructure development—in a context of diminishing wealth, as a consequence of industrial relocation to the south. The region faces diminishing political resources as population also moves southward. In contrast, southern border localities will address their needs in the context of increased economic activity and political clout within their region.

A 1988 EPA survey estimated that the eight Great Lakes states would need to invest an additional \$27 billion by the year 2008 for municipal wastewater treatment improvements; these states must complete more than 700 projects to ensure that municipalities meet at least secondary treatment standards.

In addition, 42 Areas of Concern have been identified in the Great Lakes basin which have large concentrations of toxic pollutants. Effects of toxic pollution that have been measured in the Great Lakes include health risks to humans along with deformities, tumors, and reproductive disorders in all types of wildlife.

Budget initiatives drawn from general revenues convert a proposed trade agreement into an "aid agreement"; they provide direct aid to the U.S./Mexico border, and indirect aid to the polluters who are responsible for the contamination that these monies will rectify. Such initiatives do not reflect the "polluter pays" system that applies to the rest of the nation as it copes with sewage treatment infrastructure needs and clean-ups of contaminated sites.

NAFTA-related commissions and mitigation funds should be "border-blind" if they are truly intended to facilitate free trade; and expenditures should be based on technical trade related criteria rather than broad untested assumptions about geographic need.

The attached information indicates the overall funding requested by the Clinton Administration for environmental initiatives associated with the NAFTA in FY 1994. As indicated, \$150 million is requested for construction grants for wastewater and drinking water projects within EPA's budget. This funding is all in the form of

grants as opposed to loans. As you know, the regular funding that is appropriated to States through the State Revolving Loan Fund is in the form of loans, and a 20% match by the States is also required.

As you know, \$70 M was requested in the FY 1994 EPA budget for construction of the Tijuana wastewater treatment plant which will be located in the United States but treats Tijuana sewage. The authorization for appropriations for the plant was included under Section 510 of the Clean Water Act of 1987. The FY 1993 VA, HUD and Independent Agencies Appropriations bill capped the amount that could be appropriated for the plant at \$239.4 million—the current estimated EPA responsibility. \$124.2 M has been appropriated through FY 1993. The House FY 1994 VA, HUD and Independent Agencies Appropriations bill includes \$35 million for this project.

The House VA, HUD and Independent Agencies Appropriations bill has set aside \$500 million in non-earmarked funds which cannot be spent until March 31, 1994. These funds are intended to be used for wastewater treatment needs for hardship communities. Eligible projects must be authorized by the Public Works and Transportation Committee prior to March 31, 1994 to qualify for the funds. Projects that were requested by President Clinton and not funded include \$50 million for a grant to Texas for colonies projects; \$10 million for a grant to New Mexico for colonias projects; and \$20 million for architectural and engineering activities in Nogales, New Mexico and Mexicali, Mexico. The \$50 million and \$10 million require a one to one state match by Texas and New Mexico. The match for the \$20 million will be based on an agreement between the International Boundary Water Commission (IBWC) and the States that have the border projects. Therefore, there is not specific designation in the EPA budget for cost sharing for the \$20 million. This funding would all be in the form of grants.

Most recently, to address the need that all EPA projects must be authorized in order to receive access to the \$500 million account, House Agriculture Committee Chairman Kika de la Garza introduced legislation to authorize EPA funding for the construction of water and wastewater projects serving communities, including colonias, along the U.S. Mexican border. H.R. 2545 would authorize EPA to make available wastewater construction grants to the colonias and H.R. 2546 would authorize EPA, acting through the State Department, to provide financial assistance for joint U.S.-Mexico projects to construct or improve wastewater treatment facilities.

In addition, the Agriculture Appropriations conference also addressed Clean Water related issues with the funding for Rural Water and Waste Disposal loans and grants. These programs help low income rural communities meet federal and state mandated service standards including the Clean Water Act. The Conference Report will include approximately \$500 million for rural water and waste disposal grants, with \$25 million earmarked for the colonias on the U.S./Mexico border.

I would like to urge you to keep in mind the needs of the northern border in any of your action on the Clean Water Act or separate pieces of legislation addressing wastewater treatment needs. I do not argue with the fact that pollution along the U.S./Mexican border is horrendous. However, I believe that all areas of the country should be treated equitably.

As you move to reauthorize the Clean Water Act, I hope that you will consider initiatives that will benefit the Great Lakes region. I look forward to working together in this endeavor.

Thank you, Mr. Chairman, for consideration of my testimony.

TESTIMONY OF ERIC FINGERHUT, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Mr. Chairman, thank you for the opportunity to testify before the Subcommittee today as its distinguished members consider reauthorization of the Clean Water Act. I am here today as a strong advocate of federal programs to protect and enhance our Great Lakes resources to the benefit of the environment and the economy. In fact it was the history of pollution in the Great Lakes, highlighted by the much publicized "death" of Lake Erie and the Cuyahoga River catching fire, that strengthen the resolve of Congress to craft and pass the first Clean Water Act in 1972. The results were dramatic. The removal of conventional pollutants such as phosphorous and untreated wastewater effluent brought Lake Erie back from the dead and breathed life into our economy. The Great Lakes now supports a \$4.5 Billion annual sportfishing economy and Lake Erie stands as the first example of environmental controls reclaiming a large natural resource.

Overall Lake Erie alone boasts a recreational economy that generates \$8.5 Billion annually and supports an estimated 152,000 jobs. If approached wisely, federal in-

vestment to clean up and protect the Great Lakes will sustain economic opportunities for generations to come. Unfortunately, the easy work is behind us.

Historical pollution found in the sediments of Great Lakes rivers and harbors remains a severe impediment to our shipping and recreational opportunities, threatening fish and wildlife resources and placing human health at risk. Federal, state and local work throughout the Great Lakes Basin during the last two decades has demonstrated unprecedented leadership for scientific understanding of natural resources, positioning the Great Lakes as an "environmental laboratory" in which to implement an ecosystem approach to resource management as mandated by our Great Lakes Water Quality Agreement with Canada.

It is appropriate that today, as this committee considers the merits of a regional approach to environmental management, that we reflect on the sustained leadership that the EPA and other agencies have shown within the Great Lakes Basin. Federal interagency work within the Great Lakes represents the most comprehensive, multi-media environmental effort within the United States. However, much has been learned since the 1987 Amendments to the Clean Water Act that formally established the EPA's Great Lakes National Program Office.

I am honored to work with the distinguished Senator from Ohio, Howard Metzenbaum, to craft amendments to the Clean Water Act that will refine valuable lessons learned over recent years and refine them to provide resources and direction to the EPA to assure that past program investment and our vision for the future of the Great Lakes are joined in an enhanced initiative.

Mr. Chairman, as you know, Senator Metzenbaum has joined with other Great Lakes Senators to introduce S. 1183, a package of Great Lakes amendments for the Committee's consideration. On the House side I have worked with other Great Lakes members, including Congresswoman Kaptur, to introduce a number of bills that we will present as a comprehensive Great Lakes package to Chairman Mineta of the House Public Works Committee this Friday. I would like to speak of two bills of special interest.

The "Great Lakes National Program Act" seeks to augment efforts in the Environmental Protection Agency's Great Lakes National Program Office by reauthorizing EPA's Assessment and Remediation of Contaminated Sediments (ARCS) program. The program was originally authorized in the 1987 amendments to the Clean Water Act for five years to demonstrate innovative technologies for the removal of contaminated sediments in Great Lakes rivers and harbors. These "pilot scale" efforts were successful and now require demonstration at the "full scale" to ensure their effectiveness in large scale sediment removal actions.

Additional provisions in the Great Lakes National Program Act direct the EPA to conduct assessments of contaminated sediments at all U.S. Areas of Concern identified by the International Joint Commission and to recommend remediation technologies at each site in a report to Congress. Deadlines for the development of Lake Wide Management Plans are also included in the bill.

The second bill is entitled the "Great Lakes Federal Effectiveness Act." Its purpose is to provide for a higher level of coordination among federal research efforts to avoid duplication and ensure the most effective product with the limited research dollars available.

The bill will establish a Great Lakes Research Council comprised Of the top federal research managers in the Basin. They will be charged with producing an assessment Of current research knowledge to identify our research shortfall from meeting the goals of the U.S.-Canadian Great Lakes Water Quality Agreement and reporting the goals to Congress. This information will provide the basis for a prioritization of research efforts by identifying both long and short-term research goals. The development of a uniform, multi-media, data collection protocol for adoption across the Great Lakes Basin will also be advanced.

Mr. Chairman, the modest federal investment to continue these important programs with additional authorities will help continue the reclamation of our Great Lakes environment, protect human health and insure that the economic underpinning of our region's economy, the Great Lakes, will continue to sustain our livelihood well into the future. Thank you.

STATEMENT OF SONNY CALLAHAN, A REPRESENTATIVE IN CONGRESS
FROM THE STATE OF ALABAMA

Mr. Chairman, I appreciate having the opportunity to testify today in support of H.R. 1899, the Gulf of Mexico Economic and Environmental Protection Act of 1993, that I introduced with my colleague, Greg Laughlin, and others. We would prefer

that the measure move as a free-standing bill, but if that is not possible, we would urge the committee to consider incorporating it into the Clean Water Act Reauthorization.

The Gulf produces approximately 40% of the U.S. commercial fish yield and provides critical habitat for 75% of the migratory waterfowl traversing the country. Gulf ports handle 45% of U.S. import-export shipping tonnage and offshore drilling there accounts for 90% of U.S. production. Recreational opportunities abound and tourism in the Gulf States contributes significantly to their economies.

Two-thirds of the contiguous United States drains into the Gulf of Mexico so it is under some stress. Many shellfish-growing areas have been closed in recent years because of health-related concerns. While warning signs have been sounded in recent years, the government has focused most of its attention on the Great Lakes and the Chesapeake Bay. Those bodies of water are certainly important to the nation, but the Gulf of Mexico is 190 times larger than the Chesapeake and seven times larger than the Great Lakes. Our bill simply formalizes the Gulf of Mexico program to ensure that this highly productive national treasure receives the support it deserves.

The Gulf of Mexico Economic and Environmental Protection Act creates a multi-agency executive board, to be Chaired by the EPA Administrator. Each Gulf State Governor (or designee) will serve on the Board, along with the Chairperson of the Citizens Advisory Committee and a resident of a coastal county from each state. The function of the board will be to develop a comprehensive joint plan for the actions necessary to address economic and environmental problems of the gulf.

The Gulf of Mexico belongs to all Americans, not just those of us fortunate enough to reside on it. It feeds the nation and fills its energy needs. All of us should be appreciative of its contributions and give it the recognition it merits. I am convinced that legislation is necessary to ensure that real progress is made in the Gulf. I will be pleased to work with the subcommittee if it feels H.R. 1899 needs changes, but I do urge you, Mr. Chairman, to move forward with a meaningful Gulf of Mexico bill.

Thank you again for scheduling this hearing on a subject that is of such importance to my district.

STATEMENT OF HON. JEFF BINGAMAN, U.S. SENATOR FROM THE STATE OF NEW MEXICO

Thank you Mr. Chairman for the opportunity to say a few words today about Wastewater Treatment Needs and the Clean Water Act.

First I want to bring to your attention the plight of colonias. Colonias are communities situated along the Southwestern Border of the United States. They are rural residential areas, generally unincorporated, many without paved roads. They are small in size—in New Mexico, they have populations ranging from about 250 to 5,000 people. Residents are generally poor and live in substandard housing with inadequate plumbing and drinking water. Housing lots are extremely small in size and packed together, frequently creating a high density of cesspools and inadequate septic tanks. And the population is growing in size daily, compounding existing problems.

If by chance you happen to visit these colonias, you can only be struck by the primitive conditions in which the residents live. You can only walk away in disbelief that over 350,000 American citizens and legal permanent residents are subject to what most of us would call third world living conditions.

These conditions create health and environmental problems. Many colonias are situated in areas with a very shallow water table resulting in sewage trickling through the ground and contaminating the groundwater. Since many families rely on wells on their property for their drinking water—wells fed by groundwater, it's not surprising that incidences of infectious diseases in the colonias are higher than the national average. It's also not surprising that the groundwater is contaminating our rivers. The National Environmental Group American Rivers recently identified the Rio Grande as 1993's most endangered river, citing inadequate treatment of sewage waste as one of the prime causes of pollution in the border area.

The needs of the colonias have not gone unnoticed. Last year, Congress appropriated through EPA 60 million dollars to help these communities. These funds were used for grants to build needed wastewater treatment facilities. This year, the administration requested funds or EPA to continue helping the colonias construct wastewater treatment facilities. However, when EPA's budget came up for discus-

sion on the house floor, funds were stricken due to a parliamentary debate as to whether sufficient legal authority existed for EPA to make these grants.

The debate today in congress is not if we should help these colonias, just whether we have the legal authority to do so.

I want to end this debate over legal questions, and place attention on where it rightly belongs—how we can help the colonias and their residents. I have therefore introduced an amendment to the Clean Water Act authorizing EPA to make grants for wastewater treatment in the colonias.

The special needs of these communities must be met.

I also want to bring to your attention today the wastewater treatment needs of other small disadvantaged communities which I believe should be addressed by the Clean Water Act. These are small unincorporated communities with inadequate wastewater systems. These communities are too large to qualify for rural water grants, but are too small to shoulder the high per household hook-up fees or monthly water and sewer service fees that would be necessary if they were to finance wastewater treatment construction through revenue bonds or other financing mechanisms.

The South Valley in New Mexico, a small unincorporated community alongside the Rio Grande, is one such community. Most of its 12,000 residents rely on septic tanks. Their drinking water comes from wells on their property. Heavily concentrated septic tanks, a shallow water table, and tight soils resulting in poorly drained septic tanks are contaminating the ground water. state and local governments have already contributed significant funds to address the problem, but additional funding is needed. If this funding were to come through revenue bonds, residents in the area would have to pay 4 to 6 times as much as other new Mexico residents for monthly water and sewer service.

These citizens cannot afford such rates. The Clean Water Act should be amended to include a special grant program for unincorporated communities such as this.

I think that this nation can be proud of what it has accomplished through the Clean Water Act in protecting and restoring the well-being of our waters. To continue this progress, Mr. Chairman, support amendments to address wastewater needs of colonias and unincorporated communities. Thank you Mr. Chairman for your time.

STATEMENT OF HON. EDWARD KENNEDY, U.S. SENATOR FROM THE COMMONWEALTH OF MASSACHUSETTS

Thank you, Mr. Chairman, for giving me the opportunity to discuss an issue of great importance to Massachusetts and communities across the country struggling to meet the requirements of the Clean Water Act.

The federally-mandated clean-up of Boston Harbor is imposing an extraordinary burden on 2.5 million people in 61 communities in Massachusetts—nearly half the state's population. The issue touches every family and every business in the Greater Boston area.

The overall cost of the clean-up and related construction is \$5.7 billion through the year 1999—one of the largest public works efforts ever undertaken. The national average for water and sewer bills is about \$350 a year. In the Boston area, the average household will pay \$572 for water and sewer bills this year—a 300% increase since 1985. Many households above the average already pay far more. Rates are expected to escalate to over \$1000 for the average household by 1999.

The current burden and these estimated increases are major obstacles to economic recovery. They make it harder for existing businesses to survive, and they discourage new firms from locating in the state. Protests have grown into an organized movement. Residents are burning their water and sewer bills or throwing them into the Harbor in a symbolic recreation of the Boston Tea Party. Towns have voted to withhold their payments to the agency that is overseeing the clean-up. The entire project is threatened if we cannot ease the burden.

To date, federal assistance for this project has been less than 10%, compared to the 55% to 75% in federal aid that many communities received for wastewater treatment construction before the 1987 amendments to the Clean Water Act were enacted.

It is time for the federal government to do more. The reauthorization of the Clean Water Act presents the opportunity to address these urgent needs. It is vital that the Committee bill provide significantly increased federal aid for Boston Harbor, to keep pace with the escalating burden facing households and businesses. In a state where economic troubles are far from over, where even many middle-class families

are on the edge each month, struggling to pay their bills, the escalating cost of the Boston Harbor clean-up should not be forcing them to choose between paying their water and sewer bills and meeting other basic needs for their families.

We are continuing to reassess the scope of the project to make sure that each aspect of it is cost-effective. Legitimate questions have been raised about certain expensive parts of the clean-up that are difficult to justify in terms of their environmental benefit. The Committee has an important role to play in this effort, by not precluding sound adjustments to the project's design, and by not imposing new requirements that cause undue hardship in the future.

The Appropriations Committee has signaled its intent to make funding for Fiscal Year 1994 contingent on specific authorization of the project by March 31, 1994. As you know, the authorization contained in the 1987 amendments has technically expired. Consequently, I urge your help in securing short-term authorization for the ongoing clean-up, to ensure continuity until the full-scale Clean Water Act reauthorization can be enacted. Federal aid in the coming year should not be lost for lack of adequate authority.

I also urge the Committee to renew the federal government's commitment to helping the large numbers of communities across the country that are facing very expensive, court-ordered construction projects under the Clean Water Act and Safe Drinking Water Act. The circumstances for Boston Harbor are especially compelling, but this problem is definitely national in scope. In Massachusetts, many towns and cities outside the Boston Harbor area, such as New Bedford, Fall River and the communities in the South Essex Sewerage District, are struggling to comply with federal mandates. Five billion dollars annually for the State Revolving Fund in the Clean Water Act can be readily used and will ease the burden nationwide. The new revolving loan fund proposed by the President to meet the requirements of the Safe Drinking Water Act will also provide much-needed relief.

Finally, I urge the Committee to resolve a problem in the National Estuary Program that threatens to undermine its success. Section 320 of the Clean Water Act should be amended to make clear that the EPA should remain involved in the National Estuary Program process after communities develop their Comprehensive Conservation and Management Plans.

In Massachusetts, the communities surrounding Buzzards Bay have done an outstanding job in working together to develop a plan for the protection of this sensitive habitat. They have reached agreement on the plan and are ready to begin implementing it. But they are being told that the EPA must drop out of the process altogether, leaving them without the agency's valuable guidance and support to ensure successful implementation of their plan.

This problem has arisen in other states as well and it could seriously impair the benefits of the National Estuary Program. I urge the Committee to clarify the law on this issue, so that the EPA can continue to work closely with these communities.

Once again, Mr. Chairman, I commend you for holding these hearings, and I look forward to working with the Committee to achieve these important environmental goals.

STATEMENT OF HON. JOHN KERRY, U.S. SENATOR FROM THE STATE OF NEBRASKA

Mr. Chairman, thank you for holding this hearing today on the Regional Water Issues pertaining to the Clean Water Act Reauthorization. I appreciate this opportunity to join with Senator Kennedy to briefly address our dire situation in Eastern Massachusetts and to introduce our two Massachusetts witnesses, Lt. Gov. Paul Cellucci and Mr. Douglas B. MacDonald, Executive Director of the Massachusetts Water Resources Authority.

First let me acknowledge the enormous task you and your committee have before you in reauthorizing this important environmental statute. While we are here to relay our concerns about our extremely serious situation with the Boston Harbor project, I want to say up front that I know how important this reauthorization is to hundreds of communities that face similar situations around Massachusetts and across the country and I hope we can work with your committee in the coming weeks to make sure that provisions in your legislation also address concerns of smaller urban and rural communities that need assistance to comply with federal mandates.

But we are here now to talk about our specific emergency in the MWRA Water District. I believe it is in the national interest for the federal government to provide direct assistance for the MWRA. As you know, the project is a massive undertaking

which will provide water and sewer services to 2.5 million people in 81 communities with a total cost, including the combined sewer overflow and capital costs improvements, of over \$5 billion.

At the inception of the Clean Water Act, congress acknowledged the important federal role by providing federal support of between 50% to 90% of the funding for systems on the scale of the Boston Harbor project. However, the Federal Assistance for the MWRA project to date has only been about 8% of the total estimated costs.

Let me finally say that this is not a partisan issue but a bipartisan issue. The Clinton Administration this year, as did the Bush Administration in prior year budgets, included \$100 million to assist in curbing the massive rate increases that those in Eastern Massachusetts have been facing in the past few years. While Senator Kennedy and I would like to see this amount doubled—we introduced legislation this year which would authorize \$1 billion over 5 years—we continue to work with the administration to encourage the congress to include the Clinton Administration's 1994 budget request of \$100 million in the 1994 appropriations bill.

We ask you, Mr. Chairman and members of the committee, to help us secure an authorization for that funding as requested in the President's Budget in order to release to the Boston Harbor Project the funding contained in the House's EPA Appropriations Bill, prior to March 31, 1994, when it will expire.

Thank you for taking time to hear Senator Kennedy and me and for allowing Lt. Gov. Cellucci and Mr. MacDonald an opportunity to address your committee.

TESTIMONY BY AREGO PAUL CELLUCCI, LIEUTENANT GOVERNOR,
COMMONWEALTH OF MASSACHUSETTS

Thank you for the opportunity to testify before you on *Senate 1114, The Water Pollution Prevention and Control Act of 1993*. On behalf of Governor William Weld and the Commonwealth of Massachusetts, I am here today in strong support of this legislation to reauthorize the Federal Clean Water Act (CWA). My comments on the bill will address the critical issue of funding for wastewater treatment projects, and will also highlight some of the innovative and progressive provisions related to pollution prevention and watershed protection.

TITLE I. The price of clean water across the nation is rising dramatically. Massachusetts, with its dense population, is burdened with particularly high costs for water pollution abatement projects. Local communities face costly upgrades of existing water and wastewater facilities or the need for entirely new facilities to serve growing populations. Massachusetts' immediate unmet capital needs for wastewater treatment projects is \$6.6 billion. This includes construction of municipal wastewater treatment plants, major interceptor sewers, wastewater pumping stations, correction of combined sewer overflows, collection sewer systems, and removal of infiltration/inflow from existing sewer systems. More projects and additional needs in these categories are expected in the near future as final planning is completed on ongoing municipal wastewater projects.

Financing wastewater projects in Massachusetts and other states will require both federal and state support. To reverse the unfortunate decline in coastal and inland water quality, and to cushion the impact on ratepayers, federal and state dollars are needed to help fund planning, design and construction/upgrades of treatment plants and pump stations, construction of sewer systems, infiltration/inflow removal, and combined sewer overflow projects.

But Massachusetts is not asking the federal government to solve our water quality problems without a commensurate effort on the state's part. We have optimized the expenditure of all federal assistance received from past CWA authorizations. Just last month we successfully financed 37 environmental abatement projects in 20 communities for \$91.1 million. To support future wastewater infrastructure needs, the Weld Administration's strategy is to support an annual General Fund appropriation of state monies for wastewater treatment projects (\$30 million was appropriated for FY '94); amend the State Revolving Fund (SRF) to include more funds for wastewater projects; and establish an innovative Technologies Program to facilitate permitting/implementation of innovative wastewater treatment technologies to better attain clean water objectives at reduced cost to ratepayers. Specific to the Boston Harbor Project, Governor Weld has convened a rigorous audit of the project, to identify possible cost savings related to project financing, management, administration, scheduling and technology. Governor Weld will press for appropriate cost-saving modifications in the Boston Harbor project where consistent with Clean Water Act requirements.

In order for Massachusetts and other states to meet their obligations in funding wastewater treatment, there is an urgent need for renewed and expanded federal participation in funding these projects. As you know, the federal authorization for new SRF monies has expired and is precipitating a major financial headache for state and local governments.

We support the SRF authorizations in Senate 1114, AS A MINIMUM, and urge you to increase this amount to the highest level possible. Under this bill, SRF capitalization grant funding would be reauthorized at \$2.5 billion annually through Fiscal Year 2000 (total of \$15 billion). Additional amounts each fiscal year, rising to \$2.5 billion in Fiscal Year 2000 (total of \$7.5 billion), would be authorized pending Congress meeting its annual deficit reduction goals. Under the existing federal allocation formula, the SRF capitalization grant of \$2.5 billion would provide Massachusetts with \$79 million per year. When the federal monies are combined with a 20% state match (\$16 million), the resultant capitalization funds of \$95 million would be placed into a reserve which would secure \$190 million in revenue bonds. Using this approach, the original \$79 million in federal grants will generate \$190 million in the construction of critical municipal pollution abatement projects each year. If the \$7.5 billion in funds tied to the deficit reduction goals are funded, additional construction could be funded from 1994 through 2000. This increment will still leave Massachusetts far short of its need.

Title I of Senate 1114 provides for the development by the EPA of a new SRF allocation formula, based on need for all eligible categories and the need for projects covered by a watershed management plan. We strongly support an allocation formula predicated upon actual documented needs. At present, Massachusetts has the third highest total needs (\$7 billion) in the nation and the highest *per capita* needs of all of the industrialized states. Yet, the current funding allocation formula ignores this all-important fact. The new allocation formula should be implemented as swiftly as possible. We underscore our support of provisions in the bill to finance and utilize comprehensive watershed management plans, to better target states' efforts in making effective water pollution control decisions.

On the issue of project eligibility under SRFs, we favor an expansion of the currently limited eligibilities, to include combined sewer overflow and stormwater control programs, implementation of watershed plans, implementation of clean lakes protection projects, and technical and financial management assistance for subsurface disposal systems. There are a multitude of "non-traditional" wastewater projects currently ineligible for CWA funding, primarily in the urban northeast and in small rural areas across the country. For example, Massachusetts, in particular, is faced with tremendous combined sewer overflow problems in its older cities. Stormwater pollution is the number one nonpoint source of water quality degradation in Massachusetts' coastal and inland waters. Massachusetts applauds Senate 1114's expanded eligibility criteria under the CWA for funding these kinds of projects.

Under the current CWA, limitations with regard to eligibility for federal funding are also felt by wastewater treatment projects with enormous capital costs, such as Massachusetts' Boston Harbor project. New Bedford, MA is another example of a community with wastewater treatment project costs that exceed the ability of the municipality and its ratepayers, even with state assistance, to pay. We encourage the addition of provisions in Senate 1114 which recognize the particular difficulties of funding large wastewater treatment projects.

I wish to emphasize our grave concern with regard to securing the \$100 million appropriated in the FY '94 Budget for the Boston Harbor project. This amount was appropriated *pending authorizing language in the CWA reauthorization by March 1, 1994*. As CWA reauthorization may not occur by this deadline, we urge that Congress take the necessary action to ensure this \$100 million is not lost to the Boston Harbor project.

TITLE II. Senate 1114 provides for the development and strengthening of guidelines and effluent criteria for toxic pollutant discharges. Massachusetts strongly endorses the provision for new EPA authority to issue *guidelines* for source reduction practices, including elimination of discharges whenever feasible and prohibiting or limiting the release of pollutants to other environmental media. There should be as much emphasis as possible in the bill to support waste minimization and recycle/reuse initiatives.

We do not see in Senate 1114 a reasonable process or mechanism which would allow states to modify technical criteria, policies, and permit limits according to local and regional water quality conditions. Such an allowance would be particularly important for heavy metals where there is no evidence of in-stream toxicity. Unreasonable and unfair limits defeat the general purposes of the CWA.

We strongly support the bill's requirement to develop sediment criteria, to strengthen antidegradation provisions for sediment quality, and to develop a national policy on mixing zones.

Section 205 of Senate 1114 establishes a pollution prevention planning process for industrial dischargers. Dischargers of pollutants which, if reduced, would benefit human health or the environment, are to develop pollution prevention plans for these pollutants and other toxics as part of their permit applications. We strongly support this planning requirement, as it could result in meaningful pollution reduction over the life of the permit and would complement Massachusetts' innovative Toxics Use Reduction Program. Our toxics reduction program aims to cut toxic waste generation by 50% by 1997. With cumulative degradation occurring in our waterways from multiple sources of pollution, it is no longer sufficient to simply meet water quality standards where additional reductions are possible and economically achievable.

TITLE III. The Commonwealth strongly supports the expansion of authority for watershed based implementation of CWA goals. Providing states flexibility to develop watershed based approaches to water pollution control is excellent, and sorely needed. It makes both economic and environmental sense to do a whole watershed assessment to determine how to best target pollution control measures for the most effective expenditure of both regulatory and infrastructure capital. States can get more environmental quality for fewer dollars if they are allowed to use a combination of controls, including pollution prevention and nonpoint source management as well as the traditional end-of-the-pipe point source controls to attain fishable/swimmable waters. States also need the flexibility to take into account groundwater contribution to surface water quality degradation in determining where to direct pollution control measures.

As I noted previously in this testimony, in Massachusetts—as in most of the rest of the country—nonpoint source pollution is the main water pollution culprit, yet the current CWA is focused primarily on point-source discharges. The traditional focus has meant spending millions of dollars for small increments of pollution reduction rather than spending the same or possibly less money reducing nonpoint sources and implementing point-source pollution prevention measures. The watershed approach will be a way of setting clean-up priorities based on the biggest bang for the buck in each river basin. It will also mean some relaxation of the point-source control constraints that have, in some instances, not served us in a cost-effective manner. To illustrate this point, I call your attention to two examples where a reshuffling of priorities may in fact produce greater improvements in water quality: In the metropolitan Boston area, stormwater is believed to contribute more to the failure to meet fishable/swimmable goals in Boston Harbor and its major tributaries than combined sewer overflows (CSOs), but the CWA provides no funding to states for stormwater remediation. And the federal government, in conjunction with the states, is spending millions for immediate toxicity controls at sewage treatment plants rather than targeting time and resources to reducing the pollution at the source or to identifying and controlling other, more serious sources of toxic pollution for less money. Incorporating a watershed approach in the CWA can be a "win/win" for regulators and the regulated community, and provide for more effective environmental protection.

Senate 1114 specifies that watershed plans are to characterize waters and land uses of the watershed, identify water quality problems, identify goals for watershed management, allocate needed load reductions among point and nonpoint sources, and identify needed financial resources and the institutional arrangements needed to carry out the plan. We strongly support this prescription for watershed plans, but caution that watershed based permitting must build on the knowledge, successes and failures realized since the inception of the CWA. The watershed planning established by Senate 1114 must not recreate the Section 208 master planning work accomplished in the 1970's; rather, it must expand and integrate real implementation goals into a results oriented watershed planning and permitting program. Emphasis must be placed on the allocation of needed load reductions within watersheds and the identification of financial and institutional resources needed to implement watershed plans. Implementation is key.

Massachusetts strongly encourages the regulatory development of a watershed-based effluent reduction trading program that could significantly reduce the cost of meeting water quality standards. Similar market-based incentives have worked effectively in controlling air pollution and should now be applied to other media, such as water. An effluent trading program could ensure the overall quality of the water resource by determining the total amount of pollutants that can be released without compromising water quality standards. A successful effluent reduction trading pro-

gram could potentially include both point and nonpoint sources and provide significantly greater cost-effectiveness than traditional command and control approaches. Massachusetts suggests that the CWA be amended to specifically sanction (or even promote) effluent reduction trading.

Another important addition to Senate 1114 which would greatly assist in the implementation of a watershed approach under the CWA would be provisions to fund the development and use of regulatory and management tools, such as Geographic Information System (GIS). GIS, a complex system of resource mapping in the early stages of development in Massachusetts, would assist regulators and managers in applying water quality standards and pollution requirements in the most sensitive or degraded areas.

Senate 1114's proposed standardization of monitoring and reporting timelines to five years instead of two years would greatly improve the ability of states to manage limited resources for these purposes. Massachusetts strongly supports this provision, as well as the provision establishing new authority for the EPA or states to require dischargers to monitor receiving waters (in addition to their effluents). States are hard pressed from a resource standpoint to accomplish this monitoring on their own. Ambient water quality monitoring is critical to understanding the interplay of individual discharges with each other and the cumulative impacts of multiple discharges on background water quality. With receiving water quality information, regulators can better target controls to the significant sources of water quality degradation.

Massachusetts supports the inclusion of stronger enforcement guidelines for nonpoint source controls. Improved enforcement of nonpoint source control measures will safeguard the initial water quality successes of point-source pollution controls.

We would like to see stronger links made between the EPA's administration of the Section 319 nonpoint program and the administration of other federal programs, as has been attempted with federal transportation legislation—to include agriculture, forestry, and public works projects, for example. We support provisions of Senate 1114 which provide for the coordination of various federal agencies in water quality improvement.

We applaud Senate 1114 for linking two important policies of the Weld-Cellucci Administration: watershed management and privatization. Senate 1114 allows for nonprofit private organizations to assume the role as stewards for a state designated watershed management area. This provision recognizes the significant interest and expertise of many nonprofit environmental organizations in protecting our water resources, and the many benefits of public-private partnerships.

TITLE IV. Massachusetts supports provisions of Senate 1114 which extend the time periods required to eliminate, in a reasonable way, discharges from CSOs and urban stormwater. We stress, however, that these modifications should be carefully integrated with other policy and funding provisions so as to maximize resolution of these serious water quality problems. New stormwater discharges should be required to implement Best Available Technologies (BAT). For existing discharges, an aggressive interim schedule requiring regular improvements should be developed. This schedule, based on a municipal/state priority plan, (i.e. part of a watershed plan), could be incorporated into permits, consent orders or both.

Massachusetts supports language under Title IV which targets assessment of the principal sources of pollutants in stormwater. Again, these data must be integrated into watershed plans, so that informed decisions on where to focus limited resources for water pollution control can be made.

Massachusetts is making considerable progress in water conservation, but a great deal more can and must be done. Conservation efforts are central to protecting public water supplies and water resources dependent on maintenance of groundwater levels and instream flows, and to reducing the cost and maximizing the efficiency of wastewater treatment. Accordingly, we support Section 403 of Title IV, which would authorize the Army Corps of Engineers to assist states in water conservation and the EPA to coordinate federal policies on municipal, industrial, commercial, and residential water conservation. The proposed national clearinghouse on water conservation would benefit government, industry and residential users alike and should be adopted.

TITLE V. We support the provision under this title which calls upon the EPA to work with federal and state agencies to identify sensitive aquatic systems that support valuable biological resources. Also of importance is the provision directing EPA to issue biological monitoring methods for establishing the biological condition of waterbodies. Massachusetts is evaluating the establishment of biological criteria for wetlands whose water quality can't be measured by levels of conventional pollutants (for example, Biochemical Oxygen Demand and Total Suspended Solids) which vary

seasonally. We would find guidance from the EPA regarding biological monitoring methods helpful.

Also under this Title, we support the authorization of EPA to issue special experimental permits for facilities proposing to test innovative or alternative technologies, as long as water quality standards are required to be met.

TITLE VI. Massachusetts is currently establishing an innovative and Alternative Wastewater Treatment Technologies program which would benefit greatly from provisions of Senate 1114 authorizing funding and programs to demonstrate new or significantly improved water pollution control practices, methods, technologies, or processes. Especially noteworthy is Senate 1114's recognition of the need to promote technologies which have the potential to control pollutants that present risks to human health, to advance pollution control of regulated industries, to foster pollution prevention, or to advance the control of point and nonpoint sources of water pollution.

Massachusetts strongly supports the provision providing for National Estuary Program funding, specifically funds for implementation of Comprehensive Conservation and Management Plans beyond the initial five year planning phase of these programs.

CONCLUSION

I again thank you for the opportunity to appear before you today to testify on this landmark piece of water quality legislation. Please register Massachusetts' vigorous support of Senate 1114 and consider the important amendments we have offered today. We thank you, Chairman Graham, for your leadership in reauthorization of the CWA.

Special thanks to Senator Baucus and Senator Chafee, for your recognition of the new directions the CWA must take to accomplish real improvement in the quality of the nation's waters. Thanks also to the distinguished members of the Committee, for their aggressive support of Senate 1114.

TESTIMONY OF DOUG MACDONALD, EXECUTIVE DIRECTOR, MASSACHUSETTS WATER RESOURCES AUTHORITY

Mr. Chairman, thank you for the opportunity to present this testimony during your hearings on the reauthorization of the Clean Water Act. I also want to thank Senators Kennedy and Kerry for their statements in support of the Authority's need for special funding.

The Massachusetts Water Resources Authority is a wholesaler of wastewater treatment services and water supply to over 2.5 million people in eastern Massachusetts. The Boston Harbor Project, which will provide secondary treatment for the wastewater generated in the district, allowing compliance with the Clean Water Act, is the largest sewage treatment facility under construction in the United States. We are building it under a Federal court ordered schedule that requires completion by 1999. Even though the milestones in the court order are demanding, we may be able to complete some elements of the project even earlier than scheduled. Already, we are seeing environmental benefits in the Harbor from some of the improvements we have made, such as the sludge processing plant that now keeps sludge out of the Harbor.

The Boston Harbor Project is a massive undertaking, bringing our sewage treatment system from its seriously deteriorated and inadequate condition in the early '80s to a state-of-the-art facility serving the entire metropolitan area by the end of this decade. It is extraordinarily expensive, however. The Boston Harbor Project itself will cost an estimated \$3.8 billion. The costs of CSO improvements and other related projects will bring the total for wastewater through FY 1999 to over \$4.3 billion. The Authority is also facing nearly \$800 million in water supply system costs over that same period.

We are doing what we can to reduce these costs. We are exploring with the court the downsizing of the secondary treatment plant, to treat the smaller flow our more refined estimates and metering now show we can expect. And the EPA CSO control policy endorsed by S. 1114 may allow to reduce our costs for CSO compliance, particularly in the period after FY 1999. We are also hopeful that other provisions of this year's Clean Water Act Reauthorization, such as the watershed planning provisions, will allow us to find other ways of reducing the wet weather flow of pollutants to Boston Harbor and other receiving waters, and reduce our need to control CSOs so stringently. The project will still be very costly even with these reductions.

We know it is difficult, in these days of tight budgets and many competing demands, to talk of special funding for a single major project. Let me try to tell you why the Boston Harbor Project is special, and why we need these funds so desperately. Mr. Chairman, this project is like the big city sewage treatment plants built in the '70s and early '80s with Federal grant assistance, but it differs in important ways. First, we did not have an adequate primary treatment plant and collection infrastructure onto which we could add the required secondary treatment plant. We literally started from scratch. Second, this project is late, because of the extended dispute between Boston and EPA and other local interests over the possibility of a waiver of the secondary treatment requirement under section 301(h). That dispute is resolved, and court has ordered compliance by 1999. The Authority is committed to full compliance with the mandates of the Clean Water Act and the retirements of the decree under which we operate.

The result of our compliance with the federal law has been massive rate increases. Water and sewer charges in Boston are now the first in the nation. As a result, wholesale rates have increased 600% since 1985. These rates now average over \$570 a year for every household in our service area. Without major relief on our capital investment or debt service, we expect those rates to at least nearly double again, to \$1,000 per household by 1999. We need help—the land of grant assistance our sister cities received for their wastewater treatment systems. To date, this project has only received about 8% of our total capital costs in Federal assistance, even with the special appropriations of the past few years. It is the debt service costs we face, having to fund this project virtually alone, that make our rates rise so dramatically. Debt service on our current capital investment approaches \$200 million a year. As we have to borrow more to complete the project, annual debt service may exceed \$360 million by FY 1999.

We are facing a citizen revolt with our ratepayers. They have thrown their sewer bills into the Harbor in protest, in a later-day "Boston Tea Party". The rate rebellion is the hottest political news in Boston, constantly discussed in all the media. The political consensus for completing the project is threatened, and it may be difficult to maintain the support for the project that is needed to continue to make progress, without evidence that the Federal Government is willing to commit funds to help meet the mandates of the Clean Water Act and the Federal court. We are spending a lot of our own money on this project, borrowing extensively and carrying high level of debt service. We are doing what we can to reduce costs, carefully managing our spending. We are also receiving some assistance from the State, particularly on short term rate relief. But the ratepayers are still bearing 90% of the costs of this project. They will not be able to carry that load as it gets heavier and heavier. If we want a clean Boston Harbor, we need a larger Federal contribution toward that goal.

So we are asking the Committee for several things. First, we ask that you act on authorizing legislation so that the money for the Boston Harbor Project contained in the FY 1994 EPA appropriations bill can be released. The Administration requested \$100 million for the Boston Harbor Project in its FY 94 Budget. The House-passed appropriations bill contains an appropriation for grants for Boston and other projects, but the bill requires that the use of such funds be authorized prior to March 31, 1994, or these funds may be lost. We ask that you provide the authorization for such a grant to MWRA, in a timely manner. The earlier we receive the money during in FY 94, the more we can avoid borrowing that will otherwise be necessary, reducing debt service and rate increases over the whole life of the project. The Committee may provide this as a separate short-term authorization, or as part of the larger long-term reauthorization of the Clean Water Act.

MWRA needs a long-term commitment of Federal funding, as part of the programs of the Clean Water Act. It is not essential that such programs single out Boston. A well-designed program that meets Boston's needs may also benefit other communities. S. 1114 contains a broad-based program accepting the principle of grant assistance or loan forgiveness to provide rate relief, the so-called "Disadvantaged Communities" provisions, and we applaud you for including this concept in the bill. There are several features of the legislation, however, that make this program insufficient to help Boston, such as the limitation to 20% of a State's annual SRF allocation, the limitation to \$20 million overall in loan forgiveness, and the way the threshold qualifications for excessive sewer rates are stated. The Authority would be happy to work with the Committee on redrafting the qualifications to assure that communities like the MWRA service area, with massive rate increases, actually do qualify for special assistance. I suspect, however, that capital assistance of the magnitude required by the Boston Harbor Project may be harder to accommodate within the Disadvantaged Communities program without significant redesign.

This program does contain the germ of what we are requesting, though, and we would be pleased to work with the Committee to expand it in a way that will offer meaningful assistance to the Boston Harbor Project.

To keep the Boston Harbor Project viable, MWRA suggests these provisions for the long-term reauthorization of the Clean Water Act:

- We strongly urge a special program of grant assistance for communities with high capital costs for secondary treatment needed for compliance with the Clean Water Act, and unacceptably high sewer service rates as a result. It is critical that this assistance be provided as grants, because only this type of subsidy of capital costs will reduce debt service, and therefore rates to users, over the life of the project
- The Authority is very grateful for the level of funding requested by the Administration in the FY 94 Budget. A higher level of capital assistance, however, sustained for the full authorization period of the Clean Water Act, is actually needed to produce the kind of rate relief and equity we are requesting. We suggest the Committee consider the level of authorization provided by S. 350, introduced by Senators Kerry and Kennedy, of \$200 million per year over five years. This could be provided in a single authorization, or could be the aggregation of grants available under several programs for which the Authority might qualify.
- Funds for municipal wastewater treatment plant construction should be allocated on the basis of a needs survey reflecting the costs of remaining eligible projects necessary to meet the requirements of the Clean Water Act. The funds authorized by this legislation should no longer be allocated under the old allotment formula, using old population figures and out-dated estimates of needs.
- We hope there will be adequate flexibility provided in any grant program for which MWRA qualifies so that some portion of the money may be used to reduce debt service in addition to the major purpose of capital assistance.

There is much in S. 1114 that appreciates and supports, and we look forward to working with the Committee to refine this legislation. For this bill to make a lasting contribution to clean water in Massachusetts, however, it must contain a significant level of grant assistance for the Boston Harbor Project. I have outlined several areas where I believe the bill could be strengthened.

Thanks again for the opportunity to testify on the needs of MWRA in this year's reauthorization of the Clean Water Act.

STATEMENT OF TOM BEHR, DEPUTY MAYOR, CITY OF SAN DIEGO

Mr. Chairman, I am Tom Behr, Deputy Mayor of San Diego. Thank you for inviting me to testify before your Committee today.

There are two primary requests that I am making to you and the Committee. The first is that the Clean Water bill be written in a manner that allows a city such as San Diego to continue to use advanced primary treatment where there is a deep ocean outfall which provides the equivalent environmental protection of secondary treatment. The second is that wastewater reclamation be eligible for funding under Title V of the Act.

Both of these requests fit into our priority considerations for continuing to protect both San Diego's and our nation's waters. These requests result from decades of experience in San Diego in working on Clean Water issues. In addition, my comments reflect the conclusions reached in the National Academy of Science report which recommends changes for coastal protection that should be considered in a new Clean Water Act.

Our two requests for changes in the law are dictated by the needs of California in reducing pollution, improving our overall water quality and protecting our coastal waters. We are looking at the San Diego region as a broader ecosystem where we face a variety of water quality threats from non-point source runoff, from Mexican sewage flowing across our border and from a need to enhance our long range drinking water supply. To protect our greater geographic area we believe that it will take local initiative and additional funding. This is the reason that it is very important to the residents of San Diego that the requirements for Clean Water Act compliance allow the City to utilize its scarce funding to provide the greatest possible protection to the environment. This can best occur by continuing the use of the Point Loma Advanced Primary Treatment Plant in conjunction with its Deep Ocean Outfall and its ambitious wastewater reclamation program.

Point Loma Outfall

The existing Clean Water Act does not allow for the City and the Federal District Court to take the steps necessary to fully protect our ocean with a program that makes the best use of resources. Existing Clean Water requirements for the San Diego Ocean Outfall ignore sound science, ignore regional differences and ignore new and improved technology for treating sewage.

The existing law requires the construction of a wastewater treatment program that will cost San Diego ratepayers billions of dollars. San Diego seeks the option to develop a wastewater treatment program that has the same environmental protection, but at a cost of \$1.3 billion. The reason for this cost difference is the Clean Water Act requirement that the City must reach a secondary treatment standard.

However, with a deep ocean outfall, there is no demonstrable difference in environmental impact between secondary treatment effluent and San Diego's present advanced primary treatment effluent. To allow San Diego ratepayers to save one billion dollars with no reduction in the protection to the environment, we are asking that the reauthorized law be written to allow for this special circumstance.

In San Diego we have an ocean floor that slopes steeply away from the shoreline, accessing deep marine waters within a few miles offshore. We have an open coast that is a part of the vast expanse of the Pacific Ocean. We have swift currents and dynamic mixing in the waters off Point Loma.

We also have in place the technology that we need to ensure environmental protection. San Diego currently operates a state-of-the-art advanced primary treatment plant that discharges treated wastewater to the Pacific Ocean through a deep ocean outfall. This outfall currently discharges in 220 feet of water over two miles offshore.

The Point Loma Outfall was designed to protect bathing beaches from contamination. It has done so without exception over the past thirty years. When California's State Ocean Plan was amended to protect not only swimmers at bathing beaches but also divers in the offshore kelp beds, San Diego planned the extension of its outfall even farther offshore—4.5 miles—and into deeper waters—320 feet below the surface.

This extension, which is currently under construction, will make San Diego's outfall the longest and deepest reinforced concrete structure in the world.

San Diego has monitored the effects of the existing discharge on the marine environment for thirty years and has found that *there is no significant impact*.

In the EPA's federal court lawsuit against the City in 1991, Federal Judge Rudi Brewster considered a significant amount of evidence presented by a cross-section of the best scientists in the country—ours and yours—and found that *there is no adverse impact*. Please understand that the City's position of no adverse environmental impact is not mere opinion or posturing. Rather, it is a validated judicial finding.

Regional Environmental Protection

The National Academy of Science report, published in April, clearly shows that we can balance protecting our precious ocean environment with the needs of San Diego's sewage system by setting water and sediment criteria and standards.

Most importantly, it confirms what San Diego has been saying for years: advanced primary treatment is appropriate for San Diego's deep ocean environment at the Point Loma Outfall.

The National Academy's report provides a scientific foundation for Congress to protect the coastal marine environment by amending the Clean Water Act to reflect regional science and geography.

Water Reclamation

San Diego has a long-term strategy for wastewater treatment, and environmental protection—it is called the Consumers' Alternative. A major element in the program is the construction of a 30 (expandable to 55) million gallons per day (mgd) wastewater reclamation plant, which will cost \$166 million. It is an ambitious initiative that will allow the City to initially reclaim 30 mgd of wastewater and utilize it for a number of purposes for which limited and expensive potable water is used today. That construction is underway as I speak today.

A major thrust in S. 1114 is the protection of our waterways from toxic pollution and non-point source pollution. While those objectives are also an integral part of the Consumers' Alternative, we urge you to consider an additional and unique program faced by California cities in their water programs. If too much water is used by agriculture and cities, the natural ecology of our streams, rivers and lakes is threatened. San Diego has taken steps to cut its water demand through an extensive

volunteer conservation program. A 20% reduction in average water use has been achieved over the past three years.

It seems that the region has achieved almost the maximum amount of water savings through our home and business water conservation program. Now we are looking to water reclamation as the next major step in the program. I think that water reclamation should be considered in the amended Clean Water Act. Reclamation is a tool for wastewater management. In San Diego, by replacing the 30 mgd in peak demand and a lesser amount year round, we greatly relieve the pressure and demand for greater water supply from the Colorado River and the lakes and rivers in our state. It is folly to pump the effluent into the Pacific Ocean when it can meet some additional demand through a water reuse program.

Costs

I mentioned earlier my concern over the cost faced by the City if amending the Clean Water Act does not include consideration of the unique circumstances in San Diego. While the cost is significant, it is even more of a burden when we realize that San Diego has had a low priority for EPA grants and for State Revolving Fund (SRF) loans.

From 1972 to 1987, the Clean Water Act provided funding for no more than 75% of the cost of secondary treatment improvements. The State of California provided a matching amount of 12.5%. The remainder was eligible for state loans. The administration of Clean Water grants was left to the states, and the California Regional Water Quality Control Board established a priority list of projects to receive funding.

From 1970 to 1986, the City of San Diego received just \$95 per capita in grant funding under the Clean Water Grants program, just 25% of the statewide average of \$383 per capita. San Francisco received \$1696 per capita, nearly four-and-one-half times the statewide average. Sacramento received \$683 per capita, nearly double the statewide average.

From 1987 to today, the City of San Diego has received just \$30 million towards the cost of a \$2.8 billion plan for secondary treatment. Because we meet the State Ocean Plan requirements, the City is a low priority for funding under the State's Revolving Loan Program. Under the current system we estimate that 99% of the costs to upgrade our sewerage system will be paid for by local ratepayers. I don't think that's what the Congress intended when it passed the Clean Water Act in 1972.

Conclusion

San Diego has a strong wastewater management program. It includes treatment, conservation and reclamation. It is important that the Clean Water legislation this Committee writes provides San Diego the framework to continue to implement its program and enable us to continue to protect our precious coastal waters without spending one billion dollars on a treatment facility at Pt. Loma that provides no discernable additional benefit to the environment.

Thank you for the opportunity to be here today.

STATEMENT BY E. (KIKI) DE LA GARZA, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TEXAS

Mr. Chairman and Members of the Subcommittee, thank you for holding this hearing on various watershed planning issues as they relate to congressional reauthorization of the Clean Water Act. I commend you Mr. Chairman for including both the special problems associated with the Gulf of Mexico coastal areas as well as the water service problems faced in colonias along the U.S.-Mexico border.

The Gulf of Mexico is a vital economic resource for our country. The Gulf is the source of over 30 percent of the domestic fish and seafood marketed here in the United States. More than 90 percent of U.S. and Mexican oil production comes from offshore oil wells located in the Gulf. Ports along the Gulf handle 45 percent of the tonnage that passes through all U.S. ports. We have the growing resort and recreation industries along the Gulf coastline that generate approximately \$10 billion per year in revenues.

But the Gulf region is more than an economic asset, it is also an environmental asset. The Gulf and its coastal areas comprise one of North America's most important and fragile ecosystems. Three-fourths of the North American landmass drains into the Gulf. The wetlands in the Gulf region provide habitat for more than 75 per-

cent of the migratory waterfowl of North America. The region is a breeding ground for a astounding variety of sport and commercial fish and shellfish species.

It's the health and future of this ecosystem that brings us here today. The simple fact is the Gulf's fragile ecosystem is threatened on several fronts by man's activities.

For too long we have been of the mindset that economic development and environmental protection are mutually exclusive and diametrically opposite objectives. It is time to break out of that way of thinking.

If the Gulf of Mexico is to continue to be a productive economic resource, we must do a better job of managing—and yes, in some cases, protecting—its waters, its coastal wetlands and its beaches.

That is why I have introduced H.R. 1566 on the House side. It's Senate counterpart is S. 686 which is cosponsored by Senator Graham of Florida and Senators Breaux and Johnston of Louisiana.

Basically, this legislation has three principal components. First, it would require the Department of Agriculture to conduct a complete inventory of laws and regulations affecting agricultural wetlands. Second, it would establish a Federal-state coordinating body, a partnership, if you will, in the form of a Gulf of Mexico Commission. Third, it would formally establish the Gulf of Mexico Program within the U.S. Environmental Protection Agency.

My objective is to promote sensible and sustainable economic development of the natural resources of the Gulf of Mexico and the surrounding coastal areas. Let me briefly explain these three major components.

Inventory of agricultural wetlands and regulations: Probably no area of environmental policy has been a source of greater controversy and confusion for farmers than the regulation of wetlands.

We have four Federal agencies—the EPA, the Army Corps of Engineers, the interior Department's Fish and Wildlife Service and USDA's Soil Conservation Service—regulating wetlands or various aspects of wetlands issues. There are also State laws and regulations affecting wetlands.

My bill requires the Secretary of Agriculture to conduct a complete inventory of all the Federal and state laws and regulations affecting the use of wetlands for agricultural production. This information is to be used by the Secretary in developing recommendations on how to clarify, consolidate, better coordinate, harmonize and simplify the regulation of agricultural wetlands. My legislation would also require the Secretary to look specifically at these issues as they affect the Gulf region and what can be done to foster the prudent use of agricultural lands in these states.

Gulf of Mexico Commission: Today there is no coordinating, on-going public entity for the Gulf region as there is for the Great Lakes and the Chesapeake Bay.

H.R. 1566 would establish a Gulf of Mexico Commission, comprised of Federal and state officials and non-government representatives. The Gulf of Mexico Commission would be responsible for setting resource and development goals for the Gulf of Mexico region. The Commission would seek to better coordinate the various Federal, State, local and private sector activities aimed at protecting and developing the Gulf of Mexico.

EPA Gulf of Mexico Program: H.R. 1566 would also formally establish a Gulf of Mexico Program at EPA. It would require that this program be administered by an EPA office located in one of the Gulf states. H.R. 1566 would also direct EPA to work closely with the Gulf of Mexico Commission in setting environmental policy in the Gulf region.

I believe the Commission concept and the EPA Gulf of Mexico Program office are essential to fostering trust and cooperation between all levels of government, with industry, and with the concerned public.

Mr. Chairman, there is also an international aspect to the Gulf's problems and solutions. For you see, the Gulf is also our "other border" with the country of Mexico.

I believe congressional action to begin addressing the Gulf of Mexico's problems would encourage Mexico and other Caribbean countries to take similar steps. I have discussed this issue with Mexican President Salinas and his Secretary of the Environment, Luis Donaldo Colosio, and his Secretary of the Fisheries, Guillermo Jimenez Morales—and they share our interest in this area.

Mr. Chairman, I believe we can and must do a better job of balancing man's economic needs and the Gulfs environmental health. I have introduced H.R. 1566 as one set of policy options for your consideration. I look forward to working with the members of this Senate committee and with the members of the House Merchant Marine and Fisheries on this issue.

Mr. Chairman. I also want to commend this Subcommittee for focusing its attention on the water-related problems faced by the quarter of a million people who live in the impoverished American communities called colonias along our Southwestern border.

I represent one of the congressional districts that has a number of colonias. I have fought throughout my congressional career for Federal and state funding to bring basic water and sewer services to these people.

It's my understanding that the conference report for the fiscal 1994 agricultural appropriations includes \$25 million in USDA funding for colonia water projects. I worked hard for this funding on the House side and I'm pleased to hear it has been included in the bill.

While we have made considerable progress, I must admit that much, much more needs to be done.

I have been working with USDA to establish a clearinghouse network to help disseminate information to colonia residents on the various types of Federal, state and non-governmental assistance available to help them.

I might also add that last year's agricultural appropriations bill instructed USDA to provide Congress with an inventory of the Federal programs available to colonia residents; and a Federal action plan on how we can better address these issues. The inventory report is expected soon, I am told. The action plan will be submitted later this year.

Finally, Mr. Chairman, I would like to bring to your attention another piece of legislation I have introduced (H.R. 2545, the Colonia Assistance Authorization Act of 1993) that deals specifically with colonias. H.R. 2545 would formally authorize EPA to provide financial assistance for the construction of water supply systems and the installation or improvement of sewers and wastewater facilities serving colonias.

This legislation seeks to establish a remedy action taken by the House of Representatives that stripped language targeting \$50 million for colonia water projects out of the fiscal 1994 EPA appropriations bill. It is my hope that this legislation could be included in the Clean Water Act reauthorization.

Mr. Chairman, I appreciate your interest in the problems of the colonias and hope this committee would see fit to help us focus Federal resources and attention on this issue. Thank you for allowing me the opportunity to testify here today.

STATEMENT OF HON. JOHN GLENN, U.S. SENATOR FROM THE STATE OF OHIO

As Co-Chairman, along with Senator Durenberger, of the Senate Great Lakes Task Force, I would like to commend Chairman Graham and the Environment and Public Works Committee for holding one of its Clean Water Act hearings on Great Lakes and other regional programs. It is appropriate, I think, that we focus special attention on the Great Lakes in this reauthorization of the Clean Water Act, as the Great Lakes contain roughly 95% of the nation's fresh surface water, and remain the most valuable freshwater resource on our planet.

I would like to begin by expressing my strong support for S. 1183, the Great Lakes Clean Water Act Amendments of 1993, of which I am an original cosponsor, and by acknowledging the efforts of my colleague, Senator Metzenbaum, in introducing this omnibus Great Lakes bill. I am the author of certain provisions of the omnibus bill, relating to sediment reduction, pollution prevention for cities, and Great Lakes research coordination. In a moment, I will elaborate on these provisions, but I would first like to comment generally on the importance of the Great Lakes and a continued federal commitment to their protection and restoration.

The Great Lakes are a precious freshwater resource, supplying millions of Americans with a livelihood, drinking water, recreation and inspiration. They also support a fragile and unique natural ecosystem and require special care by all its users—basin residents, industry, and government, alike. We of the Great Lakes region continually strive for better environmental protection for this irreplaceable resource which we are so fortunate to have in our backyards. We have seen much progress over the years, most visibly evidenced by the remarkable return of Lake Erie from the "dead". Yet many challenges remain, and it is our responsibility to find innovative and cost-effective solutions to today's complex environmental problems.

According to the EPA, fishing and swimming are not what they should be along a full 90 percent of the Great Lakes' United States shoreline. Picturesque harbors contain contaminated and harmful bottom sediments, and all of our Great Lakes states issue advisories to warn the public of potential health risks of eating too many of certain kinds of Great Lakes fish. This situation is unacceptable.

This year, we have special legislative opportunities to help the Great Lakes environment as Congress takes up the reauthorization of the federal Clean Water Act. With so much of the nation's fresh surface water in our basin alone, we have a keen interest and a high stake in successful national and regional provisions of the Clean Water legislation.

In order to address the difficult problems that continue to plague the Great Lakes ecosystem, I joined with several of my colleagues on June 30, 1993, in introducing the Great Lakes Clean Water Amendments Act of 1993, S. 1183. This bill addresses several areas of need for the Great Lakes, including sediment management, pollution prevention and research coordination.

The Great Lakes Sediment Reduction provision applies the principles of pollution prevention to the sediment problem in the Great Lakes. Currently, excessive loads of sediment migrate to our Great Lakes harbors polluting them and creating high costs for removal and disposal—costs that no one wants to bear. An average of 5 million cubic yards of sediments must be dredged from Great Lakes harbors each year at an expense to the taxpayer of \$33 million per year. About 50 percent of these dredge spoils are so contaminated that they are disposed of in special confined disposal facilities.

This sediment pollution of our harbors need not be a fact of life. The sediment originates upstream as runoff pollution, and to a large extent can be abated there as well. And prevention of sediment pollution in the Great Lakes will save money for all involved: the EPA; the ports and the Corps of Engineers, which are responsible for sediment removal; and even the upstream landowners who will benefit from keeping more of the soil on the land.

The Sediment Reduction provision of our omnibus bill will authorize and direct the US Army Corps of Engineers to map out where this sediment originates on a river system-by-river system basis, and authorizes the Corps to provide technical and financial assistance for voluntary upstream best land management projects that will result in a cost savings in their dredging and disposal operations. I introduced this measure as a stand-alone last Congress, and look forward to enactment as part of the Clean Water Act this Congress.

My Pollution Prevention for Cities Program also builds our ability to stop pollution at the source. This measure will establish a technical assistance program within the EPA for municipalities within the Great Lakes basin to help them comply with new water quality rules in the most cost-effective way possible. The program is targeted at source reduction of toxic constituents in urban runoff, wastewater and stormwater. The measure also authorizes the use of State Revolving Fund monies for municipalities to implement EPA approved source reduction plans. Again, prevention is the most effective and least cost approach to pollution abatement, and cities should be provided with the assistance they need to stop pollution at its source.

The third measure of which I am the Senate author is the Great Lakes Research Coordination provision. This provision will require federal agencies that conduct ecosystem research in the Great Lakes to jointly develop priorities and a coordinated plan for addressing them. This measure will increase the efficiency with which we gather information so important to sound environmental protection decision-making.

I would like to conclude by reiterating my strong support for the Great Lakes Clean Water Act Amendments of 1993; it is a practical, useful and beneficial bill. I urge the Committee to include these critical Great Lakes provisions when marking up its Clean Water Act reauthorization package, and I look forward to working with the Committee in the months ahead. I commend this Committee for making Clean Water Act legislation such a high priority in this Congress. The Great Lakes and our nation's waters deserve such a commitment.

TESTIMONY BY GREG LAUGHLIN, A REPRESENTATIVE IN CONGRESS
FROM THE STATE OF TEXAS

Having grown up on the Gulf of Mexico, and representing the District in Texas with the most coastline along the Gulf, I have long been committed to raising the priority of Gulf issues.

On April 28, 1993, Congressman Sonny Callahan and I introduced H.R. 1899, the Gulf of Mexico Economic and Environmental Protection Act.

The bill has the bipartisan support of 55 members of congress and is the culmination of a four year effort by the Sunbelt Caucus to enact legislation to protect the Gulf of Mexico.

This bill will prevent the Gulf of Mexico from turning into an Environmental Catastrophe, such as the Great Lakes and Chesapeake Bay once were.

It emphasizes the need to improve water quality in the Gulf of Mexico, reduce coastal erosion, ameliorate the economic loss of fisheries in the Gulf, and address other economic and environmental issues.

The Gulf of Mexico Economic and Environmental Protection Act will establish a Gulf of Mexico Executive Board with each member having an equal vote.

This board includes representation from the citizen's advisory committee, local communities, each Gulf State, and each federal agency with jurisdiction over the Gulf of Mexico.

I believe the involvement of coastal elected officials will ensure that those who deal with the Gulf everyday are included in the decision-making process.

Another important aspect of our bill is it ensures that we comprehensively address the economic and environmental issues of the Gulf of Mexico.

I want to emphasize that the intent of this bill is to balance environmental protection with economic progress.

It is high time that the economic and environmental significance of the Gulf of Mexico be recognized.

There are two such programs currently in existence which protect and manage the Chesapeake Bay and the Great Lakes.

Although the Gulf is seven times larger than the Great Lakes and almost 200 times larger than the Chesapeake Bay, the Gulf of Mexico receives dramatically less EPA funding than those two bodies of water.

For example, in 1993, the EPA is spending less than \$5 million on Gulf of Mexico Program activities while spending \$35 million and \$24 million the Great Lakes and Chesapeake Bay Programs, respectively.

Surely a body of water so rich in environmental resources, so rich in economic resources, and yet so impacted by activities that occur as far away as Minnesota should get more federal attention than it has historically.

I want to emphasize the National importance of the Gulf of Mexico, the incredible contribution it makes to our country, and its great environmental value.

For example, not only have oil and gas revenues historically ranked second only to the Federal Income Tax as a revenue source for the Federal Government, but at the same time the Gulf provides critical habitat for 75% of the migratory waterfowl traversing the United States.

We waited until it was almost too late to clean up the Great Lakes and the Chesapeake Bay, are we going to do the same to the Gulf of Mexico?

Are we going to wait until we can no longer fish the Gulf, until Americans can no longer eat good shrimp, to begin comprehensively addressing its problems?

If we do, clean up efforts will end up costing 7 times that of the Great Lakes, and 200 times that of the Chesapeake Bay.

Let me assure you that delay will only compound the problems and the costs of restoring the Gulf to the living jewel that it is.

I applaud the actions of my colleagues from the Great Lakes, the Chesapeake, and other regions for their aggressive and continuous efforts to protect and enhance those national treasures.

Now is the time for us to do our part for the region that contributes so much to our Nation's economy and environment.

In closing, I would like to thank the other co-chair of the Gulf Task-Force, my distinguished colleague and friend Sonny Callahan and all of the other members of the Gulf of Mexico Task Force who have worked so hard in developing this legislation.

Thank you.

STATEMENT OF THE AMERICAN AUTOMOBILE MANUFACTURERS ASSOCIATION

The American Automobile Manufacturers Association (AAMA) submits this testimony for the record of the August 4, 1993 Clean Water, Fisheries and Wildlife subcommittee hearing on regional issues associated with the reauthorization of the Clean Water Act. AAMA is the trade association for the domestic manufacturers of passenger cars and light trucks. Our members, Chrysler Corporation, Ford Motor Company and General Motors Corporation, manufacture approximately 81 percent of all U.S.-built cars and light trucks, and operate 172 assembly and component manufacturing facilities in the Great Lakes States.

This testimony will highlight some of our key concerns regarding the reauthorization of the Clean Water Act, using examples raised by the proposed Great Lakes Water Quality initiative. This regional approach to water quality improvement was authorized by the Great Lakes Critical Programs Act of 1990 and affects many of our members' manufacturing facilities.

The goal of this initiative is a laudable one: to develop comprehensive water quality guidance for the protection of the Great Lakes System. However, AAMA has two serious concerns with the Great Lakes initiative regulations as they have been developed and proposed. First, the proposed regulations lack technical and scientific validity. Second, the regulations do not accurately reflect the small environmental benefit that will result despite the huge economic impact to businesses and municipalities in the Great Lakes region.

EPA is required by the Clean Water Act to develop and publish water quality-based criteria that "accurately reflects the latest scientific knowledge." Many of the Great Lakes initiative standards, in contrast, are scientifically unsupportable and excessively conservative. As a result, many of the standards are an order of magnitude more stringent than necessary.

Regulation of heavy metals such as copper and zinc is a good example of how the proposed standards are scientifically incorrect and overly stringent. In general, heavy metals must be in a dissolved state or bioavailable in order to pose a threat to aquatic life. Toxicity limits should be established using dissolved metals. Studies have demonstrated that metals limits as proposed by the Great Lakes initiative rule are many times more stringent than necessary to protect aquatic life. Despite conclusive scientific information and acknowledgement by EPA experts that the proposed method of translating water quality criteria into permit limits overestimates bioavailability and toxicity, the proposed rules have not been modified. As a result, the proposed Great Lakes initiative Aquatic Life criteria seeks to address problems that do not, in fact, exist.

We are also concerned that these regulations will impose severe economic burdens with only minimal environmental improvement. This is partly because the Great Lakes initiative addresses only industrial and municipal sewage treatment plants which discharge pollutants through pipes, known as point sources. However, it is well known that these sources are not the major contributors of many of the pollutants in the Great Lakes. EPA's own studies show that nonpoint sources, such as air deposition and agricultural and urban runoff, are more significant contributors. Nonpoint sources contribute more than half of the toxic pollutants discharged into the Great Lakes. The most common nonpoint pollutant comes from soil eroded from farms, construction sites and stream banks. Significant improvements in water quality will only be attained if regulatory controls are directed at the sources causing the greatest problems.

AAMA believes that the goals of the Great Lakes Water Quality Agreement will not be met unless EPA prioritizes and directs its regulatory efforts to control pollutant sources which have the greatest impact on the Great Lakes. The lack of a holistic approach places an undue burden on industry, municipalities and the public to minimize pollution, well beyond what is actually necessary. Improvements of the water quality in the Great Lakes will not be realized unless regulatory efforts address pollutants from nonpoint sources, such as agricultural and urban storm runoff.

In addition to these technical concerns and lack of overall environmental benefits, the economic impacts of these regulations will be staggering and anti-competitive. For example, implementation of the Great Lakes initiative will lead to significantly more stringent permit limitations for many of the pollutants commonly discharged from automotive manufacturing operations. In addition, the proposed anti-degradation requirements such as "the no net increase in pollutant loadings . . .", could deter economic expansion in the Great Lakes Basin. Before any existing facility could be expanded, any additional pollutant loadings would have to be eliminated, even if the resultant discharges would be within permit limitations. This proposed requirement would impose an economic disadvantage to a facility in the Great Lakes Region as compared to a similar facility elsewhere in the nation or overseas.

AAMA's member companies will not only be affected by more restrictive requirements placed upon their discharges to the Great Lakes and its tributaries, but will also be faced with stringent and essentially unachievable requirements mandated by the local municipalities through their pretreatment programs. Even the lowering of permit limitations, as applied to municipal discharges under the proposed Great Lakes initiative, will force municipalities to modify their industrial pretreatment programs by significantly restricting the discharges of many pollutants from industrial sources to levels well below the best achievable technology known. In

some instances, pretreatment requirements on industrial source discharges will be more stringent than limitations applied to the municipality, because of the inability of the municipality to control pollutant contributions from domestic sources.

AAMA members have 124 manufacturing facilities, including 20 assembly and 104 component plants in six states within the Great Lakes Basin (89-MI, 16-OH, 2-IL, 1-IN, 4-WI, 12-NY) that are affected by the proposed rules. This breakdown assumes that only those facilities within the Basin are impacted by the proposed regulations; and that Great Lakes states other than Michigan will have "two" sets of water quality standards (i.e., one adopting Great Lakes initiative requirements for Basin dischargers and the other (less stringent) being applied to the balance of the state). If the other Great Lake states choose to adopt the Great Lakes initiative requirements statewide, 48 additional AAMA member facilities may be impacted. These manufacturing facilities are predominately indirect dischargers to municipalities.

The overly stringent requirements proposed by the rules will force AAMA's member companies to apply advanced treatment technologies, such as a combination of biological treatment, softening, reverse osmosis, high efficiency filtration, carbon absorption and reject water treatment, in addition to existing Categorical Best Available Technology equipment. However, even this treatment technology may not be consistently effective for PCBs and other complex organics.

Facilities that discharge stormwater and non-contact cooling water into the Great Lakes Basin will also be required to provide additional treatment. Depending upon state adoption, application of more stringent metal limitations as proposed by these rules will require the installation of multiple advanced treatment technologies (i.e., a combination of biological, media filtration, softening, reverse osmosis and reject water treatment) to reduce pollutant concentrations in rain water and uncontaminated non-contact cooling water from city water supplies. Industry would be forced to treat rain water and city water that has not been impacted by any plant activity. Thus, when discharging only city water with no plant contribution, treatment will still be required prior to this discharge.

The potential capital cost impact of the proposed Great Lakes initiative upon AAMA's member companies in the Great Lakes Basin is estimated at two billion dollars, with annual operating and maintenance costs approaching two hundred million dollars.

To summarize, a holistic approach which sets priorities based on sound science and implements programs using risk-based controls should be the basis for the environmental objectives of both the Great Lakes initiative and the Clean Water Act Reauthorization. AAMA urges the subcommittee to evaluate the economic and social impact of the Great Lakes initiative and apply the lessons learned as you re-draft the Clean Water Act. As currently proposed, the initiative places an unacceptable burden on industry and municipalities in the Great Lakes Basin. Regrettably, in spite of these high costs, there is little expectation that measurable improvement in Great Lakes water quality will result.

REAUTHORIZATION OF THE CLEAN WATER ACT

THURSDAY, AUGUST 5, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES, AND WILDLIFE,
Washington, DC.

FEDERAL AGENCIES; MONITORING; AND OTHER ISSUES

The subcommittee met, pursuant to recess, at 9:35 a.m. in room 406, Dirksen Senate Office Building, Hon. Bob Graham [chairman of the subcommittee] presiding.

Present: Senators Graham and Chafee.

OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Senator GRAHAM. Good morning. Today we conclude our current series of hearings, which we have held over the past eight weeks on the reauthorization of the Clean Water Act. We will hold at least one additional hearing in September on the specific subject of wetlands.

This morning's hearing focuses on a number of miscellaneous issues which are important to our review of the act but to which we have not yet been able to give our full attention. For this hearing we have invited representatives of the various Federal agencies which are impacted by the Clean Water Act to share with us their comments on the Clean Water Act generally and on S. 1114 specifically.

The areas of responsibility for these agencies vary greatly. The Environmental Protection Agency is the primary Federal agency with responsibility for much of the Clean Water Act. Accordingly, it is no stranger to the witness table this summer; in fact, we began our series on June 16th with the testimony of its Administrator, Ms. Carol Browner. We look forward to continuing our discussions with EPA over changes to the Clean Water Act, one of the agency's premiere environmental responsibilities.

On July 14th and again on July 21st, this subcommittee focused on nonpoint source pollution and watershed planning as a means of addressing nonpoint source pollution. We were repeatedly told that agriculture is a major contributor to this type of pollution. The Department of Agriculture is here today to discuss a number of its programs that address water quality, and will focus today on the nonpoint source pollution and watershed planning provisions of the bill before us.

Two agencies within the Department of the Interior are here to discuss issues relevant to them. The Fish and Wildlife Service is here to continue our inquiry into physical and biological impacts on our Nation's waters. We will recall the testimony at our first hearing in which a panel of scientists warned us that we must remember that the Clean Water Act should not just concentrate on chemical impact. To the extent that it has, we have seen remarkable successes, though much is still left to be done in the area of chemical impact.

We have also been reminded that dams kill fish, and biological changes impact habitat.

The U.S. Geological Survey is here primarily to discuss with us its monitoring program and how it does and does not coordinate with other monitoring programs, such as those at EPA.

Finally, the National Oceanographic and Atmospheric Agency, or NOAA, is here to talk about coastal programs and its monitoring efforts.

We will then turn to three remaining issues in our second panel. The General Accounting Office has prepared for the subcommittee an assessment of several monitoring issues in response to my concerns about whether the environmental data we collect bears adequate relevance to the decisions that agencies must make. That might be a general question that I would like to place before the agency representatives here today: how does the data which is collected by our various monitoring efforts relate to your needs to make policy and management decisions?

We will follow that discussion with a debate about an important but comparatively narrow issue regarding the right of States to control nonchemical impacts on their waters from certain sources.

Finally, we will learn about water conservation efforts, using as an example the city of Tampa and the lessons that perhaps can be applied nationwide from that municipality's experience.

At the first hearing in this series on June 16th I characterized our schedule as "ambitious." This is the seventh hearing in as many weeks. I commend the subcommittee members and the witnesses for their stamina and the contributions that they have made to our understanding of these complex issues. We received a great deal of advice, both oral and written, as to how we should proceed. We will be studying the lessons we have learned in these hearings over the August recess. I invite those who wish to comment on the bill to make their comments known to the subcommittee so that we might take them into account as well.

Again, I thank the witnesses who are here today. I will introduce the witnesses on the first panel by name and title, beginning with Mr. Jim Lyons, Assistant Secretary for Natural Resources and Environment of the U.S. Department of Agriculture; Mr. Douglas K. Hall, Assistant Secretary for Oceans and Atmosphere, U.S. Department of Commerce; Mr. Dallas Peck, Director of the U.S. Geological Survey of the Department of the Interior; Mr. Michael Spear, Assistant Director, Fish and Wildlife Service, Department of the Interior; and Mr. Robert H. Wayland, III, Director, Office of Wetlands, Oceans, and Watersheds of the U.S. Environmental Protection Agency.

Mr. Lyons has another commitment in the House of Representatives which he must leave to attend, so I am going to ask if he would make his presentation first. I will ask a few questions of Mr. Lyons, then if you must move on, it is your loss that you will not get the benefit of the rest of the testimony. You can read the transcript. Then we will proceed to the other witnesses, asking each in turn to make their presentation, and then I will ask questions, as will other members of the subcommittee as they join us.

Mr. Lyons?

STATEMENT OF JAMES R. LYONS, ASSISTANT SECRETARY FOR NATURAL RESOURCES AND ENVIRONMENT, U.S. DEPARTMENT OF AGRICULTURE, ACCOMPANIED BY JOHN BURT, SOIL CONSERVATION SERVICE; AND WILLIAM McCLEESE, U.S. FOREST SERVICE

Mr. LYONS. Thank you very much, Mr. Chairman. I appreciate the committee's indulgence. Congress is rushing to get a lot done in the remainder of this period of work.

I am pleased to be here to discuss the views of the Department of Agriculture on reauthorization of the Clean Water Act. I am accompanied by John Burt with the Soil Conservation Service and Bill McCleese from U.S. Forest Service, who can address any technical questions you might have.

Water quality, of course, is a cross-cutting concern and has the potential of affecting agriculture and USDA programs in numerous ways. But let me make clear, Mr. Chairman, that while agriculture is a significant part of the nonpoint source pollution problem, USDA intends to be an important part of the solution.

The quality of water from a watershed is influenced by the way we farm, harvest timber, graze cattle, or confine livestock for efficient production. USDA can play a significant role in reducing the effects of these activities on water quality, and this is why USDA must be involved in implementation of the Clean Water Act.

S. 1114 helps provide the support and program direction needed to aid in the maintenance and restoration of the quality of the Nation's waters. The watershed approach is the most effective way nonpoint source pollution can be effectively managed. Today I would like to discuss USDA's experience in water quality, both on privately owned lands and on Federal lands.

First, USDA has numerous programs that have had and are having an impact on water quality on privately owned lands. One such program, the conservation compliance provisions of the 1985 and 1990 farm bills, for the first time linked an individual producer's performance on environmental issues to eligibility for USDA farm program benefits. To remain eligible for USDA farm program benefits, conservation compliance requires farmers to develop and carry out approved conservation plans on highly erodible cropland. SCS has worked with farmers to develop more than 1.5 million conservation compliance plans.

When fully implemented, these plans will significantly reduce soil erosion on some 142 million acres on participating farms in the United States. SCS estimates that fully implemented conservation compliance plans, combined with grass and tree plantings on more

than 35 million acres enrolled in the Conservation Reserve Program, will cut the soil erosion rate on highly erodible cropland in the U.S. by about 65 percent. In areas where sediment is the primary problem, conservation compliance will have the effect of improving water quality.

USDA's National Conservation Program in 1988 established protection of water quality from agricultural pollution as a national priority. As a result, agencies began to redirect resources where possible to address water quality concerns. This resulted in a number of outputs:

First, increased research in such areas as developing predictive models;

Evaluating agricultural chemical transport;

Searching for plant species requiring less pesticides and methods for propagating crops with less use of pesticides;

Improved technical assistance to aid farmers and ranchers in dealing with nonpoint source pollution problems;

Education and information materials directed to farmers and ranchers to make them aware of water quality concerns and provide guidance on how to correct water quality problems; and

Financial assistance, to the extent it has been available, to help farmers and ranchers install cost-effective environmental practices and/or try new methods of farming or ranching.

Today we have about 135 water quality projects across the country. At USDA we have used the program resources and authorities of 15 programs to implement water quality planning and implementation. USDA has also reached out to form partnerships with industry, farm organizations, and with other agencies to help implement water quality improvements. And here, Mr. Chairman, I would like to emphasize the fact that we are doing our best to develop partnerships with producer organizations and with producers themselves to work jointly to address nonpoint source pollution concerns.

USDA is also working closely with EPA on many water quality issues and projects related to agriculture. USDA and EPA have jointly funded Soil Conservation Service staff positions for all of the EPA regional and national offices; provided support to the National Estuary Program; and assisted EPA and NOAA in developing technology-based management measures for the Coastal Zone Management Reauthorization Act amendments. EPA also has two persons detailed to our offices in USDA to help work on nonpoint source pollution concerns.

We firmly believe that partnerships with agencies, the agricultural community, State governments, and local people must be continued and improved. Federal and State governments cannot implement water quality improvements without the support of the local people and the agricultural community. This is a key reason for the watershed approach, and it must be fully supported by all Federal and State agencies. We believe USDA plays a critical role there.

Our experience has taught us some valuable lessons which we think are useful to consider.

First, patience is a critical concern in dealing with nonpoint source pollution concerns. It clearly takes time for water resources to respond to reduced nonpoint source loading.

Second, we need to rely on observable results. Monitoring of physical chemical characteristics of water provides important information for determining the impacts on water quality.

Third, on-farm application is clearly essential. When farmers are able to relate their farming activities to water quality concerns—that is, when they understand how what they're doing is impacting on water quality—we find more often than not that they are willing participants in programs to help reduce or alleviate those impacts.

Fourth, always remember that a delivery system which can implement programs at the local level is critical.

Finally, solutions which come from the bottom up rather than the top down seem to work best.

We recognize, Mr. Chairman, that the nonpoint source pollution problem is enormous; in fact, EPA estimates it will cost \$8.8 billion over 20 years to control agricultural and silvicultural nonpoint sources of pollution. However, we believe the watershed approach is a very sound and effective way to accomplish the objectives of the Clean Water Act and to seek to reduce nonpoint source pollution impacts. However, it will require experience in watershed planning and resource management at the local level to facilitate the process and assist in implementation. The Soil Conservation Service and the Forest Service can clearly assist in providing this kind of guidance at the local level.

We recommend three ways to make the watershed concept work for water quality.

First, we think it is clearly important that the USDA be one of the Federal partners involved in implementation. We have the field staff, the experience, and the multidisciplinary technical skills necessary to supplement efforts already occurring in other agencies to implement this approach. We are, in fact, actively applying watershed management across the Nation.

Second, we think it is critical that the program be flexible. Clearly, in dealing with nonpoint source pollution concerns, one size does not fit all. Flexibility in designing programs and plans to aid local producers or to deal with local management situations when it comes to forest lands is critical.

And third, involvement of local people and institutions is also essential.

If I could, Mr. Chairman, just briefly turn to the activities of the Forest Service, the Forest Service is responsible for managing 191 million acres of forest and rangeland in the United States. In addition, the Forest Service's State and Private Forestry Program works closely with private landowners, affecting millions of acres of land in how they are managed.

The Forest Service is actively involved in research, development, and implementation of management practices designed for the control of nonpoint source pollution and the protection of forested watersheds. The Forest Service has developed a watershed management strategy for protection of nonpoint sources based on two basic components: prevention and rehabilitation.

The Forest Service policy is to comply with all State requirements for protection of water quality in the same manner and to the same extent as a nongovernmental entity. In most States we have developed and are implementing working agreements with the States to achieve this end. Under these agreements the Forest Service is responsible for implementing State nonpoint source water quality programs on the National Forests. Through review of proposed Forest Service programs and monitoring activities, the States are assured that Forest Service programs meet State water quality concerns.

Let me briefly summarize, Mr. Chairman, with some comments on S. 1114.

As I said, we are delighted to see that S. 1114 is taking a watershed approach to help implement water quality improvement programs, an approach that is consistent with our philosophy of managing ecosystems on a watershed-by-watershed basis—an approach, I might add, Mr. Chairman, that is the foundation of the President's recently announced plan for management of the forests in the Pacific Northwest, where an interagency effort is now underway to begin the watershed based planning necessary to address the multiple resource concerns that affect that region.

EPA, in consultation with USDA and others, should provide watershed program requirements for the State to follow. At a minimum, a State watershed plan should list the targeted watersheds; identify water quality concerns in the watersheds; specify a schedule for developing a plan; require coordination with appropriate Federal agencies, including the land management agencies; and identify Federal and State assistance through existing programs.

At USDA we support the farm bill incentive programs and other measures in the 1985 and 1990 acts to help address nonpoint source pollution concerns. In general, USDA is not opposed to a requirement that Federal lands be managed in a manner that is consistent with that required on private lands; in fact, that's exactly what the Forest Service does.

Finally, as I've indicated, USDA supports the emphasis on watershed management as the key to resolving the nonpoint source pollution problems ahead. This is consistent with the direction that the Forest Service and SCS are taking. We think it is a critical direction to address the concerns that we all share.

Thank you very much, Mr. Chairman, for this opportunity to appear before the committee.

Senator GRAHAM. Thank you very much, Mr. Lyons.

As I stated earlier, I am going to ask a few questions of you now, and then we'll move on to the other members of the panel.

You mentioned some of the successes in nonpoint pollution planning, both in the department and in the Division of Forestry. If you were going to go out across the country and look at the best examples of nonpoint source pollution in an agricultural or forestry setting, where would you go? What's the state of the art in nonpoint source pollution control?

Mr. LYONS. I'm afraid I'd be short on specific places to point to. That's one of the things I'm trying to do right now, Senator, is get out and look at our successes and, frankly, look at some of our failures. But I think some of the programs that have been implement-

ed in the midwest, in Iowa in particular, offer some good examples of how working cooperatively with landowners in implementing both the requirements of the 1990 Farm Act with regard to conservation compliance, and using some of the other tools that we have, such as the Conservation Reserve Program to set aside fragile lands, looking down the road to the hope of being able to implement the Wetland Reserve Program which is another mechanism we think can help in addressing these concerns—I think you would see that we are making significant progress in working with landowners to achieve these goals.

Senator GRAHAM. Mr. Lyons, for you and other members of the panel, there may be some follow-up questions on which we would appreciate your response in writing.

I would be interested in some specific addresses of places that we might look at. I have found it helpful in discussing intangible concepts like this to go to the benchmark of where the best practice is actually being implemented in order to convert concept into reality. I would appreciate your recommendations on where your travel agenda would take you, if that's what you wanted to do.

Mr. LYONS. I will be glad to send you a summary of what we have ongoing now, Mr. Chairman, and if appropriate, invite you to come out and join me. We will look at some of these sites.

Senator GRAHAM. Good.

I mentioned that we're going to be talking later with the second panel about some monitoring data and about how adequate and decision-oriented that data is. From your perspective could you comment on the data that is available to the Department of Agriculture to carry out its responsibility?

Mr. LYONS. I would say generally, Mr. Chairman, that we clearly would like to see some improvements in the monitoring data. It makes it very difficult to target programs, to make efficient use of existing funds without solid data on the status of nonpoint source pollution concerns.

I could yield to my colleagues from SCS and Forest Service to talk about the specifics, but let me offer one example.

I think we have found, for example, in implementation of the land management plans of the Forest Service that one of the areas that is clearly lacking is investments in monitoring. Each of the National Forest plans which address, in many respects, water quality concerns, have provisions and has a plan for monitoring; however, we have had a great deal of difficulty in the past in obtaining the funds to implement that kind of monitoring activity.

As I mentioned, in the Pacific Northwest where the President has provided direction for implementation of a new regionwide forest plan, one of the key elements is the development through an interagency task force of the protocols for monitoring impacts of forest management activities on water quality.

Senator GRAHAM. In your statement in a few places you made some positive observations that the programs seem to be having the intended result of improving water quality. How effective is our current data in, first, establishing a baseline of what is the reality of the current state of water, particularly as affected by non-point source pollution from an agricultural source; and second,

after we have implemented our control measures, what effects they have had?

Mr. LYONS. I would say, Mr. Chairman, that our baseline data are not very good. That's a concern. We have been forced to use biological indicators as a measure of performance and a determinant of what we have been able to achieve.

Having good, solid baseline data would help us tremendously in understanding both the impacts of agricultural production as well as those of silvicultural activities. Again, this is one of the things we're looking at in trying to apply this ecosystem strategy in the Pacific Northwest, to determine what those baseline characteristics ought to be as a measure of performance.

Senator GRAHAM. Is there anything that you would suggest—either today, or if you would like to do this subsequently—on what we could do within the Clean Water Act reauthorization in order to give greater attention to monitoring, data collection, the ability to make improved decisions based on management and decision-oriented data?

Mr. LYONS. Well, I'll get back to you with more specifics, Mr. Chairman.

I would say most immediately that in establishing protocols for developing that baseline data, I think a critical element is that the data be developed in a coordinated, interagency fashion, so that whatever database is established to monitor clean water concerns also recognizes some of the other data needs that we have. That way we don't run into a situation where one agency perhaps develops the baseline data for water quality, but it has less utility for some of the activities of, say, the Forest Service and SCS and Fish and Wildlife Service and other agencies.

That approach, a coordinated and consistent approach that allows us all to agree on what the baseline data should be, would do a great deal to help us achieve not only our water quality objectives but some of the other management objectives that we all seek to achieve. So I would offer that concern and that plea, that when we put this together, we do it jointly and that it address multiple concerns in addition to the immediate nonpoint source pollution concerns that we have.

Senator GRAHAM. I would like to submit that question to each of you that you might be prepared to comment on what we can do within the Clean Water Act itself in order to facilitate the objectives that Mr. Lyons has just described.

Mr. Lyons, I know you have to leave at 10:00 o'clock, so we have a couple minutes. Let me ask two questions.

What tactics has the Department of Agriculture employed, from best management practices to land acquisition to wetlands reserve programs, etc.—what have you found to be the most cost-effective and sustainable solutions to nonpoint source pollution in an agricultural setting?

Mr. LYONS. Mr. Chairman, I was saying that it depends on what watershed you're in and what your pollution prevention objectives are. I was going to say that I think the most effective tool we've found is working with farmers and providing them the technical assistance and information necessary for them to understand precisely what impact they're having on water quality.

We have a fairly good-sized toolbox to choose from in terms of the management activities that we seek to put on the ground, and we have a very important stick in conservation compliance. That certainly gets the attention of producers, but I think we've found that, again, producers who have come to understand how their activities may be impacting on water quality are more likely to seek assistance. Where additional financial incentives or cost-share assistance might be available, we are able to get practices in place on the ground. But I think having a big toolkit, if you will, is essential so that we can perhaps, for a given landowner, offer technical assistance to, say, change cropping practices to reduce impacts on nonpoint source pollution, but in areas where we have a significant problem, be able to offer a set aside program like the Conservation Reserve Program or a long-term easement program like the Wetland Reserve Program.

Having that capability and being able to go out on the ground with landowners and tailor a plan to address their particular pollution concerns is critical and I think probably the most cost-effective mechanism we have.

Senator GRAHAM. Mr. Lyons, I appreciate your testimony today. I wish you well in the House of Representatives. We'll be back in touch with you on some of those questions and maybe we'll have a chance to visit the places that you would designate as state of the art.

Mr. LYONS. I look forward to that. Thank you again, Mr. Chairman.

Senator GRAHAM. Great. Thank you, sir.

Mr. Hall?

STATEMENT OF DOUGLAS K. HALL, ASSISTANT SECRETARY FOR OCEANS AND ATMOSPHERE, U.S. DEPARTMENT OF COMMERCE

Mr. HALL. Thank you, Mr. Chairman.

I am glad to be here today to discuss the role of NOAA in meeting the challenge of restoring the quality of our Nation's waters. Senators Baucus and Chafee have introduced a reauthorization package that provides a new framework within the Clean Water Act, and NOAA strongly endorses this restatement of goals and strategies, to include protecting and restoring ecosystem health.

With this emphasis, NOAA's scientific capabilities and technical expertise become even more relevant to the Clean Water Act and more significant in meeting the water quality goals of the Nation. This shift to a comprehensive and integrated perspective will enable us to focus on cumulative, systemic causes of environmental decline rather than individual impacts. Focusing management, planning, research, and monitoring on entire watersheds is particularly critical for the coastal and marine ecosystems under NOAA's stewardship. I will focus on four major themes in the proposed legislation that highlight NOAA's role in protecting the health of the coastal ecosystems. These include the watershed management approach, regional partnerships, stronger controls on nonpoint source pollution, and the need for research and monitoring.

NOAA strongly supports the addition of a new section to the Clean Water Act to encourage comprehensive watershed manage-

ment. NOAA is acutely aware of the effects of poor watershed planning and management, sometimes occurring tens or hundreds of miles inland, on the coastal and nearshore resources, of which we are stewards. We believe that continuing loss and degradation of habitat is the greatest long-term threat to the viability of commercial and recreational fisheries, the protection of marine mammals and endangered marine species and the preservation of our coastal zone and special protected areas.

A new strategy based on protecting and restoring living resources that includes full upstream watershed planning and management, as well as downstream ecosystem management, planning, research and monitoring is needed to turn the tide on coastal degradation and deal with environmental problems before they become environmental crises. Under several existing programs and authorities, NOAA is incorporating the principles of watershed protection in the management of marine resources.

The Clean Water Act has fostered many regional programs directly related to NOAA's trust and stewardship responsibility for fishery habitat and coastal zone management. NOAA participates in Federal-State partnerships coordinated by the Environmental Protection Agency, in particular the 21 National Estuary Programs and the three Great Waters Programs, the Chesapeake Bay, the Gulf of Mexico, and the Great Lakes. While EPA's strength lies in its water quality protection authorities, NOAA's strength lies in its coastal zone, habitat, sanctuary and reserve, fishery management, research, and monitoring responsibilities.

The partnership approach in the National Estuary Program and the Great Waters Program builds on each agency's strengths to create truly comprehensive action plans. This partnership is evident in NOAA's establishment of a Chesapeake Bay Office to enhance our contributions to efforts on cleanup and restoration of the Bay. In Florida, NOAA is developing an overall ecosystem management plan for the Florida Keys National Marine Sanctuary in cooperation with the State of Florida, EPA, the Interior Department, other Government agencies, commercial fishermen, environmentalists, recreational user groups, and the public. EPA, which is responsible for the water quality protection component of the plan, could be aided by components of S. 1114.

NOAA is committed to participating in these ecosystem-based restoration and protection programs. These types of regionally based cooperative efforts, organized around a specific watershed, will be at the forefront of environmental issues in this country and should be an extension of the watershed management approach proposed in S. 1114.

With regards to nonpoint source pollution, NOAA believes that tackling the problems of nonpoint source pollution provides the greatest opportunity we have to impact profoundly this Nation's coastal environment in the next century. We strongly support strengthening the existing section 319 programs under the Clean Water Act. Given the work today on coastal nonpoint programs under section 6217 of the Coastal Zone Management Act Reauthorization Amendments of 1990, we believe that it is very important that amendments to section 319 of the Clean Water Act be compatible with and enhance these programs. Consistency between the

State coastal nonpoint programs and the State section 319 programs will undoubtedly bolster both efforts.

We are now six months into the thirty-month statutory time-frame for States to develop and submit their coastal nonpoint programs, and we are finding general support for the goals of section 6217. We consider the improved dialog and coordination between coastal management and water quality agencies at the State level, as well as the Federal level between NOAA and EPA, to be one of the early successes of this program.

We would like to see this coordination continue and be strengthened through amendments to section 319. Increasing national attention on nonpoint source pollution will support the efforts already underway by the coastal States.

On research and monitoring, NOAA believes that any new legislation outlining management, watershed, and ecosystem perspectives must include appropriate monitoring and research, and we appreciate the Chairman's leadership in this area. We must be able to define, detect, and understand ecosystem health criteria in order to identify real risks, track progress, or adapt management strategies along the way. Each of these are essential ingredients to economically sound and environmentally effective management. This is a very large task, and its undertaking clearly exceeds the limits of resources and expertise of any single agency.

The goals of the Clean Water Act could be met more quickly and efficiently by ensuring that Clean Water Act—related monitoring and research data, information, and expertise from all Federal agencies are coordinated and used, where appropriate. There are many opportunities for NOAA's research capabilities to support the broadened goals of the Clean Water Act. NOAA and its academic partners conduct interdisciplinary research programs in virtually all aspects of environmental quality and coastal ecosystem health.

NOAA's existing capabilities for monitoring the marine environment also offer a considerable opportunity for supporting Clean Water Act goals. The National Coastal Monitoring Act of 1992, which mandates the development of a national Federal and State monitoring program to assess the status of coastal ecosystems of the United States, has expanded NOAA's historic responsibilities. NOAA and EPA are currently developing a joint strategy for carrying out the responsibilities mandated by the act.

NOAA believes that there clearly should be a mechanism to coordinate Clean Water Act-related research efforts across the environmental agencies. We recommend the use of existing interagency mechanisms, such as the Intergovernmental Task Force on Water Quality Monitoring and the Coastal, Ocean, and Water Resources Subcommittees of the Federal Coordinating Council on Science, Engineering and Technology.

In conclusion, we strongly support redirecting the Clean Water Act to better protect ecological resources by emphasizing biological criteria for decisionmaking. The watershed approach will assist NOAA greatly in our efforts to protect fisheries and other marine resources from the impacts of development and watershed draining in the coastal waters. Consistency between Clean Water Act nonpoint source pollution requirements and those contained in section

6217 of the Coastal Zone Act Amendments will strengthen the efforts already underway in the coastal States.

NOAA offers strong capabilities in research and monitoring of marine, coastal, and Great Lakes environments, a critical component of ecosystem protection and restoration.

Thank you, Mr. Chairman. I will be glad to answer any questions.

Senator GRAHAM. Thank you, Mr. Hall.

Mr. Peck?

STATEMENT OF DALLAS PECK, DIRECTOR, U.S. GEOLOGICAL SURVEY, U.S. DEPARTMENT OF THE INTERIOR, ACCOMPANIED BY PHILLIP COHEN, CHIEF HYDROLOGIST AND CHIEF, WATER RESOURCES DIVISION

Mr. PECK. Thank you, Mr. Chairman. It is a privilege for me to appear before you today as you consider the issues of watershed management and monitoring. I am accompanied by Mr. Phillip Cohen, who is sitting right behind me. He is the Chief Hydrologist of the U.S. Geological Survey's Resources Division.

My testimony today will emphasize those aspects of the U.S. Geological Survey's programs that most directly pertain to the objectives of coordination, monitoring, and assessment. I have included a more complete description of our activities in my remarks for the record, and will only summarize them today.

Some of the difficulties in using available information to describe the Nation's water quality conditions include the differences between agency procedures; the tendency to carry out measurements where problems are suspected; and the small number of sites with long records of constituents of recent concern. Even so, we believe that improved Federal, State, and local monitoring efforts, together with our new national assessment programs of the USGS and other Federal agencies, will provide the support needed to achieve the objectives of the Clean Water Act, as well as other statutes.

Turning to the matter of coordinating Federal, State, and local monitoring activities, water data collection responsibilities are dispersed at all levels of Government and the private sector. The successful establishment of improved coordination and cooperation promises to improve greatly the availability of reliable monitoring information and water quality assessments.

The Office of Management and Budget, recognizing the need to improve the coordination of water information programs, established the Water Information Coordination Program in December, 1991, under OMB Memorandum M-92-01 (See Attachment 1). The U.S. Geological Survey, through the Department of the Interior, is responsible for implementing this program. This program builds on over 25 years of experience coordinating water data under OMB Circular A-67.

In January, 1992, the Water Information Coordination Program established the Intergovernmental Task Force on Monitoring Water Quality, chaired by Elizabeth Jester Fellows of EPA, to evaluate water quality monitoring activities in the U.S. and to recommend improvements. The report to OMB on the first-year's activities of the task force outlines a proposal to carry out a national

strategy to enhance water quality activities and to better support management decisions.

USGS and EPA are working closely together to support the Intergovernmental Task Force with outstanding cooperation from others, such as NOAA and the U.S. Department of Agriculture. I am confident that the task force and resulting activities will improve the effectiveness of our monitoring and assessment programs across the board. A very important aspect of improving programs involves working with State and local agencies, as well as the Federal Government.

With regard to monitoring, the USGS has been actively engaged in assessing and monitoring the Nation's water resources for many years. For example, our stream-gaging network began operation over 100 years ago, and ground water, surface water, and precipitation data are now collected on a routine basis at over 45,000 sites across the Nation. Water resource managers at all levels of Government rely heavily on the information from these sites.

Two USGS programs have major status- and trend-monitoring components that directly or indirectly support Clean Water Act objectives. The Federal-State Cooperative Program has been in operation for over 100 years. This 50/50 jointly funded program is a unique partnership between the USGS and 1,000 State, regional, and local government agencies to enhance water resources information nationwide. The goals of the program are to collect data and develop information, and to use that data and information to appraise the availability, distribution, and characteristics of water resources.

The National Water Quality Assessment (NAWQA) program is describing the status and trends in national water quality and is identifying the factors affecting water quality. NAWQA provides specific water quality information to those individuals who set policy, write regulations, establish priorities, or manage water resources. To meet its goal, the program will integrate water quality information on a regional, local, and national scale. We start one of the NAWQA areas in south Florida this fall.

We expect that these USGS monitoring and assessment activities will contribute to the Nation's ability to evaluate the extent to which programs undertaken pursuant to the Clean Water Act are helping us to achieve a better environment.

That concludes my formal testimony, Mr. Chairman. I would be happy to respond to any questions you may have.

Senator GRAHAM. Thank you very much, Mr. Peck. We will have some questions at the conclusion of the panel.

Mr. Spear?

STATEMENT OF MICHAEL SPEAR, ASSISTANT DIRECTOR, FISH AND WILDLIFE SERVICE, U.S. DEPARTMENT OF THE INTERIOR, ACCOMPANIED BY DAVID DENSMORE, ECOLOGICAL SERVICES; AND TIM KUBIAK, ECOLOGICAL SERVICES

Mr. SPEAR. Thank you, Mr. Chairman. I appreciate this opportunity to appear before you regarding the role of the Fish and Wildlife Service in the Clean Water Act. I am accompanied by Dave Densmore and Tim Kubiak of our Ecological Services staff.

The Service's interest in the Clean Water Act stems from our stewardship responsibilities for endangered species, migratory birds, anadromous fish, and several marine mammals, all of which depend on clean water to survive. The Service also has trust responsibilities for over 90 million acres of lands in the National Wildlife Refuge System. Clean water is essential to maintaining these refuges, as well as to operate our system of national fish hatcheries.

The Service has several authorities for direct involvement in the Clean Water Act activities, including the Fish and Wildlife Coordination Act, the Endangered Species Act, and the National Environmental Policy Act.

The Service has also developed wide expertise in the evaluation of man's effects on living natural resources. This expertise lies not only in our research program, but in our network of over 700 field stations throughout the country. We believe that our authorities, in conjunction with our field experience, can enhance effective implementation of the law.

Since it was first passed in 1972, the Clean Water Act and its subsequent amendments have resulted in substantial improvements in the quality of the Nation's waters and a reduction in the rate of loss of our Nation's wetlands. We believe that the programs established in the Act are sound, but as with any program, they can be improved.

The goals of the Clean Water Act are to restore and maintain the chemical, physical, and biological integrity of the Nation's waters. In the past, implementation of the Act has focused on the chemical integrity of those waters, with less effort on biological and physical integrity. This focus is changing, and we are ready to assist EPA and others by providing technical assistance and consultation on biological resource issues.

At present, 97 of the 775 species of freshwater fish native to the United States are listed as endangered or threatened, along with 63 mussel species, 12 crustaceans, and 11 amphibians. Clearly, if the status of these species is an indicator, the biological diversity of our Nation's aquatic systems is still being threatened. It makes sense, both ecologically and economically, for a society to make every effort to prevent species from reaching such desperate status as to require listing as threatened or endangered. As Secretary Babbitt has frequently noted, managing an entire ecosystem for harmonious development is far more prudent than having to undertake drastic measures to save an endangered species that will undoubtedly have serious economic impacts on those living in that ecosystem.

One means to present this is by protecting wetlands. Many freshwater, anadromous, and estuarine fish species, more than 50 percent of North America's migratory birds, and more than one-third of all threatened and endangered species are dependent on wetlands.

Another means is through development of water quality criteria and standards that reflect needs of aquatic resources.

The Service's biological expertise can be used to enhance implementation of the wetlands provision of the Act and the development of Federal water quality criteria and State water quality

standards. With early coordination, problems can be identified before they reach a level too difficult to resolve. For instance, seeking better water quality standards—and thus better section 402 permits—is more effective than dealing with contaminated sediments after the discharges have ceased.

Preventing further degradation of the waters of the United States through more effective implementation of antidegradation policies and through protection and expansion of our outstanding natural resource waters are also important to meeting the goals of the Clean Water Act.

The Service has been involved in numerous watershed restoration efforts around the country, such as the Great Lakes lake trout restoration and watershed restoration activities on the Clinch River. We can lend our experience and expertise in any watershed or river basin planning activities that may be established in the future.

The Service is obtaining data on the health of trust resources across the Nation. Let me share an example of our effort.

Our ongoing investigations in the Great Lakes watershed have confirmed that certain contaminants continue to threaten colonial waterbirds, as well as bald eagles, with reproductive problems, including deformities. This spring, while monitoring eagle reproductive success, our field personnel located three nestling eagles with beak defects common to colonial water birds nesting in the Great Lakes.

I have brought a photograph of one of these eaglets, showing its deformed beak.

Senator GRAHAM. Where was that picture taken?

Mr. SPEAR. This might have been taken in a lab, but the eagle came from Lake Erie.

I have brought a photograph of one of these eaglets, showing its deformed beak. These young birds have been collected and are undergoing further evaluations. We found that adult eagles which feed on Great Lakes prey have lower reproductive success than eagles feeding on inland lakes and rivers. Eagles nesting along the Great Lakes continue to have significantly higher levels of several contaminants, as measured in their blood and egg samples, than inland eagles.

Our National Wildlife Refuges are being directly impacted by water quality programs. At Salton Sea National Wildlife Refuge in California, based on surveys in 1992, an estimated 150,000 eared grebes died by April of that year, about 8 percent of the North American population. Contaminant analyses of eared grebes indicated elevated levels of selenium, mercury, DDE, and chromium in eared grebe livers, when compared to previous samples from the Salton Sea. Selenium has increased over 200 percent in three years. Endangered species that may be at risk include the Yuma clapper rail, the California brown pelican, the desert pupfish, and the peregrine falcon.

Prior to the 1970's, the average annual loss of wetlands was approximately 450,000 acres. Between the mid-1970's and mid-1980's this loss rate was reduced to approximately 290,000 acres per year. Although there is no question that enactment of section 404 of the Clean Water Act—and more recently, the Swampbuster provisions

of the Farm Bill—have contributed to the positive trend, wetlands destruction continues at a high rate.

I would like to provide one more example of how wetland habitat losses, like other Clean Water Act-related issues, have affected species populations.

California's vernal pool wetlands have sustained a significant and continuing loss from agricultural conversion, flood control activities, and residential and commercial development activities, much of which is currently being authorized through nationwide general permits. As a result, recent estimates indicate that 99 percent of the original vernal pool habitat in the Central Valley has been lost.

As a consequence of these losses, the abundance and diversity of plant and animal species has declined. Currently, ten vernal pool plant species are listed as endangered, while 55 species are designated as candidates for possible Federal listing.

Since its inception, the section 404 regulatory program has substantially reduced the harm to wetlands and other aquatic habitats due to development activities. Nevertheless, losses to fish and wildlife resources continue in spite of the program. We must take a broader view of what is needed to meet the goals of the act and recognize that wetlands protection must always be a part of this approach.

I thank you and the committee for providing this opportunity for discussion of the future direction of the Clean Water Act. Our field force in the Fish and Wildlife Service stands ready to provide technical assistance and consultative service to EPA and the States in meeting our Federal trust resource responsibilities.

Senator GRAHAM. Thank you very much, Mr. Spear.
Mr. Wayland?

STATEMENT OF ROBERT H. WAYLAND, III, DIRECTOR, OFFICE OF WETLANDS, OCEANS, AND WATERSHEDS, U.S. ENVIRONMENTAL PROTECTION AGENCY

Mr. WAYLAND. Good morning, Senator Graham. EPA is delighted to be here again this morning, having participated in several of the earlier hearings. My task today is to focus particularly on monitoring and Federal agency cooperation.

Each of these is extremely important to realizing the ambitious goals of the Clean Water Act. Each will strengthen, and in turn be strengthened by, the watershed management philosophy advanced in S. 1114, advocated by Carol Browner in her initial testimony before you and endorsed by witness after witness over the past eight weeks.

Although we weren't able to present our detailed testimony on watershed management due to the large number of witnesses you needed to accommodate, I hope very much you will have an opportunity to review that EPA statement, which has now been submitted to the committee.

Monitoring is critical to how well we manage our programs and how we measure progress toward our strategic goals. It is our continual feedback loop, vital at all scales, national, State, tribal, local, watershed, and site-specific. We monitor for a variety of purposes,

and our programs must meet several different purposes which call for different monitoring designs. These include identifying and evaluating status and trends of our environment; diagnostic and problem identification-oriented monitoring, such as is conducted in the first phases of our National Estuary Program, or even on a site-specific scale in effluent toxicity testing associated with individual dischargers; evaluating program or project effectiveness, and emergency response.

Many agencies, public and private monitor; but we need to work closely with them to pool our water resource information and make the best use of our limited public and private resources.

The mechanism that we are using to try to accomplish that coordination, which Dallas Peck alluded to earlier, is the ITFM, which we co-founded with USGS, which we chair and on which USGS serves as vice-chair and provides the executive secretariat function. Ten agencies participate in ITFM, as do ten State and tribal governments.

Senator GRAHAM. Excuse me, Mr. Wayland. I would like to impose a rule, and that is that when an acronym is used the first time, it is stated in full, and after that it can be used in its shortened form. ITFM is—

Mr. WAYLAND. Yes. As Dr. Peck said in his statement, it's the Interagency Federal Task Force on Water Quality Monitoring.

Senator GRAHAM. Everyone is expected to remember that.
[Laughter.]

Mr. WAYLAND. I will certainly heed that advice.

As I said, ten agency representatives and ten State and tribal governments serve on the committee. It is in turn supported by a public advisory committee. It has subgroups on institutional collaboration; indicators; field and laboratory methods; information management and sharing, as well as assessment and reporting.

In the Clean Water Act context, strong State monitoring programs are crucial to us. States do much of the monitoring on which we rely, and about 15 percent of their Clean Water Act program support grants—the so-called 106 grants—are devoted to monitoring. Precisely half of the membership of our monitoring coordination effort is provided by States, and we are working with them as well on a consistency work group to try to make their data and reporting more comparable, as required under section 305(b) of the Clean Water Act. Twenty-one States and seven Federal agencies are represented on this work group.

Moreover, we are working with the States more generally on monitoring guidance to help ensure minimum State monitoring program elements.

Our monitoring supports the strategic directions that we're establishing. We are ensuring that our strategic plan has goals which can be evaluated through monitoring data and other assessment techniques, and we are working closely with our partners and other Federal agencies to draw upon information that they collect and manage to evaluate our progress.

"Monitoring program" is really a short phrase for a continuum of linked activities from sample collection with appropriate methods, to lab analysis, data storage and analysis, quality assurance, and quality control, all of which needs to be conducted in an appro-

priate way to support the actions of decisionmakers. The specific actions that we have underway at present are the development of methods, protocols, and guidance, most particularly for biological assessment of streams. We are working on one for lakes and estuaries. We are moving toward the use of more sophisticated data techniques, such as geographic information systems and remote sensing, including the recent commitment to purchase by the end of this fiscal year of LANDSAT thematic satellite mapping information, which is an effort that we have underway with the other agencies represented here at the table.

We are also involved in a broader EPA-wide environmental monitoring management council which works to make comparable the different monitoring methods of different programs so that we can share data more easily among programs.

We are engaged as well in an EPA-wide effort to develop a strategic plan for information resource management, data storage and retrieval. The STORET, which is short for storage and retrieval system, modernization effort which we have underway is intended to take the largest water quality database in the country into the 20th century. At present this system allows us to manipulate some 290 million data points.

We issue a biennial report to Congress, the 305(b) report, as I have mentioned, the only report that describes how well the Nation is meeting its water quality standards and goals. We are working with the States to try to make sure that these data are reported in a more consistent and comparable fashion.

We also support volunteer monitoring very strongly, citizen monitoring. It has two very important values. It helps inculcate a sense of stewardship on the part of the participants and educates them about the importance of water quality and the impact of their actions on water quality, and it can provide useful data, if properly quality-assured.

The foregoing illustrates the mutual dependence and enhanced degree of cooperation among agencies. Fiscal realities and environmental imperatives are breaking down historical barriers. I can say that in my 20 years at the Environmental Protection Agency I have never seen the level of cooperation that we are now enjoying with our partner agencies.

We can also point to this kind of cooperation in areas in addition to the monitoring area, some of which have been touched on by earlier witnesses, in the policy and program development and program implementation areas. To mention a few of these briefly, Mr. Hall was with me, as was Phil Cohen, Dallas Peck's colleague, at the meeting in south Florida recently which you gave a generous amount of time to, to discuss how we can more effectively protect an entire ecosystem. Several of us are engaged in a Coastal America partnership to try to realize protection and restoration of vital coastal resources. The Pacific Northwest Forest Plan has been mentioned, as has the cooperative EPA-NOAA-USGS efforts to implement the Coastal Zone Act Reauthorization Amendments and bring about a more robust nonpoint source pollution program for our coastal areas.

I could enumerate many others but I see that the red light is on, so let me just say that in all of these endeavors we are seeking to

establish—and we are proving to ourselves—that our combined authorities, expertise, and institutional strengths can create a whole that is greater than the sum of its parts, and increase the return on limited Federal resources. We welcome the added impetus that S. 1114 provides to these endeavors.

Thank you.

Senator GRAHAM. Thank you very much. This has been a very instructive panel and I appreciate the obvious effort that each of you committed to the statements that you have delivered today. I will make a couple of other comments, as I said to Mr. Lyons; there may be written questions from other members of the subcommittee, as well as from me. I would appreciate your response to those.

Let me start with the same question I asked Mr. Lyons. In the areas of responsibility of each of you, if you were going to direct someone to what you think is the state of the art, the benchmark of effective programs, where would you send them? For instance, Mr. Peck, in terms of the Geological Survey, what place in the country would you say you would be the proudest of in terms of the information that you have gathered and the utilization of that information for enhanced decisionmaking?

Mr. PECK. There are a couple of recent basins that we have studied under the National Water Quality Assessment Program, NAWAQ. We have conducted several pilot projects; one of those was the Yakima Basin, where we worked very closely with—

Senator GRAHAM. Yakima, Washington?

Mr. PECK. Yakima, Washington.

—with the EPA, the State EFA, the Indian tribes, the State health agency, and with others. We found that elevated levels of DDT and its metabolites in the water were a problem, even though DDT was outlawed 20 years ago. It turns out that DDT was remaining in the soil under the orchards, washing into the stream, polluting the stream, contaminating fish, and ending up in eagles and other birds.

Working with the State agencies, one can come up with plans to decrease the erosion from the old fields, and hence decreases the levels of DDT. Furthermore, the State health agencies issued warnings for eating fish, so there was an immediate practical effect. We have a nice, popular publication on the Yakima DDT problem.

Senator GRAHAM. I would appreciate if you would submit it. We might include it in the record of this hearing.

Mr. PECK. It's short and it is popular.

[The publication referred to has been received and is retained in Committee files.]

Mr. PECK. We also concluded a study of the Delmarva Peninsula, where the issue is nitrates and pesticides related to the poultry culture and farming. And we analyzed the movement of nitrates and pesticides through the groundwater into the streams, and the effect of that movement on rules and regulations used to decrease pollution into streams. We also worked very closely with the Economic Research Service of the U.S. Department of Agriculture; they would gather detailed pesticide data on farms, and then we would analyze the groundwater pollution related to that pesticide.

So again, there is a nice, popular publication, short, that I would like to introduce for the record that explains the findings from that study.

[The publication referred to has been retained in Committee files.]

Mr. PECK. I think we can anticipate through our National Water Quality Assessment Program a number of specific findings that will be important nationally, as far as pesticide regulation, and also important locally as far as solving immediate problems.

Senator GRAHAM. Good. Mr. Peck, we look forward to including both of those reports in the record of this hearing.

Any other members of the panel who would like to suggest—I am asking this question, in part, in terms of planning some activities for this subcommittee later in the year. We would like to visit some of the areas that would give us a hands-on example of what might be accomplished for the rest of the country if all can achieve what the best have achieved.

Mr. PECK. Could I make a suggestion? The Department of Agriculture, through the Agricultural Research Service, has a series of pilot projects. They are called MSEAs, and I apologize, I can't for the life of me remember what MSEA stands for.

Senator GRAHAM. Then under our previously stated rule, you are prohibited from using that acronym.

[Laughter.]

Senator GRAHAM. They call it Management System Evaluation Area.

Mr. PECK. That's what it is.

Anyway, they are farm-sized plots where the Agricultural Research Service, in cooperation with us and a number of other local and national agencies, carry out a number of different kinds of farming practices. They plant the rows close together or far apart, or they put a little bit of pesticide or a lot of pesticide, and then we monitor the water quality of the runoff. So it is a good experiment to determine the practical effect of water quality management practices.

Another neat area where we're working very closely with the Department of Agriculture is near Deep Springs, Iowa; it's in the very northeast corner of Iowa. It's a Karst terrain with a very deep spring—well, actually it stands kind of high, so maybe it's above the flood. But it's a good example where agriculture is doing a lot of things to avoid erosion and trying different application rates of agricultural chemicals, but you can sample effects on the water quality in the springs themselves; thus, you can monitor what's going into the groundwater from your agricultural practices, how much nitrate, how much atrazine, and so on and so forth. So that's another good practice.

Senator GRAHAM. Thank you.

Mr. Hall?

Mr. HALL. Senator, it may be a couple of years, after you go to all the places that Mr. Peck has referred to, but if you have any time left after that, we have a couple of suggestions, too.

One would be Monterey Bay, which is really a model of cooperation between the Federal Government, the State government, and nonprofits, and I think the private sector plays a major role there

in protecting that watershed. We have a marine sanctuary through NOAA's program, through the National Ocean Service. I think that would be a good place to go.

Another would be North Carolina, which has a particularly strong nonpoint source pollution program. I think that they could be a model for the rest of the country in the way they deal with these programs.

Senator GRAHAM. Yes. At one of our recent hearings we had a representative of the State of North Carolina testify on what they had done. It is a very impressive record and, I think, an example and model for other States and communities.

Mr. HALL. Just one other thing that you might want to look at in terms of monitoring, which you have a lot of interest in, would be the Chesapeake Bay, where we have been using remote sensing data through LANDSAT. That is really a prototype in terms of examining land use there in that watershed, and using that to have a direct impact on the management decisions being made in that watershed.

Senator GRAHAM. In a moment I want to return to that question of satellite utilization as part of the monitoring effort.

Any other recommendations for our travel plans?

Mr. WAYLAND. Mr. Chairman, my prepared statement referred to the Upper Arkansas River Watershed Initiative in Colorado, which we think would offer some interesting insights into the problems associated with abandoned mines and creative partnerships developed to address those among agencies here, as well as the private sector.

We also suggested that the Canaan Valley Watershed would be another useful site for a field trip, a very unusual ecosystem with some unusual types of nonpoint source pollution, including sedimentation from an offroad vehicle race which, in one of the true examples of "picking the low-hanging fruit," the management entity, if you will, for that watershed worked to identify some changes in the configuration of the race course which would be highly beneficial in terms of water quality management. This is the kind of observation that never would have come, quite frankly, from looking at tables of SIC codes and gross information on pollutant loadings from different types of sources.

Senator GRAHAM. I have two questions. The Canaan Valley is—

Mr. WAYLAND. West Virginia.

Senator GRAHAM. And SIC codes—

Mr. WAYLAND. Canaan was not an abbreviation.

[Laughter.]

Mr. WAYLAND. It's simply a place name that I didn't establish too carefully.

SIC is Standard Industrial Classification. That is used quite widely in trying to characterize the extent to which individual types of enterprises on average contribute to pollution.

Senator GRAHAM. Good. Thank you.

Mr. SPEAR. Mr. Chairman?

Senator GRAHAM. Mr. Spear, you get the last shot.

Mr. SPEAR. Mr. Chairman, I would like to reiterate the comment made by a couple members of this panel already. Right here in our

back yard, the Chesapeake Bay Program, led by EPA and supported by other Federal agencies, is probably one of the best examples in the world a program beginning to pay some results. You shouldn't have to go too far when we have something right in our back yard.

I would also like to call your attention to something that Assistant Secretary Lyons mentioned. The biggest effort in this regard is going to be undertaken in the President's Northwest Forest Plan, where the whole management of those forests in the future will be based on provincial plans which are then broken down into watershed plans. So while your committee is continuing this development of the new law, the administration will be undertaking a massive watershed planning and improvement approach that hopefully is consistent with the concepts that you are bringing forth in this law.

Senator GRAHAM. Mr. Fodor may publish his book on traveling to Europe; I think we may publish our book on environmental travels in the United States. I would hope that we might have the same financial success.

We have now been joined by the ranking member of this committee and one of the cosponsors of the bill that we have been discussing today, Senator Chafee of Rhode Island.

Senator Chafee, any questions, comments, or observations?

Senator CHAFEE. No, Mr. Chairman, and I apologize for being late.

You are a hard-driving taskmaster. How many of these hearings have you had?

[Laughter.]

Senator GRAHAM. Seven.

Senator CHAFEE. Each one has been very good. I am afraid you've left me panting behind you, trying to keep up with this pace. I regret that I wasn't here earlier. I'm sorry I missed this panel, but I will talk with our staff about what everybody said and review the testimony and look forward to—have you about finished with this panel?

Senator GRAHAM. I have a couple more questions.

Senator CHAFEE. OK, fine. I will look forward to the next panel.

Senator GRAHAM. Good. Thank you, Senator.

Senator CHAFEE. No one can say you're not being indefatigable in the pursuit of truth here.

Senator GRAHAM. Today it has been in the pursuit of acronyms.

[Laughter.]

Senator GRAHAM. I would like to ask a series of questions relative to the adoption of a watershed management approach, as distinct from what the focus has been in the past that I would, for summary purposes, call a "process approach" to fulfilling the national responsibilities for clean water.

What will be the difference in the type of information that we will need to collect in order to answer some of the questions that a watershed approach will require us to respond to? For instance, under the legislation of Senator Chafee and Senator Baucus, the issue is unimpaired watershed. Do we have enough data now to be able to identify the state of impairment of watersheds, and there-

fore be able to pursue the kind of prioritization of efforts that this legislation will call for?

I ask that as an example of the kinds of questions that this approach is going to require us to answer.

Mr. WAYLAND. Mr. Chairman, if I could just take a first pass at it, I really do think that we at present collect a great deal of information. It is not always easily accessible in forms useful to management decisionmakers, whether they're trying to make decisions on a national scale or at the watershed scale. I think an important challenge for us is to try to improve our ability to manage and rely on that information.

I firmly believe that in many watersheds it will be manifestly apparent when we stand at the foot of that basin and look around us that there are problems that can be addressed through practicable and affordable means, without the need for substantial and additional and more sophisticated data.

Having said that, as a first round, if you will, of "low-hanging fruit" that may be picked by applying this approach, we clearly do need to have information management and modelling tools that are applicable at a watershed scale, where we have tended not to employ those in most of our nationally based water quality management schemes.

Our suite of water quality standards is somewhat limited in terms of indicators of biological health. We are able to establish, for example, an aquatic life criterion, adopted by a State as a water quality standard, which tells us how much of a particular pollutant is lethal to certain indicator species of fish. But we have further work to do to establish criterion and standards that will tell us when we have a truly balanced and healthy indigenous population of fish as opposed to a lethal level of a particular pollutant. I think that's part of the evolution that we have underway.

Senator GRAHAM. Do you have any comments, either for today or for supplementation, on how the reauthorization of the Clean Water Act could facilitate advancing our ability to be able to get the kind of information that this new approach of watershed planning will require?

Mr. WAYLAND. Yes, Mr. Chairman, I would be happy to provide something at greater length.

Mr. WAYLAND. But just very briefly, I would say that the approaches that are advanced in S. 1114 to strengthen State monitoring requirements, we think, are generally very helpful. In addition, as I think all of us have said earlier, continuing cooperation among the Federal agencies that collect and store data so that it is accessible and usable is very important. I think we have a good start on that without the benefit of a legislative push, but I think that continued efforts along those lines are very important.

Mr. HALL. I would just reiterate what Mr. Wayland said. In terms of consistency, there is a lot of data out there, but in terms of making sure it is collected in a consistent manner—in many of these areas the collection of the data is the responsibility of the States. I think that in focusing on that area, the committee could make a lot of progress and help us in our work.

Senator GRAHAM. What I have found in my State, and I don't think it's atypical, is that collection tends to be for a specific pur-

pose. If you have a sewer plant, you have some collection of data to assess the quality of the effluent coming out of that plant. If you want to ask a different, broader set of questions about the quality of the river or bay or whatever that sewer plant is discharging into, you generally run into a blank wall because those were not relevant to the purpose for which the monitoring was being done. I might say personally, my major involvement in this issue has not been in the environment, but rather in education. The typical accreditation of a school, for instance, asks the question, "How many books do you have in the library?" So we collected data on how many books were in the library. If you wanted to ask a slightly different question, did anybody read any of the books in the library, or if they did read them, did they have any contribution to the enhanced education of the reader, no data was collected, so you couldn't get any answers to those questions.

I think we are now trying to ask some of the questions not just of how many books are in the library—i.e., what chemicals are coming out of that pipe—but rather, what is the effect of all of that on the broader question on the health of the watershed that we are attempting to protect?

I think the challenge is to have a system of information that will support our policy and management goals.

Mr. Peck?

Mr. PECK. Yes. I might comment on a couple of things.

One, I think that the drainage basin approach is a very good one. It is important in doing that to gather the monitoring data, but then to build a model, a computer model, so that you can simulate the impact of different changes, changes in land use and that sort of thing, on water, quality and water quantity. It is important to have land use data and the use of geographic information systems. The coordination of data standards are important.

There is an important activity underway across the Federal Government, the Federal Geographic Data Committee, where Federal agencies are all working closely together to develop geographic data standards.

I will say that one potential problem with the watershed approach is one that was found by John Wesley Powell, the second Director of the Geological Survey. He advocated that the west be organized by watersheds rather than by latitudes and longitudes. That was not accepted. You will find that organizing activities by watersheds, as you know far better than I, is politically difficult.

As far as recommendations on the Clean Water Act are concerned, I would like to pass on a couple of ideas.

One is that we think we're doing very well with the Water Information Coordination Program and the Interagency Task Force on Water Quality Monitoring. But recognition and support of these activities by this committee, and particularly our efforts to reach out to State and local organizations through that activity, are very important.

Second, I think that perhaps you need to think about addressing groundwater as well as surface water in the act. On the average, 40 percent of the flow in streams is from groundwater, and pollution of groundwater is going to affect the quality of water in streams; and it's going to do it, perhaps, many years later. Groundwater

flow is a very slow process. So I think that you need to look at the whole system when you address water quality.

Thank you.

Senator GRAHAM. Yes, Mr. Spear?

Mr. SPEAR. Mr. Chairman, I would like to bring out a slightly different approach.

The Fish and Wildlife Service has for years collected what we call "biomonitoring data." In other words, rather than going out and sampling the chemical factors in the water, we actually collected birds and fish, sampled them for chemicals, and then studied those birds and fish and their various types of diets to see how those organisms might be affected by various levels of contaminants.

That work was largely carried on for years under the Migratory Bird Treaty Act, or other acts, to look at the health of species.

I think what has been apparent throughout a lot of the testimony today, and I'm sure you've heard it elsewhere, is that we now need to have that organized in a different way and put a lot more focus on the biological effects of clean water or not having clean water.

So I would say that there is a need for legislation that ensures that there is a large biological component to any monitoring.

In the Department of the Interior, that sort of development of a biomonitoring component, which is part of other monitoring systems as well as what the Fish and Wildlife Service does, is coming together under the National Biological Survey. So I think we're going to have a home for that sort of activity, working with other Federal agencies, but it is the biomonitoring part of the thing that has never been supported anywhere near the way that the chemical monitoring has been done.

So if we're going to be able to look at the impact on wildlife as an early indicator for other species, then that part of the program is going to have to be supported, as well.

Senator GRAHAM. Who is the Chair of the interagency group?

Mr. PECK. Elizabeth Jester Fellows.

Senator GRAHAM. I wonder if we might ask if you could present the question that I've been asking, which is what if any changes we should incorporate in the Clean Water Act in order to meet the new monitoring and data requirements? And a second question, which is what you think it's going to cost in order to carry that out, so that when we come back in the fall to start our final markup we could have your best assessment of those questions.

Ms. FELLOWS. We would be glad to do that.

Senator GRAHAM. Good. Thank you very much.

Your name is—

Ms. FELLOWS. Elizabeth Jester Fellows.

Senator GRAHAM. Elizabeth Jester Fellows. And you are with?

Ms. FELLOWS. I am with EPA.

Senator GRAHAM. Would the record note that Ms. Fellows has committed herself—

[Laughter.]

Senator GRAHAM. I have one last question which I alluded to earlier, and that is the use of some of the remote sensing data. Both Senator Chafee and I happen to serve on the Intelligence Commit-

tee. One of the things I have been interested in is that we have this large investment in understanding the world for a military and security purpose; to what degree can that technology be applied to enhancing our knowledge of these types of issues? That raises questions of utilization of historic data which is currently classified, for nonclassified purposes, and in the future redeploing some of our resources to different applications.

What do you think is the potential in that area?

Mr. PECK. Could I comment?

Senator GRAHAM. Yes, Mr. Peck?

Mr. PECK. As you are aware, stimulated in part by the interest of the Vice President when he was a Senator, there is an effort going on to look across the board at the application of classified source material to environmental problems. Included in that effort is looking at the application of remote sensing to the definition of wetlands. Many of the agencies involved here, both the EPA and the Geological Survey, have been actively involved in that effort.

There are several ways that remote sensing can be applied to the definition of wetlands. There is a good experiment going on. Earlier I mentioned the Federal Geographic Data Committee. Under that committee, there is a subcommittee on wetlands, chaired by Bill Wilen of the Fish and Wildlife Service. The subcommittee has been carrying out an effort to compare the definition of wetlands by different agencies using different definitions. They have picked 10 counties from across the country to test. The first one in the Delmarva Peninsula. Each one of the agencies classifies the wetlands, sometimes using remote sensing. Then the USGS, using Geographic Information Systems, compares those, with the delineation of wetlands as defined by EPA, NMFS, NOAA, the Fish and Wildlife Service, the USGS, and determines where they differ and why they differ.

One of the best approaches to wetlands delineation was by the State of Maryland, using not satellite data but color infrared data in order to help define wetland areas. Multispectral scanners on satellites like SPOT and LANDSAT also have a lot of application for detecting wetlands. Other satellite data that can record changes in land use, like development of suburbs or commercial installations on what once were wetlands, are another useful way of tracking trends in wetlands.

Mr. HALL. Senator, NOAA has been in this area for a long time. They have been working hard to make use of existing satellite data and are working with the Defense agencies and others to look for new opportunities. The importance of this data can be demonstrated just in the recent developments in the midwest, where we've had a flood that has caused the levels of nonpoint source pollution in the Mississippi River Basin to be higher than at any time ever measured. We are tracking the movement of that fresh water, which will cause problems even without the pollutants, in the Gulf of Mexico. We are tracking the effects of that through satellite data. I think it offers tremendous promise for us to determine many changes there.

We have a program where we distribute remotely sensed data to eight regional nodes; this data is then used by State and local coastal resource managers, both in the area of changes in land use

and also in ocean color. The use of ocean color is something we are still looking at to determine all of the possibilities, but we have already related that to the management of endangered species and different changes in water quality, to better define eutrophication and the quality of those watersheds. So this is an area where I think, as we get more and more data, we will be able to do more and more for the States and local governments.

Senator GRAHAM. Yes, Mr. Wayland?

Mr. WAYLAND. Just to supplement that very briefly, it certainly is the case that land cover is extremely important in looking at possible sources of nonpoint source pollution. On the other end, just to supplement what Mr. Hall said, in terms of looking for indicators within the water bodies themselves of their health, in the Chesapeake Bay we have looked at seagrass bed viability and recovery as one of the indicators of ecosystem health for the Bay. I think it is an application that may also be available in looking at Florida Bay. As well, we have been able to look at algae blooms and their frequency and occurrence as another indicator of whether we have a problem and what the nature of that problem may be.

Senator GRAHAM. I spent Monday on Florida Bay with some scientists who are doing some research. One of their concerns about this satellite technology is that it is very expensive for users, such as academic institutions, to gain access to material that is freely available.

Is that a legitimate concern? And if so, is it something that we might be able to ameliorate?

Mr. PECK. If I might comment, there have been complaints that satellite imagery from the commercial organization that is running LANDSAT is expensive and prevents academics from using it. Partly as a result of that concern, Congress passed and the President signed the LANDSAT Amendments Act—that's not the exact title—that mandated construction of LANDSAT 7 by the Defense Department and its operation by NASA. The data will be distributed by the USGS, and those data will be distributed basically at the cost of distribution. So there is some hope for improvement over the next couple of years—and that the price of LANDSAT data will gradually approach that level over the next couple of years. NASA, Eosat, and USGS are working together to achieve that result.

Mr. HALL. Senator, one of the efforts that we're making through NOAA's National Oceanographic Data Center is to distribute images and data collection sets that we think would be useful to coastal managers. In your State, at Florida Bay, we are providing a lot of satellite data on Florida Bay to the State of Florida. But we strongly feel that the cost should be confined only to the cost of reproduction for these types of purposes. There are other commercial purposes in different situations, but we have invested a lot of money to collect this data and we should make the best use of it. The free flow of data is a very strong principle that we support.

Senator GRAHAM. Gentlemen, again, we very much appreciate your contribution and look forward to hearing from you further.

The second panel consists of Ms. JayEtta Hecker, U.S. General Accounting Office; Mr. Roger Woodworth, President, International Hydropower Association; Ms. Hedia Adelsman, Water Resources Program Manager of the Washington Department of Ecology, rep-

representing the Western Governors Association; and Ms. Wendy Nero, Water Conservation Manager for the City of Tampa.

Ms. Hecker, several months ago we requested that the General Accounting Office do a study on the status of monitoring, one question being the degree to which data collection was focused on assisting in enhancing management decisions. I appreciate your efforts in assisting in the preparation of that report, and we look forward to hearing a summary of your conclusions.

STATEMENT OF JAYETTA Z. HECKER, DIRECTOR, RESOURCES, COMMUNITY, AND ECONOMIC DEVELOPMENT INFORMATION SYSTEMS, GENERAL ACCOUNTING OFFICE

Ms. HECKER. Thank you, Mr. Chairman. I am really pleased to be here to support your deliberations on reauthorization of the Clean Water Act, and specifically to address issues related to the collection, dissemination, and management of the water quality data.

Let me just highlight the two observations I have today.

One is, and I think you've clearly recognized this in the questions you've been posing, that inconsistencies in the management of the data and incomplete and inadequate data have severely limited the assessment of water quality. That's why, after nearly \$500 billion of expenditures on water pollution abatement since the 1970's, it really still remains unclear where that investment is really benefiting us, what the state of the Nation's water quality is, and where the priorities really ought to be for the next steps.

The existence of this very severe problem with data quality is a fundamental problem that needs to be addressed, and we certainly applaud your attention to this issue.

The second point I want to make is to support the observations made by the previous panel, that very noteworthy efforts are underway, both within EPA, across the agencies, and in a number of the other agencies, although we haven't specifically evaluated them. They are promising; they are in early stages, but I think we will share today some concerns about the formidable nature of the challenges that are really before these agencies and the significant costs that we think may not have been brought out today to overcome the significant data problems.

Let me just start by focusing on the issue that there is an abundance of water quality data, but that it's difficult to use and is quite narrowly focused. I think you have heard that there are over 10 Federal agencies—and, more interestingly, over 165 separate Federal programs—that collect or manage water quality data. The problem is that most of them are not really collecting the data to support the managerial and decisionmaking concerns that you have raised, but more often than not are data repositories and have not been designed to focus on the needs of the watershed management approach, the pollution prevention approach that we're talking about today.

So despite the volume of data that is available, there are significant problems in trying to share or exchange or aggregate the data. It's incomplete, it's incompatible, and a very important factor is that it's often of questionable quality. Someone may be able to use it, but they don't really know what kind of considerations went

into the collection of it and what kind of validity problems may exist.

Recently we completed a report for Chairman Synar in the House on the Geological Survey's National Assessment of Water Quality. This is known as the NAWQA program. That report clearly observed the magnitude of the data management problems and the problems that the Geological Survey was facing in trying to integrate and use data from State sources, local sources, and multiple Federal agencies. In fact, just to create a baseline of the water quality in only 45 percent of the United States, it is taking 16 years, it won't be done until 2002, and it will cost over half a billion dollars. So I think that points out clearly that while people are trying to be cautionary, and although we're all working together and we're agreed that this is a problem worth focusing on that it takes substantial resources to really overcome the significant problems with the way data has been collected, the focus it has had, and the lack of any standards and consistency in that data.

So that's kind of the baseline of the magnitude of the problem that I think everyone stipulates to, but is perhaps not recognized as so significant.

I will quickly summarize the other points so that we have time to have a few questions in this area.

We do want to recognize the significant efforts in EPA to address and try to resolve these water quality data problems. We're not saying anything that EPA doesn't know, but again, our concern is that they are in the early stages, and the resources are real questions that ought to be examined.

EPA is also moving to modernize their information systems. Our view is that these environments are primarily just to improve user access to data. We are concerned that there really isn't a linkage to overall water quality goals. We found it difficult to see how these systems are being reengineered when their goal-setting effort isn't even finalized. The basic principle of good information design is that they are built around established, agreed-upon goals that the top of the organization is already committed to; yet this is happening only simultaneously in the organization. This modernization has been underway for two years. I might also note that it is funded within existing resources and has very, very little money to be devoted to this effort.

Another issue that you've expressed concern about is the use of remote sensing technologies. The real benefit that we found is for a more complete and timely understanding of land use changes that impact watersheds. That's really where you get the value of the use of remote sensing technologies. In addition, another important use is safer inspection of toxic accidents and spills.

We think it is important to put it in context, though, that at least with current technology, remote sensing technologies are definitely not a substitute for the direct labor-intensive data collection and analysis of water samples. So there are limits to its use, although they have appropriate uses.

There is a call by the Office of Technology Assessment, OTA, for better coordination in that area for civilian uses of remote sensing. We certainly think that is a recommendation that makes sense. It is mirrored by our own review of EPA's use of remote sensing.

There is no strategy within the agency, let alone coordination with other civilian agency uses in a way that OTA thought was really necessary.

The final area that we looked at was the Interagency Task Force on Monitoring, the ITFM. We endorse their efforts and think they are well focused. It is a commendable effort which shows promise for Government-wide improvement. But I was surprised that the previous panel didn't call for some clarification of the relationship of the Water Quality Monitoring Council that your legislation calls for, with the existence of the ITFM. We think that when Elizabeth Fellows gives you her comments, hopefully you will get some clarification of how the council you are calling for might relate to the existing group. The existing group is certainly much broader in its participation; I think they have far more States and localities, and even Indian tribes, involved. Your legislation calls for a specific composition.

However, in our view the benefit of the legislation is that it is a clear legislative endorsement for what right now is a voluntary effort.

Second, the legislative mandate or direction would undoubtedly promote more high-level involvement. It is, in our view, at a rather low level across the organizations. While that is a good level to get work done, you really need to see more commitment and involvement at much higher levels. We think the legislation would probably result in that.

The final observation of the potential benefit of the legislation in this area is that hopefully it would lead to increased stability in funding and increased stability in staffing of the organization. Right now it's completely voluntary. There are very few people on it on a full-time basis. Given the magnitude of the task that they face, the legislative mandate might increase the attention to it.

In summary, then, information and the quality and the structure and the standards that are used for information and monitoring data are clearly critical factors in the planned moves to watershed management and pollution prevention. Without significant and focused and well-supported efforts to improve the data, we believe that there will be significant problems in achieving those objectives of improvements in our water quality improvement efforts.

We have some ideas beyond that, but I might leave it for questioning of what we think some of the priorities are from here.

Senator GRAHAM. Thank you very much, Ms. Hecker.

The next two witnesses are going to give us somewhat the pros and cons of a specific issue, which is the role of the States in the siting of hydroelectric facilities. Although the order had Mr. Woodworth first and then Ms. Adelsman, since Ms. Adelsman is representing the Western Governors Association she might be able to frame this in the public policy context, and then we could have Mr. Woodworth comment from the perspective of affected users of hydroelectric resources. So I would like to suggest a reversal of the order, with Ms. Adelsman first.

STATEMENT OF HEDIA ADELSMAN, WATER RESOURCES PROGRAM MANAGER, WASHINGTON DEPARTMENT OF ECOLOGY, REPRESENTING THE WESTERN GOVERNORS ASSOCIATION, ACCOMPANIED BY CRAIG BELL, EXECUTIVE DIRECTOR, WESTERN STATES WATER COUNCIL; AND KRISTON DILLON, WESTERN GOVERNORS ASSOCIATION

Ms. ADELSMAN. Good morning. Thank you, Mr. Chairman and Senator Chafee. My name is Hedia Adelsman. I am the Water Resources Program Manager for the Department of Ecology. I am also a member of the Western States Water Council.

I have been asked today to testify on behalf of Governor Mike Lowry from the State of Washington, who is also a member of the Western Governors Association. With the Western Governors Association and the Western States Water Council, we actually work together to provide leadership in developing regional solutions in 18 States on water issues. I have been involved extensively in most of their water-related activities. I am pleased to represent the State of Washington, the Western Governors Association, and the Western States Water Council to testify on section 602 of S. 1114. My written statement was provided to you with copies of the positions of both the Western Governors Association and the Western States Water Council.

Let me say that it is not very often that I do come to the other Washington. Until you actually fly over five hours, you don't realize the distance and realize the impact that the distance represents. So I am very pleased to be here to express the interests of both the State of Washington and the other States.

Like several other States, the State of Washington has a significant hydropower development. Over 75 percent of our energy production comes from hydropower. Hydropower is a major economic resource to the State. We also have an extensive and very sophisticated water resource management program which is used to govern all water uses and related matters, including water quality. The department that I work for actually has the water resources and the water quality within the same department, and we work very hard to integrate both issues.

I think it is very critical that the States do exercise appropriate jurisdiction with respect to all beneficial uses of water, including hydropower generation. While section 401 actually extends the Federal license and permits to any Federal license and permit activities, my comments will be mostly concentrating on the licensing activity of the Federal Energy Regulatory Commission.

Let me first start by saying that no one—and I could speak for all States—no one questions the need for the exercise of Federal jurisdiction in the licensing of hydropower projects. I think the Federal Power Act establishes a strong Federal role. It also appears to define the States' significant role as well, and we have seen that role actually expanding over the years.

While my statement does provide some background on State and Federal jurisdiction in hydropower licensing, again, my comments will focus mostly on the 401 certification of hydropower under the Clean Water Act. It is a mandate that was delegated by Congress to the States to carry out. The States have viewed the certification

procedure as an appropriate recognition of State jurisdiction over water resources. It is a view that we believe is consistent with Congressional intent.

Most of the hydropower industry, however, has taken a much narrower view of State control, and I am here today to describe why a clarifying amendment, like section 602, is actually warranted.

The Clean Water Act, as you know, authorizes the State to issue or deny certification or to condition certification based on certain appropriate provisions. The breadth of the State's certification is based on various provisions of the Clean Water Act. However, the heart of that certification is really section 303, which deals with the State's water quality standards.

Application of the State certification process has proven to be very difficult over time. While there is some agreement that the States should have an important role, there was disagreement as to the scope of the 401 certification, with some of them seeing them as narrow and chemical water quality parameters. I was very pleased today to hear a lot of emphasis on other parameters besides chemicals.

The challenges to the scope of the States' review have really led to court battles. Some decisions have held against expansive States' roles in the Clean Water Act. However, others have held in favor of the States. I would like to give you a very recent example in the State of Washington. Our State Supreme Court has correctly held that actually the breadth of State certification under 401 should not be limited only to chemical parameters; rather, the Court found that the Washington Department of Ecology, the agency I work for, could condition its certification of a hydropower project on maintenance of an instream flow in a portion of the river that would be affected by the project. The Court found the instream flow to be a proper condition in the water quality certification. The Court also stated that inasmuch as issues regarding water quality are not separate issues from water quantity and flow, then an instream flow is a proper condition in the water quality certification.

Let me say that in the State of Washington the experience has been that we have had rivers, in some cases, with bypasses for over 50 years, where the fish disappeared and the habitat was completely wiped out. Through the water quality certification and the requirement of bypass flow, the fisheries are coming back. This is consistent with efforts in the Northwest by both Federal agencies, tribes, and the States to restore and maintain the fishery resources, and to—very importantly—avoid any further listing of endangered species. We think that that's going to be a critical problem. It is really beyond the spotted owl, when you start to talk about the salmon and the implication of that.

You may ask why we are supporting section 602 if our courts actually decided that we could do this under the existing legislation. Actually, we feel that it is important because it would clarify the result that the Washington case has come up with, and would make it appropriate in other States, especially in light of the conflicting court decisions. The amendment itself would settle the area of conflict by clarifying Congressional intent. The States should act in partnership with FERC to protect the water quality of the

Nation, and in trying to meet its mandate under the Clean Water Act.

Originally I thought I was going to come after Mr. Woodworth, who is also from the State of Washington; actually, it is interesting that we both come from the same State to testify on the issue, maybe a little bit on opposing sides. But I will go ahead and, given that I've read his testimony, actually present some of the argument—or at least present our views of some of the argument—that will be presented.

You may hear that section 602 is actually unsound because Federal preemption is necessary in hydropower licensing so that FERC, as a single agency, can balance the many conflicting public uses involved in hydropower. When actually examined in the broad context of water management, however, this argument is rather calling for special treatment of energy production instead of just fair treatment among all the other uses.

The States have carried out the premiere role in water resources management in the west, and Congress has repeatedly deferred to the State authority in this regard. As Federal interests have increased, this system of dual jurisdiction that would actually enable both the Federal Government and the State government to protect their legitimate interests has been developed and is evolving. This system is functioning very well in many programs.

Actually, opponents of the dual jurisdiction don't seem to be able to present any evidence that this system would not be able to work or that it is not in the public interest.

Also, and this is really hard for us to think of this—for them to argue that the State should now have a very limited role in time, where we actually try to expand the State's role in trying to bring the State into a partnership, is to say that the State has virtually no legitimate interest in this area in protecting the designated use and water quality. Far from being the case, the argument simply overlooks the ability and the expertise that the State water management effort has had in balancing the various goals.

The States are very close to the issue and they are ideally situated to deal with the very issues.

You also may hear that FERC is already addressing the State issues, either through comprehensive planning or through the Electrical Consumer Protection Act requirement that the project be consistent with State comprehensive planning. The difficulty with this assertion is that FERC really does not do comprehensive planning. It is not really equipped to adequately consider protecting all competing uses. Also, FERC has failed, in the opinion of the States, to give the deference to State water planning that was envisioned in the Electrical Consumer Protection Act.

So we feel strongly that neither the FERC comprehensive planning nor ECPA actually is an adequate substitute for the State water quality certification compliance.

The final argument is that FERC is a necessary arbiter in dealing with possible interstate conflicts. I should say that these conflicts are rare. In many cases they are within the State, and in other cases they can be resolved through existing mechanisms.

In conclusion let me say that the broad authority under section 401, and under the amendment, section 602, would not preclude

FERC from exercising its jurisdiction, but would assure the opportunity to protect legitimate States' interests. The amendment is very consistent with the policy statements that are contained in the document that you have and supported by the 18 governors and the Western States Water Council officials.

We are in support of this section and we feel that it is needed because it does provide the clarification that will avoid any further confrontation.

Senator Baucus and Senator Chafee have both rightly recognized in the provision of this bill, in its entirety, that State-based watershed planning and a more holistic means of managing water resources are necessary, and also to go beyond just the chemical, but also to get into some of the biological in starting to really look at integrating the various means. We feel that this section provides us with the tool to do that.

So we support this amendment and really urge that it be enacted as part of the Clean Water Act reauthorization, and we would like to commend the committee for actually introducing it.

I will be more than glad to answer any questions, either related to the State of Washington or to the Western States Water Council or the Western Governors Association. I do have here with me today Craig Bell, who is the Executive Director of the Western States Water Council, and Kriston Dillon, who is a member of the staff of the Western Governors Association.

Thank you, Mr. Chairman.

Senator GRAHAM. Thank you very much. I apologize; it's Adelsman, M-A-N?

21Ms. ADELSMAN. Adelsman, yes. But you said my first name very well.

[Laughter.]

Senator GRAHAM. In this business, being 50 percent right is pretty good.

Mr. Woodworth?

STATEMENT OF ROGER WOODWORTH, PRESIDENT, NATIONAL HYDROPOWER ASSOCIATION, WASHINGTON, D.C.

Mr. WOODWORTH. As Ms. Adelsman has referenced, I am from the State of Washington. I work at the Washington Water Power Company in Spokane in the State of Washington. I have had a rather interesting career myself, first as a fish and wildlife biologist, then into hydro licensing administration, dealing with the Federal Energy Regulatory Commission and the licensing process around hydro facilities, and then on into business strategy and management. But today I am here as a representative and in my capacity as the President of the National Hydropower Association; NHA is how I will refer to that as I go forward.

NHA is the national voice for the entire hydropower community. We represent public and investor-owned utilities, independent developers, and others who provide supporting services. We are an industry that is entrusted by the Nation through the licenses that we receive to steward and take care of the waterways which we develop for those interests that we ultimately serve; and those interests are, of course, the public.

It is in this context that I am here today, and that is to discuss the impact of the proposed reauthorization, this bill on federally licensed hydropower facilities and the important public interest implications that it poses.

I might also mention today that while I am here for NHA, the views that I will summarize for you from the written testimony are also shared by the American Public Power Association, the Northwest Hydroelectric Association, and I believe also the Edison Electric Institute.

Let's begin with some basics. The Hydropower Association is very pleased to be here today, to have this opportunity to provide our comments on this very important topic of section 401, specifically, how that plays out with respect to the energy issues of our industry. We are also very pleased with this draft of the bill as a starting point because it demonstrates a good effort to begin to coalesce the very diverse interests, as you are about to hear, that occur around this particular issue of section 401 and other issues in the act. Please do know that the members of NHA are very supportive of the protection of clean water and the achievement of healthy waterways, and support your efforts in reauthorizing this act.

Hydropower is not a polluting energy technology. There are no byproducts that it emits that need to be dispersed into our air. There are no byproducts that need to be disposed of in our land.

With respect to the use of water, it simply takes water from a river, spins a turbine with it, generates electricity, and returns the water to the river. This is not to say that it does not have water quality implications. When the water is returned to the river, it is returned without waste and without chemicals. The water quality implications that there are occur with respect to the storage of water and the regulated release of water; this occurs not only with a hydroelectric facility, but also with any dam that would be constructed.

Fortunately, there are techniques or methods that can be used to ameliorate those adverse effects and assure the maintenance of State water quality standards. So we are not working from a vacuum here; there are ways that these issues can be addressed and are addressed.

As project owners, our members are committed to working closely with State and Federal interests, and the other authorities responsible for these issues, with the objective of serving a very broad public interest. To that end, the comprehensive approach that is proposed in S. 1114, to maintain ecological integrity of the waterways and the surrounding watersheds—quite simply, it's a great idea. The more comprehensive we can be in considering the multiple interests around those uses of waterways is to our advantage and the advantage of our customers and the public.

The challenge will be to be sure that we don't end up with regulations or statutes that become duplicative or, worse, are conflicting. This will be the crux of the issue between what Ms. Adelsman has shared with you today and what I will share.

To work, a holistic or comprehensive approach in S. 1114 needs to take account of other equally vital interests that the Nation

holds, particularly where the issues are subject to comprehensive regulatory authority, such as under the Federal Power Act.

Let me turn to the Clean Water Act. Under it, the State water quality agencies do have the authority to require that the construction and continued operation of any hydroelectric project will maintain State water quality standards. And when properly construed, this process distinguishes between the authority to protect water quality and the authority to mandate or exclude a particular use of the waterway.

The former is within the authority of the State to protect; the latter is not. This approach is complimentary and integral to the comprehensive assessment of all beneficial public uses of the waterway, and that is a responsibility that Congress, starting in 1920 and continuing since then, has vested in the Federal Energy Regulatory Commission on rendering any hydroelectric licensing decision.

In contrast, S. 1114 proposes to extend section 401 authority beyond the maintenance of water quality to include authorities to allow for the protection, attainment, and maintenance of designated uses that are included in the standards. We are very appreciative of the States' desires to control both the quality and the uses of waterways in the States, but the added degree of control is neither necessary nor appropriate with respect to the regulation of hydroelectric development, particularly given the critical Federal interests that are involved in the use of the Nation's waters.

Ms. Adelsman's written testimony candidly explains that this issue is one of jurisdiction: who decides, as opposed to just how the health of the waterway is achieved. She made reference to some specific cases, the Tacoma case and others, and we need to note that the Tacoma case, while cited as Ms. Adelsman has described, is not the only case out there on this topic. There are many that contradict it, just as there are others that are supportive of it. The issue and the conflict are around jurisdiction, not how water quality or whether water quality is achieved.

In making licensing decisions under the Federal Power Act, the FERC is required to consider all beneficial public uses of the waterway. This is key when we talk about a comprehensive or holistic approach to waterway management. In this case with FERC, those beneficial uses include energy conservation, navigation, irrigation, flood control, water supply, water quality, water use, fish and wildlife protection, recreational opportunities, and other aspects of environmental quality, not to mention our national energy supply needs.

With respect to hydropower, the Federal Power Act should continue as the forum for adjudicating questions of competing waterway uses. Why? The simple answer is that ceding its authority to the States would fracture the carefully integrated Federal and State authorities that now encompass the current regulatory process.

In recognition of the States' interest—again, as Ms. Adelsman has alluded to—the Federal Power Act process and other Federal statutes have been expanding States' influence quite heavily now in that process, in the process for licensing hydroelectric facilities. But the approach that we have now does give full effect to the pur-

poses of the Clean Water Act, and importantly, it assures full consideration of the States' interests and preserves the intent of Congress that Federal interests in the use of the waterway will be regulated in service to the broadest public interest.

The States' interests in the use of the waterway are legitimate, there's no question about that, and they must be accommodated. But those interests should not, however, serve as a pretext for empowering States to provide or encumber waterway uses which are otherwise supportive of Federal interests.

Unfortunately, S. 1114's proposal to grant State water quality agencies the power to maintain and protect State-designated uses would have precisely that effect.

Senator CHAFEE [assuming Chair]. The red light is on, Mr. Woodworth.

Mr. WOODWORTH. I am at my concluding paragraph, if you would like me to finish.

Senator CHAFEE. Sure. Go right ahead.

Mr. WOODWORTH. As you proceed with reauthorization of the Clean Water Act, we urge you to do so in full recognition of these broader Federal interests in addition to the maintenance of water quality.

My written comments address other concerns of the hydropower industry regarding reauthorization of the act, and of course we will continue to work constructively with this committee and others on these and other issues.

My final note in closing, the approach of S. 1114 to resource protection has recognized the need to expand its scope to encompass entire watersheds and ecosystems. In so doing, an expanded scope of consideration is called for. Perhaps it goes without saying, but this is a critically important piece of legislation. It deserves to be crafted, in light of the broader universe of economic energy supply and other compelling public needs that we as a Nation must serve.

Thank you.

Senator CHAFEE. OK, fine.

Ms. Nero?

STATEMENT OF WENDY NERO, WATER CONSERVATION MANAGER, CITY OF TAMPA, FLORIDA

Ms. NERO. Good morning, Senator Chafee.

Senator CHAFEE. Do you have a statement? I don't seem to have a copy of yours.

Ms. NERO. No, this came about at the last minute through Senator Graham's staff. I would be happy to provide a written statement when I return to Florida.

Senator CHAFEE. OK, fine.

Ms. NERO. Good morning, Senator. I am pleased to be here on behalf of the Water Department of the City of Tampa. I will present our water conservation efforts and provide brief comments on the water conservation features of S. 1114.

The City of Tampa is a community of approximately 500,000 residents. In 1989, we provided approximately 76 million gallons of water a day. The water conservation program was created, largely as a result of rapidly growing population and a 27 percent increase

in water demands in about a five-year period of time. This, coupled with prolonged and severe droughts in our State and our region led us to create a conservation program at that time, was an emergency response measure. It was intended to simply stretch the available supplies until we could develop new alternatives.

This is a situation that is very, very common, which we are seeing more frequently across the country. It is not limited just to Florida. However, after a few years of implementing our short-term program, it became apparent that it was a valuable long-term water management tool and is now a permanent part of our water supply planning initiatives.

We have a comprehensive program that relies on economic incentives, regulations, and education. These together motivate water-efficient technology usage, as well as encouraging conservation behavior. Our program targets single and multi-family residential customers, commercial, and institutional customers as well.

Now I will go into a few features of our conservation program.

One of the technology-based efforts that we have in place is residential retrofit. We have approximately 90,000 homeowners who have nonefficient or water-wasting fixtures in their houses. We will have provided water-saving kits, as of the end of 1994, to all of these residents. Each kit includes shower heads, faucet aerators, and displacement devices for the toilets.

Senator CHAFEE. Don't go too fast. You supply these shower heads?

Ms. NERO. Yes, sir, we do. We package these kits and provide them free of charge to our residents. This is a fairly short- to mid-term measure; however, it does result in approximately a 12 percent savings inside the home.

A second program is considered more of a permanent-type fix. Again, we're focusing on bathroom uses because they comprise about 80 percent of residential water use inside the house. We have a toilet rebate program. This is a program where we provide a cash incentive, up to \$100 for each water-wasting toilet fixture that a resident replaces with one that is considered a low-consumption model.

Senator CHAFEE. How many gallons is that?

Ms. NERO. The low-consumption model? Approximately 1.6 gallons or less. There is new legislation that comes into effect January 1st, 1994, mandating this across the country. However, our program is designed to motivate homeowners to replace their fixtures sooner than they ordinarily would. That's a cash incentive program.

Another program we have features landscape water use and irrigation systems. In Florida our landscapes require supplemental irrigation, not only seasonally but all year long, which makes us different than most other parts of the country. In this program we offer landscape audits and irrigation evaluations free of charge to institutional customers, residential, and multi-family properties. In addition, we provide them with a free rain shutoff device which keeps their sprinkler from running when enough rainfall has occurred. That is common in Florida, seeing that we get 52 to 55 inches of rainfall in the Tampa Bay area.

Education is also fundamental to our success. We have a three-pronged approach to education. Number one, we feature in-school programs. This is critically important so that we have an educated public down the road who can make water-wise decisions. We provide teacher training and support the use of curriculum that has been developed by our regional water management district. Plus we provide in-classroom materials, live performances, and other programs that make the conservation information come to life.

We have a public education program that differs from what the bill calls for in that our program is not a mass media campaign, but is rather a very targeted program, it is intended specifically to generate customer participation in programs like the ones I've just mentioned.

Third, industry training is a critically important new effort. We have found that not only can industry be a great help with technology transfer to the affected parties, but it can also be a tremendous hindrance to effective technology transfer. We are working with the landscape and irrigation industries as well as the plumbing industry.

Another area of our program deals with utility management. These are fairly common measures. In Tampa we have gone one step beyond what is considered routine. We have a modified rate structure which establishes two blocks; each block is applied to every customer class. The level at which the second block, or the surcharge, is applied changes with customer class type.

Second, we conduct an annual water audit. A provision of the bill call for mandatory leak detection and repair. We feel that this is not cost-effective but may not be necessary in all communities, as is the case in Tampa.

Senator GRAHAM. You lost me there. You conduct an annual water ride?

Ms. NERO. Audit.

Senator GRAHAM. Audit?

Ms. NERO. Busch Gardens provides the ride; we provide the annual audit.

[Laughter.]

Ms. NERO. This is where we assess where our unaccounted for or lost water occurs within our system. There are lots of different ways that water can be lost. Leak detection is mentioned in the bill, as I said, and we suggest that perhaps the audit be required instead. In Tampa's case, we found that the greatest potential savings in a cost-effective manner could be achieved through meter testing, repair, and replacement, and that is our focus.

Regulations, another area of our program—we feel that these are critically important in high-growth areas. They build efficiency in up front as communities grow over time. We have three separate ordinances. Lawn watering is limited to certain days per week, the landscape code requires drought tolerant plants, and the plumbing code requires low consumption fixtures.

There are several reasons why our program has been effective, two of which are primary reasons that I will cite.

First has been the commitment from Mayor Sandy Freedman, as well as the elected officials in our community; and second, grants that have been made available from EPA, as well as regional water

management districts, have allowed us to implement programs where we might not otherwise have been able to afford to do so.

Senator CHAFEE. How about third, good management?

Ms. NERO. Good management is also important, as well, but I featured the two that I thought were most important.

Senator CHAFEE. We'll tell the Mayor you are doing a good job.

Ms. NERO. Thank you, sir.

Finally, I have a couple of brief suggestions on S. 1114.

The EPA has been assigned responsibility for coordinating the conservation features of the bill and are responsible for the clearinghouse. Technical assistance has been assigned to the Army Corps of Engineers. We feel that it would be most effective to combine these functions within one agency, which would provide both technical assistance and information sharing. We suggest that both those functions be housed within the EPA.

Second, conservation planning needs to be done in a broader context than is referenced. We suggest that the Integrated Resource Planning process or IRP, be embraced in this bill. This involves supply side and demand side planning of resource alternatives; it also looks at least-cost planning, and one of the unique features of that approach is that it involves an open and participatory process with the public.

Another point is that S. 1114 suggests that grants be made available to study conservation measures. Although study is very, important, especially with conservation, we find it would also be important to provide grants for implementation. This may be accomplished through grants, as suggested, but also we encourage looking at the existing State Revolving Loan Funds as a source of money, as well.

Finally I would like to say that I am pleased to have the opportunity to present Tampa's program. I believe that the bill provides needed direction to utilities, and it establishes a positive Federal role in motivating conservation.

Thank you again for the opportunity to be here.

Senator CHAFEE. I know comparisons are probably dangerous in this business, but do you have any statistics that would show, after all your efforts, the average consumption of water per day—however you want to do it—versus some other city of comparable size that hasn't done this?

Ms. NERO. We have found that our demands have reduced by approximately 12 percent, which is just under 12 million gallons of water a day.

Senator CHAFEE. Twelve percent from what?

Ms. NERO. From 76 million gallons a day to approximately 66 or 67 million gallons a day.

Senator GRAHAM. That's over what time period?

Ms. NERO. That's since 1989. It's over three and a half to four years.

Senator GRAHAM. So is the number of customers served approximately the same?

Ms. NERO. It has increased slightly. It has gone up from approximately 450,000 to 500,000. This is system-wide. We have a lot of industrial customers as well as commercial and business customers, as well.

Senator GRAHAM. So you're saying that since 1989, when you had 450,000 customers and you were using 76 million gallons a day, now—four years later, since you've implemented those water conservation initiatives—you have 50,000 more people, but roughly 10 to 12 million fewer gallons of water being consumed a day? Is that correct?

Ms. NERO. That's correct.

Senator GRAHAM. Is there any factor other than the water conservation effort that contributed to that reduction?

Ms. NERO. Well, at the same time we were experiencing a serious drought, a one-in-one-hundred-years drought event. The water management district at that time was imposing a series of mandates limiting lawn watering, eventually down to one day per week. We see that made a difference; however, at the same time demands also tended to be higher because of the drought and landscapes requiring more water. That also had some effect, but since Tampa now has a code requiring limited lawn watering, we feel that together helped us achieve our 12 percent reduction in demand.

Senator CHAFEE. I suppose that after all these efforts you reach a level that is pretty hard to get below, is that right?

Ms. NERO. That is correct. I would say the first 8 to 10 percent is the easiest to achieve; getting the last 5 to 10 percent will be significantly harder.

Senator CHAFEE. As you look across the country is there any model community that has done this and has a goal for you to shoot at?

Ms. NERO. I would like to think that Tampa is one of the leaders. Our goal was 15 percent reduction.

Senator CHAFEE. From the 1989 level?

Ms. NERO. Yes.

Other communities that are exemplary would be Phoenix, Arizona; Denver, Colorado; the City of Los Angeles. There's not a whole lot happening in the southeast part of the country.

Senator CHAFEE. Of course, you get a double winner. You get reduced water consumption and reduced demands upon your waste treatment facility.

Ms. NERO. That's correct.

Senator GRAHAM. You mentioned several linkages that you thought could be taken in order to encourage other communities to engage in this. What would you think about a proposal that would require a community to have a water conservation plan as a condition of eligibility for the various forms of Federal financial assistance? Some of this is being done in the utility areas, where a community or an investor-owned utility or REA has to demonstrate that they have taken conservation initiatives before they are allowed to expand their generating capacity.

Ms. NERO. I think the requirement for planning is definitely a good idea. In fact, the State of Florida is already doing this through our Water Management Districts.

I think we also need to be careful about what the plan should entail, what it covers, what it does. Equally important is not only what a utility suggests it will do, but on the backside, what it actu-

ally does. The monitoring and follow-up should also be a component of that.

Senator GRAHAM. Ms. Hecker, again, I want to thank you very much for the very significant report you have issued which, in the context of the first panel, will help us in our efforts to direct our data collection and monitoring more toward assisting in answering relevant questions.

Let me ask a question about the relationship between States and Federal agencies. It was stated several times during the first panel that most of the water data that we have is collected by non-Federal sources. What is your comment as to how effectively those non-Federal sources are being coordinated among themselves and with Federal agencies?

Ms. HECKER. The example I might use is the required annual report by States under section 305(b). Those reports form the basis of EPA's annual report on improvements in water quality. It is our view that EPA has had sufficient authority to establish guidelines and standards to get some uniformity in that reporting, but until very recently there was very, very little direction and guidance from EPA. As a result what you had is nearly 50 different ways of reporting, and a complete inability to use those reports to aggregate a national picture of the state of water quality and the trends in water quality.

EPA is moving forward. They are the natural body to establish the standards and guidelines, and it is ideal and appropriate—they are in fact coordinating through that Interagency Task Force. So we see progress in the right directions.

EPA, as you may know, is largely dependent on data from States and localities and other Federal agencies to make their decisions, almost across the board. Every decision requires data from other agencies. So it is absolutely essential that they work very closely and try to maximize the ability of that data to be integrated, to tell a coherent story, as well of course to have the most efficient collection of that data.

Senator GRAHAM. Senator Chafee?

Senator CHAFEE. Thank you, Mr. Chairman. Regrettably I have an appointment at 12:00.

Mr. Woodworth and Ms. Adelsman, your presentations were both very good. We are in heavy weather when we get into areas that you are involved in, the questions of water rights and all those things that we tend to treat very gingerly around here.

Let me ask you this, and I don't say this facetiously, Mr. Woodworth, are hydroelectric dams still being built?

Mr. WOODWORTH. Yes. The FERC does not license nearly as many new projects as they once did. I would have to consult on the numbers—

Senator CHAFEE. Again I'm not being facetious, but are any being built of any sizable scale? For instance, up my way many of the old dams that the original mills built that have been weakened, or even semi-destroyed, are being restored for little power generation, but this is small potatoes compared to what the west has. But the Bonneville Dam and Grand Coulee and so forth, they are really things of the past, aren't they?

Mr. WOODWORTH. The major projects, such as Grand Coulee or Hoover Dam or such as those, are finished, in terms of construction on the mainstream. But just for example, two years ago the Commission licensed a pump storage facility for 1,100 megawatts, I believe it was, over 1,000 megawatts. So there are large capacity projects that are still making use of the Nation's waters, but they are not of the same character as what you're referring to, the Hoover Dams and the Grand Coulee Dams.

Senator CHAFEE. I was thinking of Telico and things like that.

Mr. WOODWORTH. Not of that character, no. Around the country there are a number of smaller-scale facilities that are under construction or in the process of license, but they are not on the order of magnitude of Grand Coulee, no.

Senator CHAFEE. No.

Well, you and Ms. Adelsman aren't in total accord.

[Laughter.]

Mr. WOODWORTH. Just on this issue.

[Laughter.]

Senator CHAFEE. Did you come east together?

Mr. WOODWORTH. No, we didn't.

[Laughter.]

Mr. WOODWORTH. But we may go home together.

Senator GRAHAM. Senator Chafee, I would suggest you not continue that line of questioning.

[Laughter.]

Mr. WOODWORTH. Senator, I might also add that FERC's responsibilities go beyond new projects, and they also have a responsibility to license existing facilities, or to relicense those, and a number of those do propose expansion of their capacities to take advantage of the facilities that are already there, to make more use of what's there. So that's another area.

Senator CHAFEE. Ms. Hecker, as I got your testimony—and I'm scaling it way, way down—it seems to me that the point you were making is that the monitoring capabilities in EPA have been devoted to point source pollution—

Ms. HECKER. Yes, sir.

Senator CHAFEE. —and specific discharges.

Ms. HECKER. That's correct.

Senator CHAFEE. Whereas the problems current are arising from pollution stemming from millions of nonpoint sources, and that's not being measured. Is that what you're saying?

Ms. HECKER. That's largely correct, but even in terms of the data that has been collected on point sources, the data that has been built are largely repositories. For example, there is one major database that documents all the permits. There's another major database that houses all the ambient data, the statistics on the actual quality of the water. Those databases weren't built together. They weren't built for the decisionmaking of whether to continue a permit, to modify it; they're not linking—they're not readily able to link the decision, even in the point area, of what the implication of a given level of discharge really is for the quality of that water or watershed.

Senator CHAFEE. All right. Well, I appreciate the thoughts you've given us. Sometimes the information is alarming; I think in one of

the points you made, the data is collected and managed by over 165, I think you said, Federal and State entities. But some of those really must be local waterworks, just testing their water. It isn't as though we have 165 different entities racing around, monitoring water quality?

Ms. HECKER. Well, there are 10 Federal agencies, and most of the programs are under those agencies. For example, at USDA—or even today, here—we have the Geological Survey and the Fish and Wildlife Service, and the Secretary there is concerned about the fact that their own data isn't integrated and he is moving toward integrating it within that department.

So maybe 165 doesn't have to mean there is a complete absence of coordination, but it's the magnitude of relatively parochial efforts. That's really what it's about, is that the data is collected with a very narrow perspective to support a specific policy or program or decision, and that impairs its ability to be used by other parties.

Senator CHAFEE. OK, fine.

Ms. Nero, you certainly gave a good presentation and showed us what can be done when serious efforts are made on conservation, and I hope you get that final 5 percent. You are shooting for 15 percent below the 1989 levels?

Ms. NERO. That's correct.

Senator CHAFEE. Regardless of your growth in population?

Ms. NERO. That's right.

Senator CHAFEE. Well, that's a bold goal. I wish you success in it. It sounds like you're certainly doing everything you can.

Senator GRAHAM. She represents a bold city.

[Laughter.]

Senator CHAFEE. And a State that has had great leadership.

[Laughter.]

Senator CHAFEE. Let me just ask you this. When you do things like provide kits for showerheads, and the installation of the toilets that are 1.6 gallons as opposed to something around 3 gallons, and you put that in at a discount of some type, obviously this costs money. What is the money saving? Or is this just an appropriation? You don't get a cash saving anywhere, do you?

Ms. NERO. No, we wouldn't see a cash saving per se—

Senator CHAFEE. Except not having to build such a big waterworks?

Ms. NERO. Right. And that's precisely how the water savings are evaluated.

The funds to pay for the program come from a series of grants, as I mentioned, as well as revenues from the Water Department. We make sure that our rates create sufficient revenues to fund these types of programs, as well as future additional supplies, which we think will also be necessary.

The cost of water we have saved, was done so at a cost of less than \$0.20 per thousand gallons, whereas water is sold at a cost of approximately \$1.00 per thousand gallons. So the cost of conservation is significantly less.

Senator CHAFEE. Well, you can collect that from your water users, can't you?

Ms. NERO. That's right.

Senator CHAFEE. Tell me this. Is there much of a relationship between water charges and water consumption? Except if it gets very high? In other words, if you increase your rates, if you ask anybody, "What's your water bill," I think they wouldn't know. At least I don't know what mine is. It's not a big factor that one tosses and turns at night over.

But is there much of a relationship between what you charge and consumption?

Ms. NERO. We're finding that our residents are becoming more and more aware. As our rates were changed in 1990, it was based on average monthly usage by customer type, so they suddenly became aware of what their average usage was because anything beyond that they were subject to a substantial surcharge.

Also, the water bills can get considerably higher in Florida than other parts of the country due to lawn watering, and that is precisely where we are trying to get their attention, because that's the most flexible or discretionary use around the house or, in many cases, businesses. So they are becoming more and more aware of that.

Senator CHAFEE. Businesses consume a lot of lawn water?

Ms. NERO. Yes, in fact, they do. I don't know what percentage of their total demand it would be; it would depend on the business type. But, yes.

Senator CHAFEE. Well, thank you. These were good witnesses.

Senator GRAHAM. Thank you very much.

A wise man is leaving our presence here.

[Laughter.]

Senator GRAHAM. Ms. Nero, in Tampa, what are you doing in terms of recycling your wastewater as part of a conservation effort?

Ms. NERO. Tampa has a unique situation. We do not have active recycling programs right now, the reason being that Tampa has a central, far-removed wastewater treatment plant, unlike other communities, with frequent reference to St. Petersburg. We are looking at the possibility of direct reuse. We are looking at the—

Senator GRAHAM. Excuse me, direct what?

Ms. NERO. Reuse, where we would provide reclaimed water back into our water supply source upstream, or into injection wells which would be pumped from during the dry season.

We are also looking at cooperative arrangements with Hillsborough County, in locations where they have wastewater plants in close proximity to our developed areas.

Senator GRAHAM. Ms. Adelsman and Mr. Woodworth, and I apologize for having to miss part of Mr. Woodworth's testimony, but what I heard was that you started off with some positive comments about S. 1114 and how it dealt with the issue. Ms. Adelsman also had positive comments. I'm a little bit confused because you have a difference in policy, but from what I gather you both think that the language that is in S. 1114 is a good resolution.

Did I hear correctly?

Mr. WOODWORTH. You missed part of it.

[Laughter.]

Mr. WOODWORTH. Let me go first.

S. 1114 proposes a concept to broaden how waterways are viewed, how the health of waterways is viewed, and it proposes a broad-

ened context for reviewing those watersheds and ecosystems. That is a good thing, and that's what you heard.

The caution that we're raising here is that as that concept unfolds, that it not cause duplicative regulation, or worse yet, get into conflicting regulations in other areas of equally vital national interests. The one that we're here to speak about today from our perspective is the hydroelectric industry. It does have a very long and well-established history of Federal statutes dating back to 1920 in how it is regulated, and what the paradigm between Federal and State jurisdiction is.

The testimony that Ms. Adelman provided is suggesting not issues surrounding the health of the waterways, but around how the jurisdiction of that issue is to unfold, what the paradigm will be. I would suggest that she is suggesting a different paradigm than the one we've lived under for the last 70-plus years. That is the crux of the difference between the two perspectives that we share. The States' interests are legitimate; there's no question about that, and they do need to be accommodated. But our view would be that they need to be accommodated in the context of the existing paradigm, and that as this legislation unfolds it needs to be cognizant of that context, because if it is not it will lead to duplication and, worse yet, the conflicts that we're suggesting.

MS. ADELSMAN. Senator Graham, we are endorsing section 602. We feel that it is a clarification; it is not an addition to the authority that is already there.

The reason we feel it is a clarification is because it does clarify the scope of the 401 review and the scope of the standards and it gets to why we are setting standards and for what purpose. Clearly, section 602 defines the purposes a little more clearly than what we had before; however, we have to go back to the intent of the Clean Water Act. It is still the policy to restore and maintain both the chemical, physical, and biological integrity of the waters of the States. So the intent from the beginning of the Clean Water Act was to be beyond just the chemical.

I just want to make a very brief comment to illustrate why this is critical to us. When Mr. Woodworth was talking about hydro-power not being polluting, really, when we are dealing with hydro-power we are dealing with bypasses. Yes, the water is taken and is put through a turbine and is released downstream; in some cases in the State of Washington it is maybe 25 miles below where it has been taken. That reach of the river that has now been bypassed in many cases has no flow in it. That results in a major disruption of habitat. It's really difficult to say that that's not an environmental impact and is not part of the scope of the water quality certification, to mainly look at the dissolved oxygen and the temperature of the water when it is returned, and ignore the 25-mile reach of the river that is completely dried up and where the fish have disappeared.

So the State has taken an aggressive role in looking at the 401 scope, both at what's happening to the water when it is returned, but also what's happening to the water when it's being taken, what's happening to the reach of the river.

I should say when we have established instream flows, we have had tribes, Federal agencies, and several State agencies involved.

We look very carefully as to what the designated uses are. The State of Washington has not yet denied 401 certification to any hydropower, so this has really not been an issue. We actually license many projects; a lot of these projects are still operating, and they are still generating the power that is there. However, we have taken a very assertive role in restoring and maintaining flows in the bypasses, and we see that as part of the intent of the Clean Water Act.

I am really glad to see it even strengthened and made even more clear. I read a statement made by Senator Chafee that said it is good to have clean water, but if there are no fish there to come back to it, we haven't really accomplished what we wanted to accomplish.

So we don't see it as jurisdiction. We see it as the scope of the review and the scope of the 401, and this amendment actually really clarifies it.

Senator GRAHAM. Ladies and gentlemen, I appreciate very much your contribution to our hearing today and our understanding of your particular important aspects of the Clean Water Act. Thank you for the efforts you have made to travel such a distance to be with us today. Thank you.

[Whereupon, at 12:08 p.m., the subcommittee adjourned, to reconvene at the call of the Chair.]

[Statements submitted for the record follow:]

STATEMENT OF JAMES R. LYONS, ASSISTANT SECRETARY FOR NATURAL RESOURCES AND ENVIRONMENT, DEPARTMENT OF AGRICULTURE

MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE: I am pleased to have this opportunity to discuss the views of the U.S. Department of Agriculture on the reauthorization of the Clean Water Act. Today I am accompanied by John Burt, Associate Deputy Chief, Soil Conservation Service, and William McCleese, Director of Watershed and Air Management, U.S. Forest Service.

Water quality is a crosscutting concern and has the potential of affecting agriculture and USDA programs more than the current Farm Bill. The quality of water from a watershed is influenced by the way we farm, harvest timber, graze cattle or confine livestock for efficient production. This is why USDA must be involved in the future Clean Water Act.

S. 1114 helps provide the support and program direction needed. The watershed approach is the most effective way nonpoint sources of pollution can be effectively managed. In my testimony today, I would like to discuss USDA experience in water quality, both on privately owned lands and on Federal lands.

Privately Owned Agricultural Land

First, USDA has numerous programs that have had, and are having, an impact on water quality on privately owned lands. Let me share with you a brief summary of one such program—the conservation compliance provision in both the 1985 Food Security Act (1985 Farm Bill) and the Food, Agriculture, Conservation and Trade Act of 1990 (1990 Farm Bill). Under conservation compliance, Congress linked, for the first time, an individual producer's performance on environmental issues to their eligibility for USDA farm program benefits.

To remain eligible for USDA farm program benefits, conservation compliance requires farmers to develop and carry out approved conservation plans on highly erodible cropland. Since the inception of conservation compliance, SCS has worked with farmers to develop more than 1.5 million conservation compliance plans. Each plan contains an implementation schedule and the agency uses a system of random spot checks to ensure compliance.

When fully implemented these plans will significantly reduce soil erosion on some 142 million acres on participating farms in the United States. To date, more than 50 percent of the plans are implemented. Full implementation is due, by December 31, 1994.

SCS estimates that fully implemented conservation compliance plans, combined with the grass and trees planted on the more than 35 million acres enrolled in the Conservation Reserve Program, will cut the soil erosion rate on highly erodible cropland in the United States by about 65 percent. In areas where sediment is the primary problem, conservation compliance will have the effect of improving water quality.

Without question, conservation compliance is one of the biggest challenges faced by USDA. It is also important to realize that conservation compliance is not just a big undertaking for USDA. For some farmers, the conservation practices called for under conservation compliance represent a major change in farming practices and farming culture. So too, will be any agricultural requirements contained in the Clean Water Act. And cultural changes do not happen overnight.

Second, let me quickly bring you up to date on the Department's water quality activities on privately owned agricultural land, the most extensive source of nonpoint pollution.

Our first major effort began with the Rural Clean Water Program in 1980 to implement nonpoint source abatement practices and to monitor changes in water quality. It involved 21 projects that were selected on a watershed basis.

USDA's National Conservation Program in 1988 established protection of water quality from agricultural pollution as a national priority. As a result, agencies began to redirect resources where possible to address water quality concerns. This resulted in:

- Increased research in such areas as developing predictive models, evaluating agricultural chemical transport, searching for plant species requiring less pesticides, and alternative pesticide use.
- Improved technical assistance capability to farmers and ranchers by adding water quality conservation practice standards in the county SCS Field Office Technical Guide.
- Increased technology transfer.
- Educational and information materials directed to farmers and ranchers to make them aware of the water quality concern and to provide guidance on how to correct obvious problems.
- Financial assistance, where possible, to help farmers and ranchers install cost-effective environmental practices and/or to try new methods of farming or ranching.

We're using all our available resources to help reduce the agricultural water quality concern. Today, we have about 135 water quality projects across the country. These projects deal with surface water, ground water or a combination of both. We have used the program authorities and resources of 15 programs to implement water quality planning and implementation.

USDA has also reached out to form partnerships with industry, farm organizations and with other agencies to help implement water quality improvements. Some of the progress includes:

- Trade publications featuring information for farmers and ranchers on agricultural water quality issues.
- Work among USDA, EPA, and agricultural organizations to develop a pollution prevention plan of action.
- Development of the first pesticide characteristics data base to make relative predictions of risk for pesticide movement to surface or ground water from different soils.
- Staff detailed to industry. The first detail was to the Southeast Poultry and Egg Association.

USDA is working closely with EPA on many water quality issues and projects related to agriculture. USDA and EPA have jointly funded SCS staff positions for all the EPA Regional and National offices, provided support to the National Estuary Program, and assisted EPA and the National Oceanic and Atmospheric Administration (NOAA) in developing technology-based management measures for the Coastal Zone Management Reauthorization Act Amendments. EPA has two persons detailed to USDA.

In addition, the U.S. Geological Survey and EPA are assisting USDA in monitoring some of our water quality projects and cooperating in several research projects.

As you can see, the agencies are cooperating on water quality efforts within the limits of their resources. The agricultural nonpoint source abatement effort requires a mix of expertise and program capability to implement effective water quality projects and conduct research.

We firmly believe the partnerships with agencies, agricultural communities, State governments and local people must be continued and improved. Federal and State governments cannot implement water quality improvements without the support of the local people and the agricultural community. This is the key reason for the watershed approach and it must be fully supported by all Federal and State agencies—especially USDA.

Our experience—which I've just touched on—has taught us some valuable lessons:

- First, patience. It takes time for water resources to respond to reduced nonpoint source loads.
- Second, rely on observable results. Monitoring of physical and chemical characteristics of water provides important information for determining impacts on water quality and on identified beneficial uses of water. In addition, monitoring of biological characteristics is important for understanding the impacts of nonpoint sources of pollution.
- Third, on-farm application is essential. When farmers were able to relate their farming activities to the water quality concern, they were willing participants to the solution.
- Fourth, always remember that a delivery system which can implement programs at the local level is absolutely vital.
- Fifth, our experience shows that solutions which come from the bottom up, rather than the top down, work best. Local solutions and local controls, with appropriate Federal and State backup, are preferable.

The farmer must make daily management decisions. To include water quality concerns in the decision making process, the person must know how those daily decisions affect water quality. The farmer's decision on the "back 40" will influence the water quality from the watershed. This will require USDA to reorient its educational and technical assistance to focus more on water quality.

The nonpoint source problem is enormous. Preliminarily, EPA estimates that it would cost \$8.8 billion over 20 years to control agricultural and silvicultural nonpoint sources on all lands. We have not yet estimated the needs for the more targeted approach we are supporting today, but the cost should be lower. It should be viewed just as an estimate. But if you add in mining, urban, roads and airborne sources, you begin to see the magnitude of the problem. In addition, the problem, once solved, doesn't stay solved. Land ownership and use changes, as does the weather. The desire of society for a quick fix of the nonpoint source issues must consider the difficulty in making major shifts in farming, mining, building roads and so forth. This is why the State and local governments must play a key role.

The watershed approach in S. 1114 is very sound and should effectively accomplish the objectives of the Clean Water Act without major public resistance. However, it will require someone with experience in watershed planning and resource management at the local level to facilitate the process and assist in implementation. The Soil Conservation Service and Forest Service can assist in providing this service at the local level in partnership with EPA and State governments.

In the continental U.S., there are well over 10,000 watershed units identified by the U.S. Geological Survey Hydrologic Unit Catalogue System that vary in size from 250,000 acres to 450,000 acres. These units are "nested" within 300 to 3,000 larger basins. Smaller watersheds are preferred because local people can better focus upon and understand their influence on smaller basins.

From our experience, we would recommend three ways to make the watershed concept work for water quality.

First, continue to involve USDA.

We have the field staff, the experience and the multiple disciplinary technical skills necessary to supplement efforts already in other agencies to implement the watershed approach. You'll need the energy of experienced people to serve as a catalyst to get the process started and you'll need technical and educational assistance to get the watershed plan implemented.

Second, make the program flexible.

This is especially important because:

- No two watersheds are alike. Some may need only very low intensity evaluations and plans of action because they have obvious or very few problems.
- Watershed management is a new concept for Clean Water Act implementation. Different approaches will be needed. The States and Federal government need flexibility in implementation and funding. We must rely on the States, with

Federal government assistance and oversight, to develop watershed programs tailored to their State resource conditions and local citizen involvement.

Third, involve local people and institutions.

The people involved in the problem need to be involved in the solution. Without general support, a water quality program is doomed for failure. To illustrate, how do you know how much fertilizer or pesticide a farmer is applying? How can you police it? River Basin authorities, State governments, conservation districts, county governments, or other local organizations should all play a role. Federal government agencies should provide their skills and resources to support the process.

Federal Forest Land

Now I will turn my attention to the National Forest System. The Forest Service is responsible for managing for multiple-use purposes the 191-million acres of forest and range land that comprise the National Forest System. The challenge for the Forest Service is to manage with an ecosystem perspective for all uses, while ensuring the protection of the basic soil, water and air resources that are crucial to sound stewardship of the land.

The Forest Service is actively involved in research, development and implementation of management practices designed for the control of nonpoint sources and the protection of forested watersheds. This leadership extends back to the formation of the National Forests. National Forests were originally withdrawn from the public domain for the purpose of securing favorable conditions of water flow and to ensure a continuous supply of timber. It is not possible to maintain favorable conditions of water flow without protecting watershed condition and water quality. Based on this experience and knowledge, the Forest Service has developed a watershed management strategy for protection of nonpoint sources based on two basic components: prevention and rehabilitation.

Our prevention program is designed to prevent the creation of problems from ongoing and future resource management activities. Land management prescriptions are designed to protect water quality and associated beneficial uses. Monitoring is necessary to ensure that practices are implemented as designed and are effective in providing the necessary protection. Mitigation is used when monitoring shows that unforeseen problems have been created. Finally, land management prescription design criteria are adjusted, where appropriate, to prevent problems with future activities. This iterative process is designed to allow for land use while protecting water quality and water dependent resources in the long term. Land management prescriptions are currently being designed and adapted with the best science available.

Our rehabilitation program is designed to restore those lands that have been damaged by past activities. Lands needing improvement have been identified and inventoried. These lands will be restored to reduce and eventually eliminate contributions to the nonpoint source problem.

Forest Service policy is to comply with all State requirements for protection of water quality in the same manner and to the same extent as a nongovernmental entity. In most States, we have developed and implemented working agreements. Under these agreements, the Forest Service is responsible for implementing State nonpoint source water quality programs on the National Forests. Through review of proposed Forest Service programs and monitoring of activities, the States are assured that Forest Service programs meet State nonpoint source water quality requirements.

Comments on S. 1114

I will now offer comments specific to S. 1114. We are delighted to see that S. 1114 is taking the watershed approach to help implement water quality improvement programs—an approach that is consistent with our philosophy of managing ecosystems on a watershed by watershed basis.

We have found this to be the most effective way to control nonpoint source pollution. It has the flexibility needed to solve a very dynamic and complex problem. It allows for the uniqueness of each watershed. It allows for a multi-disciplinary approach. It virtually demands local involvement. It requires interagency cooperation and shared resources. It depends upon the implementation of cost-effective, practical solutions.

EPA, in consultation with USDA and others, should provide watershed program requirements for the State to follow. The State would be responsible for developing a watershed program that meets the State land and water resource needs and meets EPA requirements. EPA would approve the State watershed program and provide

implementation oversight and assistance. USDA needs to be involved throughout the entire process—from the State level through EPA approval.

As a minimum, a State watershed plan should list the targeted watersheds, identify water quality concerns in the watersheds, specify a schedule for developing the plan, and require coordination with appropriate Federal agencies, including land management agencies, and identify Federal and state assistance available through existing programs.

We have, however, identified several questions and concerns about S. 1114. Some of our concerns are directed to those areas where we believe that change in the current Act could interfere with effective programs for controlling nonpoint sources of pollution. USDA's experience in nonpoint source control, gained from working cooperatively with EPA and State agencies on agricultural land, and research and watershed management on forest land, gives us confidence that our assessment and recommendations are sound.

USDA supports the Farm Bill incentive programs now being used to address nonpoint source problems. USDA and EPA have been operating with the understanding that, as watersheds are identified for treatment, critical areas and sources will be identified, land management prescriptions identified and a schedule set for implementation. The time frame for implementation will vary with size and complexity of the treatment. Water quality standards should be used to identify problem areas and to measure the effectiveness of land management prescriptions.

At the end of the implementation period, if water quality standards are not met, an evaluation should be made to determine (1) if the level of treatment applied was adequate but the system has not been given enough time to respond; (2) if additional treatment is needed; or (3) if existing water quality standards are inappropriate consistent with provisions of section 303 of the Clean Water Act. If it is determined that additional treatment is needed, the process would be repeated.

Pollutants are stored in the soil profile and sediments, the water and in aquatic biota. Adequate time must be allowed for these existing materials to be removed before full recovery can be expected.

Implementation of management measures in impaired and threatened areas could be based on site specific plans as an alternative to National management measures. Conservation or management measures should be designed to specifically address the identified water quality problems.

Section 304(d) entitled Federal Program Coordination is opposed by the Department. The provisions of the Food Security Act of 1985 and the Food, Agriculture, Conservation, and Trade Act of 1990 already have provisions to establish priority to water quality problems identified in State 319 management plans. The effective management of these programs for their intended purpose will be jeopardized if the Secretary is required to restrict their availability.

These programs are administered to be responsive to the natural resource and environmental concerns of the nation and go beyond water quality alone to deal with issues such as wetland restoration, endangered species habitat protection and restoration and aquifer and groundwater protection. USDA needs flexibility, not more restrictive legislation.

In general, USDA is not opposed to a requirement that Federal lands be managed in a manner that is consistent with that required on private lands. In fact, the Forest Service does just that. USDA continues to be committed to the use of best management practices as required in the current law and agrees that it should comply with management measures in watersheds to the same extent as non-Federal entities in those watersheds. It does not, however, believe that it is necessary to regulate this activity. While we do not oppose this requirement, we believe the existing Executive Orders are adequate if carried out by all Federal agencies.

As we have indicated, USDA supports the emphasis on a watershed management approach to nonpoint source control contained in S. 1114. This is largely consistent with the direction already taken by the Forest Service and the Soil Conservation Service in implementing new ecosystem strategies for natural resource management. Control of nonpoint sources can be best achieved if approached in a holistic manner through watershed management. An analysis of watershed conditions, and an understanding of the relationships of land management activities on the water resource, allows a meaningful way to allocate and distribute land management activities in an efficient and effective manner.

While S. 1114 contains direction for the States to designate watershed management units, and to determine the entity responsible for developing and implementing a watershed plan, there is no reference to the role of Federal agencies in managing public lands. It is not clear how State watershed management programs would affect land management plans developed by the Forest Service for management of

the National Forests. There could be a conflict between Watershed Management Plans developed by the States for water quality protection and Forest Plans developed by the Forest Service for multiple-use management. We recommend amendments to clarify the respective roles of both State and Federal agencies which focus on a coordinated program that will satisfy both the Federal and State purposes.

Section 202(c) of S. 1114 would add language establishing antidegradation policy. This section identifies all waters in the "national forest" as Outstanding National Resource Waters. This designation, coupled with current EPA regulation for such waters, may interfere with multiple use management of the National Forests. The basic concept is that such waters cannot be degraded, even where water quality is higher than that necessary for protection of the identified beneficial use. While we agree that the waters originating on National Forests are important, we believe that it will be difficult, and in some cases impossible, to meet our responsibilities under other legislative mandates and meet these new requirements. This includes responsibilities under the Multiple-Use Sustained Yield Act of 1960 and the National Forest Management Act of 1976, and other authorities that direct the USDA to manage the National Forests for multiple use. We recommend the term "national forest" be deleted.

Section 304(a) of S. 1114 would add language identifying the "harvesting of timber or the construction of a forest road" as a "new source." Those lands that have been identified in the Forest Planning process to be suitable for the production of timber undergo many activities over a rotation period. This includes planting, stand improvement and harvest. While it is true that a long time elapses between harvests, these lands are often undergoing extensive management during that period. We have concerns about the definition of "new source" in S. 1114, and we will be working with EPA on a recommended definition for "new source" as it relates to forestry and will jointly provide that to the Committee in the near future.

Section 304(d) "specifies that any license, permit, contract, special use permit, lease, agreement, claim, or related operational authority between a Federal agency and any person authorizing activities on Federal lands in effect on the day before the date specified in subparagraph (B)(ii) *may remain in effect for the term of the authority or a period of 5 years (beginning on the date specified in subparagraph (B)(ii) whichever is less.*" (Emphasis added.) This section would require that authorizations issued by the Forest Service, and currently in effect, to use and occupy National Forest System lands for private and commercial activities would be terminated within a period of five years from passage of this bill which could be before their scheduled expiration date. These authorizations, which may take the form of contracts, permits, term permits, easements, and leases, are issued under several statutory authorities, including the Term Permit Act of 1915, the Federal Land Policy and Management Act of 1976, the National Forest Ski Permit of 1986, the Mineral Leasing Act of 1920, the National Forest Roads and Trails Act of 1964, and the National Forest Management Act of 1976. Many of these existing authorizations are for longer than five years, such as the 40 year ski area permits, certain 30 year permits and the 50 year timber sale contracts in Alaska.

The USDA has approximately 72,000 of these use authorizations in effect. Uses of National Forest System lands typically authorized by these authorities include electric, telephone, oil and gas transmission and distribution line rights-of-way, ski areas, resorts, marinas, water transmission facilities, interstate, State, and county highways.

The impacts of these statutorily-directed terminations would be far reaching. The costs to the public fisc for terminations, prior to the currently agreed upon expiration dates under the language of the agreements, and takings law could involve many millions of dollars. In addition, all such terminated uses could be subject to reconsideration at the same time. The administrative burden of this review could exceed the agency's capacity to analyze and process in a timely manner, as well as place a significant paperwork burden on the holders. Furthermore, the extensive capital investment required to construct and operate these facilities requires a certainty of period of use so that the investment may be financed and amortized.

The USDA believes that its processes currently in effect properly safeguard water quality and accomplish the purpose of S. 1114. The USDA, through the Forest Service, issues all authorizations with language requiring compliance with all applicable water quality standards established pursuant to Federal or State law. This also applies to requirements imposed by Federal legislation subsequent to the date of the authorization. The USDA strongly believes that this requirement is adequate to accomplish the purpose of the proposed legislation. We recommend that section 304(d) be deleted.

The Department stands ready to work with the committee to develop language to address our concerns with S. 1114.

I appreciate the opportunity to testify today and will be happy to respond to your questions.

TESTIMONY OF DOUGLAS K. HALL, ASSISTANT SECRETARY FOR OCEANS
AND ATMOSPHERE, U.S. DEPARTMENT OF COMMERCE

Good morning, Mr. Chairman and members of the Subcommittee. I am delighted by the opportunity to come before you and discuss the role of the National Oceanic and Atmospheric Administration (NOAA) in furthering, and benefiting from, the new approaches for managing our environment proposed in the Water Pollution Prevention and Control Act of 1993 (S. 1114). I commend Senators Baucus and Chafee for introducing a reauthorization package to the Clean Water Act that provides a major advance in our capabilities to manage environmental resources.

To carry out its Federal trustee responsibilities for coastal, marine, and anadromous fishery resources, NOAA has long championed an approach to environmental management that recognizes the integrity of ecosystems as the logical focus for resource management decisions. New authorities for nonpoint source pollution control under the joint stewardship of NOAA and the Environmental Protection Agency (EPA) for coastal zone management have sharpened our interest in the watershed/ecosystem focus. The Baucus/Chafee legislation provides a new framework of national policy within the Clean Water Act that will further progress toward restoring the quality of our Nation's waters. This framework is consistent with NOAA's goals and management responsibilities and will enable better use of NOAA scientific capabilities and technical expertise to meet the needs of resource managers.

Over the past two decades, the Clean Water Act has come a long way in controlling chemical water pollution, one part of the Clean Water Act's overall goal "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." And now we can turn to the last element of the original mandate of the Clean Water Act—to protect the biological integrity of our stream, lake, river, and coastal ecosystems.

NOAA strongly endorses the restatement of the goals and strategies of the Clean Water Act to include protecting and restoring ecosystem health. This shift in perspective from piecemeal and fragmented to comprehensive and integrated will enable us to focus on systematic causes of decline rather than individual impacts. The strategy, which directs management, planning, research, and monitoring efforts on entire watersheds, is particularly critical for the coastal and marine ecosystems under NOAA's stewardship.

I would like to discuss four major themes in the proposed legislation that underpin NOAA's strategic directions for protecting the health of coastal ecosystems. These include the watershed management approach, regional partnerships, stronger controls on nonpoint source pollution, and research and monitoring.

Watershed Management

The watershed management approach in the proposed legislation gives us a first step toward full restoration and protection of living resources, and it should be considered the umbrella under which most other policies of the Clean Water Act are carried out. Of course, in order to be effective, watershed management must go beyond planning. The approach must incorporate adequate means by which to ensure the full implementation of watershed plans.

NOAA strongly supports the addition of a new section to the Clean Water Act for the purpose of encouraging comprehensive watershed management. As the agency responsible for the longterm protection and management of this Nation's coastal and marine resources, NOAA is acutely aware of the effects of activities resulting from poor watershed planning and management, sometimes occurring tens or hundreds of miles inland, on the coastal and nearshore resources. We believe that the greatest long-term threat to the viability of commercial and recreational fisheries, the protection of marine mammals and marine endangered species, and the preservation of our coastal zone, National Marine Sanctuaries and National Estuarine Research Reserves is the continuing loss and degradation of marine, estuarine, and aquatic habitats. These declines are a result of physical alterations, nutrient and toxicant loadings, changes in freshwater flows, siltation, and other human-based environmental problems. More than half of the Nation's original acreage of coastal wetland marshes have disappeared and dramatic declines in seagrass beds have occurred. Louisiana alone loses an estimated 35,200 acres of coastal wetland habitat

each year. Because many of our environmental problems stem from the cumulative effects of development, and other incompatible or poorly planned human activities, a new strategy—based on goals to protect and restore living resources, and which includes full upstream watershed management as well as downstream ecosystem management, planning, research, and monitoring—is needed to turn the tide on coastal degradation.

The concept of watershed management and planning is not new. It is being practiced on a number of levels by many state and Federal agencies. The Administration has formally embraced the development and implementation of watershed planning in the newly released Northwest Timber Plan, geared toward protecting forest and fishery habitats along with the economic needs of the region. While NOAA has been involved in watershed issues on the West Coast for some time through the evaluation of endangered species listings for salmon stocks, this reactive approach is not the best method to address the broader problems of which salmon declines are only a symptom. The reauthorization of the Clean Water Act allows for the establishment of national strategies and specific priorities to undertake comprehensive watershed management in a systematic manner and deal with environmental problems before they become environmental crises.

In conjunction with several existing programs and authorities NOAA has been working to incorporate the principles of watershed protection in the management of marine resources. Within the National Marine Fisheries Service the new Office of Habitat Protection has worked with the Federal/state Chesapeake Bay Program partnership to remove blockages to anadromous fish passage. Electric power utilities in the Susquehanna River watershed have pledged to install by 2000 fish passage facilities at the three remaining dams blocking American shad spawning runs. As we restore spawning runs to formerly pristine rivers, it becomes even more essential to restore the water quality in these areas to support long lost fish populations. Habitat restoration and water quality protection go hand in hand, and watersheds provide the most effective framework for combined planning and implementation efforts.

In addition, twenty-nine states and territories have coastal zone management plans under the National Coastal Zone Management Program which NOAA directs. A number of these states, using grant funds from NOAA, have developed and implemented different versions of watershed management (such as watershed-based local coastal programs and special area management plans) within the context of their state coastal zone programs. The coastal nonpoint programs (discussed later in this testimony) are currently being developed by states and will also be based on coastal watersheds. The goal of a national commitment to watershed planning, with appropriate incentives, as called for in the legislation will provide support to the watershed concept within state coastal zone management programs.

Issues that should be addressed in the development of watershed programs include nonpoint source pollution, cumulative impacts of point discharges, enhanced wetland protection over and above that provided by the Section 404 program, and endangered species. We appreciate the Committee's efforts to provide some policy direction in S. 1114 in order to assist in ensuring comprehensive programs although we believe the specifics should be developed through guidance issued by EPA in consultation with the relevant Federal agencies and resource programs.

Regional Partnerships

The Clean Water Act has fostered many regional programs that bear directly upon NOAA's trust and stewardship responsibilities for fishery habitat and coastal zone management. NOAA participates in Federal/state partnerships coordinated by EPA, in particular the 21 National Estuary Programs and the three Great Waters Programs (Chesapeake Bay, Gulf of Mexico, and Great Lakes).

To restore and protect these coastal waters, all environmental agencies at Federal, state, and local levels must work together and develop restoration and protection goals that are fine-tuned to meet regional needs and concerns. This will depend on each agency using its particular strengths, skills, authorities and institutional arrangements with other stakeholders. NOAA's focus is in its coastal zone, habitat, sanctuary and reserve, fishery management, research, and monitoring responsibilities. The advantages of combining expertise are demonstrated by NOAA and EPA's joint administration of section 6217 of the Coastal Zone Act Reauthorization Amendments. In addition, the partnership approach in the National Estuary Programs and Great Waters Programs builds on each agency's strengths to create truly comprehensive action plans.

NOAA is committed to participating in these ecosystem-based restoration and protection programs. They go well beyond traditional water quality management pro-

grams in that living resources are the ultimate measures of success. NOAA's National Marine Fisheries Service recently opened a Chesapeake Bay Office in Annapolis, located adjacent to EPA's Chesapeake Bay Program Office, to tighten coordination of efforts on the cleanup and restoration of this estuary. Since 1985, our Chesapeake focus has been on strengthening the Federal/state implementation plans on wetlands, submerged aquatic vegetation, fish passage improvement, oyster reef restoration, and fishery management. We have funded major research efforts to design improved fishery surveys, to understand the ecosystem processes and effects related to low dissolved oxygen levels, to study ecological effects of low levels of toxicants, and to monitor algal blooms using aircraft remote sensing. Our partnership with EPA in this program is our model for interacting in other large and small estuary programs.

NOAA's protected area programs—the National Marine Sanctuary Program and National Estuarine Research Reserve Program—complement watershed planning and implementation efforts proposed in S. 1114, and we look forward to continuing our coordination with EPA and other Federal, state and local agencies and the public. In Florida, for example, NOAA is developing an overall ecosystem management plan for the Florida Keys National Marine Sanctuary in cooperation with the State of Florida, EPA, other government agencies, commercial fishermen, environmentalists, recreational user groups, and the public. Both EPA and NOAA are involved in a newly invigorated cooperative effort to integrate the protection of the sanctuary with the larger South Florida ecosystem of which it is a part, including the Everglades.

NOAA is also participating with EPA and the National Science Foundation in the Waquoit Bay, Massachusetts, Land Margin Ecosystem Project. It is examining land uses and nutrient loadings in order to characterize the physical, chemical, and biological processes occurring in the bay and surrounding subwatersheds. Waquoit Bay has been designated by NOAA as a National Estuarine Research Reserve. The scientific data from this project is used by the Reserve staff to develop and disseminate educational information for coastal decision makers, educators, and the general public.

These are the types of regionally based cooperative efforts organized around a specific watershed that will be at the forefront of environmental issues in this country. These initiatives set an appropriate framework for the integrated protection of these and other outstanding natural resource areas and should be an extension of the watershed management approach proposed in S. 1114.

Nonpoint Pollution Control

NOAA believes that tackling the problems of nonpoint source pollution provides an opportunity to have a profound impact on this Nation's coastal environment in the next century. We strongly support strengthening the existing section 319 programs. There has been much work to date on coastal nonpoint programs under section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA). While the Clean Water Act amendments do not need to duplicate CZARA, we believe it is very important that amendments to section 319 of the Clean Water Act be compatible with these programs. Consistency between the state coastal nonpoint programs and the state section 319 programs will undoubtedly bolster both efforts, and will help to address the concerns of the coastal states regarding the contribution of activities in inland states to coastal water impairments. We support many of the approaches found in S. 1114 to increase national attention to the control of nonpoint sources of pollution, because we believe they will support efforts already underway with the coastal states under section 6217 of CZARA.

Passage of CZARA expanded NOAA's role in nonpoint source pollution prevention and control, directing a new effort by the coastal states and territories. The new coastal nonpoint program is administered jointly by NOAA and EPA. Section 6217 requires the 29 states and territories with federally approved coastal management programs under of the Coastal Zone Management Act to develop and implement Coastal Nonpoint Pollution Control Programs. The state coastal nonpoint programs are required to implement best available management measures in conformity with guidance developed by EPA, in consultation with other Federal agencies.

We are now six months into the 30-month statutory time frame for the states to develop and submit their coastal nonpoint programs. We are finding that there is general support for the goals of section 6217, and that, in many cases, the statute complements what many of the states have been trying to do to protect their coastal waters. However, the states also have several concerns which include 1) limited resources available to accomplish the scope and timing of the requirements, 2) achieving water quality standards given the contribution of upstream, out-of-state sources,

and 3) the challenge of developing and implementing controls on sources not traditionally subject to such management.

Despite these concerns, coastal states are making an effort to develop coastal nonpoint programs to meet the Federal requirements. States are also reviewing their existing authorities to assess how they could be used or revised to address nonpoint pollution management. Most states are also undertaking new education efforts to make the public aware of the nonpoint source pollution problem and to generate support for future state efforts.

We also consider the improved dialogue and coordination between coastal management and water quality agencies at the state level, as well as at the Federal level between NOAA and EPA, to be one of the early successes of the program. We would like to see this coordination continue and be strengthened through amendments to section 319. We have additional comments on certain specific aspects of the bill, related to our CZARA responsibilities, that we intend to submit for the record, in response to your July 14, 1993, hearing on nonpoint source pollution.

Research and Monitoring

NOAA believes that any new legislation outlining management from watershed and ecosystem perspectives must include appropriate monitoring and research. To design ecosystem protection goals and objectives effectively, we must be able to define, detect, and understand the meaning of ecosystem health criteria. These challenges are as important and equally as daunting as the challenges to management. Without them, we will not be able to identify real risks, track progress, or adapt management strategies along the way. Each of these is an essential ingredient to economically sound and environmentally effective management.

Several agencies currently conduct research and monitoring activities mandated by statutes other than the Clean Water Act. NOAA, for example, currently invests about \$30-\$40 million annually in water quality monitoring and research as part of its mandate to protect and better understand coastal, estuarine, and Great Lakes ecosystems. Clean Water Act goals can be met more quickly and efficiently by acknowledging these existing programs and ensuring that all related monitoring and research data, information, and expertise from all Federal agencies are coordinated and used where appropriate.

There are many opportunities for NOAA's research capabilities to support the broadened goals of the Clean Water Act, with particular emphasis on understanding and protecting coastal ecosystem health. In response to the clear necessity to understand the impact of pollution on functioning ecosystems, NOAA conducts extensive research regarding aquatic ecosystem structures, functions, and impairments. Specific NOAA research projects range from basic research on aquatic ecosystem structure to solution-oriented investigations aimed at resolving specific problems. NOAA and its academic partners are able to conduct interdisciplinary research programs in all aspects of environmental quality and ecosystem health, including the influences of atmospheric deposition and land use on the integrity of aquatic ecosystems, the response of biological organisms to impaired waters, and the effects of pollutants on whole ecosystems.

In addition, NOAA is conducting research to develop new and more accurate measurements, and techniques such as bioindicators. NOAA is also developing and applying new capabilities, such as the use of Landsat remote sensing data to monitor and detect changes in coastal watershed land-cover and habitats and the application of ocean color remote sensing data to observe water quality-related characteristics such as turbidity and eutrophication. These capabilities could be an integral component of an ecosystem monitoring approach and continued research in these areas is essential.

Our existing network of research and monitoring activities and fishery habitat assessment projects could make a significant contribution to the evaluation and protection of aquatic ecosystems under the Clean Water Act. Efforts to improve water quality criteria to protect ecosystem health could benefit from NOAA's extensive background with ecosystem characterization and evaluation. This is also an opportunity for many elements of NOAA to share their expertise and facilities with regionally oriented programs, including the National Estuary Program and the Chesapeake Bay, Great Lakes and Gulf of Mexico programs.

NOAA's strategy of improving our basic understanding of ecological processes, with a focus on developing the information needed to support decision making, has been employed and refined over a number of years in key locations, including Puget Sound, northern Gulf of Mexico, Chesapeake Bay, New York Bight, Narragansett Bay, and the Great Lakes. For example, the on-going Great Lakes ecosystem program focuses on a range of issues including toxic substances, nutrient over enrich-

ment, habitat modification, water quantity/quality, and physical processes/hazards. This program is interdisciplinary, uses modeling techniques to integrate research results, and is effectively coordinated with programs of other Federal, state, regional, and Canadian agencies.

NOAA's existing capabilities for monitoring the marine environment also offer a considerable opportunity for supporting Clean Water Act goals. NOAA conducts the National Status and Trends Program, a national monitoring program that evaluates the state of contamination of our coastal waters by toxic substances released through human activities and assesses the trends in these conditions. This program has collected data since 1984, long enough to detect national and regional trends in the levels of certain contaminants. The recent National Coastal Monitoring Act of 1992, which mandates the development of a national Federal-state monitoring program to assess the status of coastal ecosystems of the United States, has expanded NOAA's historical responsibilities. NOAA and EPA are currently developing a joint strategy for carrying out the responsibilities mandated by the Act and are working to develop an initial report on the status of coastal systems to be completed this year.

Monitoring and research needs and programs mandated by the Clean Water Act should be coordinated with those of NOAA and other agencies to create a more efficient Federal effort to meet the goals of the legislation. NOAA recommends that there should be an interagency mechanism for coordinating the agencies water monitoring programs. However, we believe that the Clean Water Act should not include a monitoring council that would duplicate existing mechanisms. Rather, we recommend that the Clean Water Act defer to an existing mechanism. At present, NOAA is participating with EPA and other agencies in the Intergovernmental Task Force on Water Quality Monitoring (ITFM). ITFM has proposed an overall Federal strategy for conducting a national water quality monitoring program and a permanent structure for coordinating its implementation. We recommend that the Clean Water Act recognize this or another existing body as the forum to develop a monitoring strategy and design and to establish quality assurance procedures for data and information.

Conclusion

In conclusion, over all, we support the concepts and principles contained in S. 1114. In particular, we strongly support the movement in the Clean Water Act to use biological resources and criteria as environmental indicators for decision making. The holistic approach to management of watersheds will also greatly assist in our efforts to protect fish and wildlife resources from impacts stemming from development in watersheds which drain into coastal waters. Research and monitoring at the ecosystem level are critical to adopting a holistic approach to ecosystem protection and restoration. NOAA offers unique capabilities needed to deal successfully at the ecosystem level in marine, coastal, and Great Lakes environments. Activities of NOAA and other Federal agencies related to the Clean Water Act should be acknowledged in the Act to ensure use of this expertise and information in meeting Clean Water Act goals.

While each of these areas could be further strengthened, such recommendations are more suited for a follow-up legislative report, which we will gladly provide.

Mr. Chairman, this concludes my testimony. I would be pleased to respond to your questions or those of other members of the Subcommittee.

TESTIMONY OF DALLAS PECK, DIRECTOR, U.S. GEOLOGICAL SURVEY, U.S. DEPARTMENT OF INTERIOR

I. Introduction

Mr. Chairman and members Of the Subcommittee, it is a privilege for me to appear before you today as you consider the issues of watershed management and monitoring. My testimony will emphasize those aspects of the U.S. Geological Surveys (USGS) programs that most directly pertain to the objectives of coordination, monitoring and assessment.

The objectives of the Clean Water Act, as well as an evaluation of how well we are meeting those objectives, can only be achieved with the support of good science. Good science, however, requires reliable information to identify and quantify the causes and effects and trends of existing and emerging water-quality problems, and there is general agreement that the information obtainable from existing monitoring efforts still provide an incomplete and fragmented picture of national water

quality and its trends in improving water quality and reducing public health and environmental risks.

These monitoring efforts have certainly contributed to our understanding of water-quality conditions in the country. However, they have not provided the kinds of coordinated, consistent and comparable information necessary to answer the types of regional and national policy and management questions that are facing the Nation. Some of the difficulties in using these data to describe the Nation's water-quality conditions include:

1. Field sampling and laboratory analytical procedures commonly differ among agencies and with time;
2. Water-quality sampling sites commonly are clustered around known or suspected areas of contamination-thus assessments based largely on these data have a potential for substantial bias;
3. Few sites have been sampled long enough and on a consistent enough basis to assess changes in water-quality conditions over time; and
4. Historically, there is a lack of data for potentially toxic trace elements, pesticides, and other organic compounds that are of recent concern.
5. Historically, assessment of trends and changes in public health and environmental risks have not received sufficient attention.

Even so, we believe that improved Federal, State, and local monitoring efforts, together with the new, more broadly-based national assessment programs of the USGS and other Federal agencies, will provide the support needed to achieve the objectives of the Clean Water Act as well as other resource management and environmental statutes, and to evaluate success in meeting those objectives.

II. USGS Mission and Capabilities

Let me now describe briefly some activities of the USGS that support water-quality programs, including those authorized in the Clean Water Act-but first, some organizational background:

Our mission related to water resources is to develop and provide hydrologic information to a wide range of organizations in both the private and public sectors. We assist all levels of government in carrying out a broad spectrum of activities including basic data collection and assessment of the quantity and quality of surface water and ground water. Our programs are carried out in each of the 50 States, Puerto Rico, and the Territories. We maintain close technical ties with State and local governments, and participate currently in jointly-funded water resource investigations involving more than 1,000 formal written agreements that are renegotiated annually. We also provide technical support for about 40 Federal agencies that transfer funds to us to accomplish tasks in support of their respective missions.

III. Coordination of Water-Quality Monitoring

Turning now to the matter of coordinating Federal, State, and local monitoring activities:

Water-data collection responsibilities are dispersed among all levels of government and the private sector. Cooperation and coordination among data collection organizations is essential if this pool of usable information is to be increased. Inter-agency agreements must be reached to establish comparable methods of data collection and laboratory analyses, techniques for quality assurance and quality control, and procedures for exchanging information. The successful establishment of such cooperation promises to greatly improve the availability of reliable and valid monitoring information and water quality and ecological assessments.

The Office of Management and Budget (OMB), recognizing the need to improve the coordination of Federal water information programs and to develop effective working relationships with State and local agencies, Indian Tribes, and the private sector, established the Water Information Coordination Program (WICP) in December 1991 (OMB Memorandum No. M-92-01). The U.S. Geological Survey, through the Department of the Interior, is responsible for implementing this program.

In January 1992, the WICP established the Interagency Task Force on Monitoring Water Quality (ITFM) to evaluate water-quality monitoring activities in the U.S. and recommend improvements. This study was mandated in the OMB memorandum. We are working closely on the ITFM with EPA which chairs the group. The ITFM includes both State and Federal members. A report to OMB of the ITFM's first year's activities outlines a proposal to carry out a national strategy to enhance water-quality activities and to support better management decisions.

Part of the strategy proposes to initiate a Methods and Data Comparability Council to provide guidance on the development of data collection methods and protocols. Representatives of Federal, State, and local agencies, Indian Tribes, and the private

sector are involved with ITFM at the regional and State levels throughout the country to discuss the proposed strategy and to identify the next steps to improving the field coordination of monitoring activities.

The USGS and the EPA are working closely together to support the ITFM. The degree of cooperation we are receiving from other Federal agencies such as the Departments of Agriculture and Defense, NOAA, and State agencies is outstanding. It is gratifying that other agencies afford this coordination a high priority, and I am confident that the Task Force and resulting institutional mechanisms being established by executive action will improve significantly the effectiveness of our monitoring and assessment programs across the board.

IV. USGS Water-Quality Monitoring and Assessment Programs

The USGS has been actively engaged in assessing and monitoring the Nation's water resources for many years. For example, our stream-gaging network began operation over 100 years ago, and ground-water, surface-water, and precipitation data are collected now on a routine basis at over 45,000 sites across the Nation.

We become involved in compliance monitoring as part of our technical assistance activities with Federal regulatory agencies such as the EPA, Bureau of Reclamation, and Corps of Engineers; and in some of our cooperatively-funded programs with State and local agencies. We are not, ourselves, regulators, so our involvement in compliance monitoring is usually limited to network design, the determination of sampling strategies and methods, the choice of laboratory methods and standards, and, occasionally, the construction and operation of gages and observation wells for others.

By contrast, our own status and trends monitoring activity is continuous, comprehensive, generally regional in scale, and oriented toward assessing the resource itself. The purposes of status and trends monitoring are: (1) to understand water quality and the factors that affect it; (2) provide a broad picture over time of the situation in different regions with different land-uses, climates, and hydrologic characteristics; and (3) provide an overall measure of the transport of substances through the surface- and ground-water systems of the Nation. The following six USGS programs have major status and trends monitoring components that directly or indirectly support Clean Water Act objectives:

The Federal-State Cooperative Program has been in operation for about 100 years. This 50:50, jointly-funded program is a unique partnership between the USGS and State, regional, and local governmental agencies to enhance water-resources information nationwide. Although the cooperating agencies provide at least half the funds, the USGS conducts most of the work. The goals of the program are to collect data and develop information, and to use that data and information to appraise the availability, distribution, and the physical, chemical, and biological characteristics of water resources during the conduct of investigations of interest both to the Federal Government and the cooperating State or local agency. Since the early 1970's, the emphasis of Cooperative Program investigations has shifted toward water quality issues such as aquifer contamination, river-quality assessments, the quality of storm runoff, and the effects of coal mining and agricultural runoff on the Nation's waters.

The Hydrologic Benchmark Program, established in 1964, is a network of 58 streamflow and water-quality monitoring stations installed in small pristine watersheds that have experienced little human influence on their hydrologic characteristics. This network provides a baseline estimate of water-quality conditions with minimal point-source or land-use influences, and has been instrumental in the early detection of the effects of acidic deposition on the water quality of certain pristine areas.

The National Stream Quality Accounting Network is a water-quality network of 384 monitoring stations, established in 1973 at the mouths of most of the larger river basins in the country to relate water-quality trends to upstream land- and water uses, and to account for the mass transport of selected constituents from the American continent. Examples of results from this network include the relationships between: (1) point-source controls and fecal bacteria counts; (2) nitrate in streams and atmospheric emissions of nitrous and nitric oxide; (3) nitrate in streams and agricultural activity; and (4) dissolved solids in streams and the effects of climate, geology, and various human activities.

The Acid Rain Program was initiated in 1982. As the lead Federal agency for atmospheric deposition monitoring, the USGS coordinates the design and operation of the interagency National Trends Network, a 150-station network for collecting data on the quality of atmospheric deposition in the United States. This a rural network that reflects regional characteristics of precipitation chemistry without the localized

effects of nearby sources of air pollution. The Acid Rain Program also includes continuing, long-term, more intensive data collection and analysis in 13 representative, sensitive areas to provide a basis for evaluating the effects of acid deposition on lakes, streams, and ground water.

The quantity and quality of water used in the Nation is of vital importance to water policymakers, planners, resource managers, and water users. In 1978, the National Water-Use Information Program was established to determine how much water is withdrawn for use, how much water is consumptively used, the purpose for which the water is used, and how much water is returned to the environment. State-level water-use programs and associated computer information systems have been cooperatively developed in 48 States and Puerto Rico.

Beginning in 1986, the USGS began efforts to test and refine concepts for a National Water-Quality Assessment Program which we refer to as NAWQA. The questions being addressed by the NAWQA program include:

1. What are current national water-quality conditions? In other words, what are the occurrences, concentrations, and loads of specific physical, chemical, and biological measures in selected parts of river basins and aquifer systems, nationwide?
2. Are water-quality conditions getting better or worse?
3. What are the causes of poor water quality?
4. What are the implications of our findings on monitoring, resource management, and regulatory practices?

Major river basins and aquifer systems, referred to as study units, are the principal building blocks of the NAWQA Program. The full-scale program is accomplished through investigation of a set of 60 study units distributed throughout the Nation. The study units are large and range in size from about 1,200 to 45,000 square miles. Collectively, the study units encompasses about 45 percent of the land area of the conterminous United States, and about 60-to-70 percent of the Nation's water use.

NAWQA provides specific water-quality information to those individuals who set policy, write regulations, establish priorities, or manage water resources. For example: results from the NAWQA study conducted in the Yakima River basin showed that concentrations of the pesticide DDT in fish are among the largest measured in the Nation and commonly exceed guidelines for the protection of birds and other fish predators. This finding was somewhat of a surprise because use of this pesticide was banned almost two decades ago. Based on these findings, the Washington Department of Health is conducting follow-up studies to evaluate the potential human health effects of eating fish in the basin, and has issued recommendations to the public that they limit their consumption of bottom-dwelling fish.

Another example is the findings related to the pesticide atrazine in the lower Kansas River basin. This NAWQA study contributed to the decision by the State to establish a pesticide management area in the Delaware River basin in northeastern Kansas. This would decrease concentrations of pesticides to acceptable levels in surface water and ground water by a combination of management and conservation practices.

V. Role of Monitoring and Evaluation in Gauging the Success of the Clean Water Act

We expect that USGS' monitoring and assessment activities will contribute to the Nation's ability to evaluate whether, and to what extent, the programs undertaken pursuant to the Clean Water Act (and other acts) are helping us reduce public health and environmental risks.

VI. Watershed Management

Our only comment on the watershed management provisions of the Clean Water Act reauthorization is technical in nature and relates to the important hydrologic aspects of ground water.

In many watersheds, ground water should be an important component of watershed management strategy. Ground water has been estimated to supply an average of 40 percent of streamflow, nationwide, but in some areas (for example Long Island, the Delmarva Peninsula, or the Sand Hills of Nebraska) the figure may be as high as 95 percent. In developing measures to control and prevent nonpoint sources of pollution, attention should be given to the complex interactions between surface water and ground water, and the extent of ground water influence in a particular watershed system. It is a fact that many remediation techniques that retard or reduce surface-water runoff can cause an increase in ground-water recharge. This only delays rather than eliminates the discharge of pollutants into surface water. Finally, arbitrary time frames that may be enacted to attain standards may not

produce desired results in certain watersheds because polluted ground water may continue to discharge to streams many years after the source of pollution has been eliminated.

VII. Ending statement

Mr. Chairman, that concludes my formal testimony. I would be happy to answer any questions you may have at this time.

TESTIMONY OF MICHAEL J. SPEAR, ASSISTANT DIRECTOR, FISH AND WILDLIFE SERVICE, U.S. DEPARTMENT OF INTERIOR

I appreciate this opportunity to appear before you regarding the role of the Fish and Wildlife Service in the Clean Water Act (Act).

Service Trust Resources Associated with the Clean Water Act

The Service's interests in the Clean Water Act stem from our stewardship responsibilities for endangered Species, migratory birds, anadromous fish and several marine mammals, all of which depend on clean water to survive. A majority of these species also live in wetlands and other aquatic habitats for much of their life histories, and are therefore directly dependent on the success of the Act in achieving its goal of maintaining the biological integrity of the waters of the United States. The Service has trust responsibilities for over 90 million acres of lands in the National Wildlife Refuge system. Clean water is essential to maintain these refuges, as well as to operate our system of National Fish Hatcheries.

In addition to our need to comply with the Act on our own lands and facilities, the Service also has authorities for direct involvement in Clean Water Act activities, including section 404(m) of the Clean Water Act, the Fish and Wildlife Coordination Act, the Endangered Species Act, and the National Environmental Policy Act.

The Service has developed widely acknowledged expertise in the evaluation of man's effect on living natural resources. This expertise lies not only in our research program, but in our network of 70 Ecological Services field stations; 54 Fish and Wildlife Management Assistance Offices; 78 hatcheries; 15 fish health and technology centers; and over 500 National Wildlife Refuges and wildlife management areas. We believe that our authorities, in conjunction with our field expertise, can enhance effective implementation of the law.

Clean Water Act Issues

Since it was first passed in 1972, the Clean Water Act and its subsequent amendments have resulted in substantial improvements in the quality of the Nation's waters and a reduction in the rate of loss of our Nation's wetlands. We believe the programs established in the Act are sound, but, as with any program, can be improved.

The goals of the Clean Water Act are "to restore and maintain the chemical, physical and biological integrity of the Nation's waters". In the past, implementation of the Act has focused on the chemical integrity of the Nation's waters, with less effort on biological and physical integrity. This focus is changing, and we are ready to assist the Environmental Protection Agency (EPA) by providing technical assistance and consultation on a variety of biological resource issues. One reason why we are committed to provide this assistance is because of our strong belief that effective implementation of the Clean Water Act can help prevent the need for further listings of threatened and endangered species.

At present, 97 of the 775 species of freshwater fish native to the United States are listed as endangered or threatened, along with 63 mussel species, 12 crustaceans and 11 amphibians. The Service also maintains a list of candidates for potential listing which includes an additional 157 native fish, 59 species of aquatic mussels and 60 amphibians. Clearly, if the status of these species is an indicator, the biological diversity of the Nation's aquatic systems is still being threatened. It is smart both ecologically and economically for our society to make every effort to prevent species from reaching such desperate status as to require listing as threatened or endangered. As Secretary Babbitt has frequently noted, managing an entire ecosystem for harmonious development is economically far more prudent than having to undertake drastic measures to save an endangered species that will have serious economic impacts on that ecosystem.

One means to prevent this is by protecting wetlands. The protection and restoration of the Nation's wetlands are essential to meeting the goals of the Clean Water

Act, not only because they are key components of hydrologic systems, but because of their particular importance to living biological resources. Many freshwater, anadromous and estuarine fish species, more than 50 percent of North America's migratory birds, and more than one third of all threatened and endangered species are dependent on wetlands. The Service can assist more effective implementation of section 404 of the Act through expertise gained during a long history of wetlands inventory, protection, restoration, monitoring and management activities.

In the same vein, the Service's biological expertise and the Department of the Interior's hydrological expertise can be used to enhance development, review and implementation of Federal water quality criteria and State water quality standards. The Service's goal is to resolve potential conflicts between proposed alterations of habitat and the resources we hold in trust for the public. With early coordination, problems can be identified before they reach a level too difficult to resolve. For instance, setting protective water quality standards, and writing Section 402 and 404 permits that are consistent with those standards, may be more cost-effective and better for the environment than seeking remediation of contaminated sediments after the discharges and releases have essentially ceased.

Preventing further degradation of waters of the United States, through more effective implementation of antidegradation policies, and through protection and expansion of Outstanding National Resource Waters are also important to meeting the goals of the Clean Water Act. Maintaining high quality waters will help maintain the aquatic resources that live in them.

Effective management of our aquatic ecosystems requires a watershed-based approach to program planning, monitoring and assessment. The Service has been involved in numerous watershed-wide fish and ecosystem restoration efforts around the country, such as the Great Lakes lake trout restoration, and watershed restoration activities on the Clinch River, Virginia and Chehalis River, Washington. From these experiences, we have learned the value of taking a landscape perspective in management activities, and can lend our experience and expertise in any watershed or river basin planning activities that may be established in the future.

Water Quality

Our Division of Environmental Contaminants is obtaining data on the health of trust resources across the nation. These investigations have provided us insight into the "biological integrity" of the Nation's waters and have helped identify where additional emphasis on Clean Water Act activities may be needed. Let me share some examples of our effort. During a recent Clean Water Act Reauthorization Hearing, Senator Baucus commented on continuing threats posed by persistent, bioaccumulative toxic compounds in the Great Lakes ecosystem and other areas of the country. He referred to reports of continuing impacts on trust resources of the Service, including reproductive effects such as bill and leg deformities, endocrine disruption, and embryo mortality in migratory colonial waterbirds.

Our ongoing investigations in the Great Lakes watershed have confirmed that certain contaminants continue to threaten colonial waterbirds, as well as Bald Eagles, with reproductive impairments including deformities and other developmental problems. This Spring, while monitoring eagle reproductive success, our field personnel located three nestling eagles with beak defects common to colonial waterbirds nesting in the Lakes.

I have brought an enlarged photograph of one of these eaglets showing its deformed beak. These young birds have been collected and are undergoing further evaluations. We have found that adult eagles which feed on Great Lakes prey have lower reproductive success than eagles feeding on inland lakes and rivers. Eagles nesting along the Great Lakes continue to have significantly higher levels of several contaminants measured in their blood and dead egg samples than inland eagles.

The problem is widespread across the Great Lakes and requires a basinwide, watershed approach to seek additional reductions in persistent contaminants from significant contributing sources in a cost-effective manner. The Service has been working with the EPA and the States on a variety of fronts, including the Great Lakes Initiative which is addressing wildlife water quality criteria guidance. This coordination should assist in development of protective and restorative actions to be instituted regarding these continuing biological problems.

In addition to wildlife, fish are also still being affected by contaminants in waters and sediments. In a recent article in *The Washington Post* (Monday, July 12, 1993) entitled, "Medical Detective Finds Clues on Cancer Among Fish and Pollution" John Harshbarger, the head of the Registry of Tumors in Lower Animals at the Smithsonian, stated that, "all the evidence supports the idea that if you find liver cancer in fish, it's caused by chemicals."

The article notes that liver cancers have been found in at least 18 species of fish that live and feed primarily near the bottom of lakes, streams, and rivers. Some of these findings are the result of studies conducted by Service field investigators in our Ecological Services and Research programs. Investigators have found tumors in fish from many polluted waterways, including: the Buffalo, Niagara and Hudson rivers in New York; the Cuyahoga and Black rivers in Ohio; the Elizabeth and York rivers in Virginia; Black Rock Harbor near Bridgeport, Conn.; Narragansett Bay, Rhode Island; New Bedford Harbor and Quincy Bay in Massachusetts; and Puget Sound in Washington state.

Refuge Lands

Our National Wildlife Refuges are being directly impacted by water quality problems. A few examples include:

- Salton Sea National Wildlife Refuge—Based on shoreline surveys, aerial surveys and clean-up efforts in 1992, an estimated 150,000 eared grebes had died (about 8% of the North American population). Contaminant analyses of eared grebes indicated elevated levels of selenium, mercury, DDE and chromium in eared grebe livers, when compared to previous samples from the Salton Sea. Selenium has increased over 200 percent in three years. All liver samples from dead, sick, and healthy (defined by normal behavior) eared grebes had selenium levels above threshold levels known to cause adverse impacts. Endangered species that may be at risk include the Yuma clapper rail, California brown pelican, desert pupfish, and peregrine falcon. Adverse effects on the reproductive success of the eared grebe may be expected as a result of documented elevated concentrations of selenium and DDE. Elevation of selenium and mercury may have contributed to the die-off indirectly by compromising the birds' immune systems.
- Wheeler National Wildlife Refuge—Over 400 tons of DDT and metabolites are in bottom sediments of Huntsville Spring Branch located on the refuge.
- Eutrophication of water bodies located on various refuges, including Buffalo Lake on the Buffalo Lake National Wildlife Refuge, Texas; Camas wetlands on the Camas National Wildlife Refuge, Idaho; and the Bear River, which runs into the Bear Lake National Wildlife Refuge, Idaho. Eutrophication is the process by which a body of water becomes over-enriched with nutrients and sediments. This results in a plant populations explosion, causing serious degradation of water quality, extreme changes in species composition, and alteration of beneficial uses.

Wetlands Regulation

Prior to the 1970's, the average annual loss of wetlands was approximately 450,000 acres. Between the mid-1970's and mid-1980's, this loss rate was reduced to approximately 290,000 acres per year, and further reductions in the rate of loss have probably been realized since the 1980's. Although there is no question that enactment of section 404 of the Clean Water Act and the Swampbuster provisions of the 1985 and 1990 Farm Bills have contributed to this positive trend, wetlands destruction continues at an alarming rate. Yet less than half of the historic wetlands of the lower 48 states remains, and a significant portion of what remains is significantly impaired. These factors have contributed to the progressive impoverishment of our biotic systems.

I would like to provide you with two examples of how wetland habitat losses, like other Clean Water Act-related issues, have affected species populations the Service is entrusted to protect.

Bottomland Hardwood Forests. Bottomland hardwood forests are in greatest abundance in the Lower Mississippi River Valley, which once supported the largest expanse of forested wetlands in the United States. Of the 24 million acres of forested wetlands which formerly existed in this region, less than 22 percent remained in 1978, and only 20 percent were projected to remain by 1991. Most of these losses have been due to pre-Swampbuster era conversion of forested wetlands to farmlands through drainage and landclearing.

The Louisiana black bear, listed as "threatened" under the Endangered Species Act, historically inhabited the bottomland hardwood forests of Louisiana, southern Mississippi, and eastern Texas. It is dependent on the maintenance of large tracts of high quality bottomland hardwoods, as well as forested corridors to connect those tracts. Landclearing for agriculture and other purposes reduced this species habitat by nearly 80 percent, thereby necessitating its listing as threatened in 1991. At present, the Louisiana black bear's range is restricted to small populations within

the bottomland hardwoods of the Tensas and Atchafalaya River Basins of Louisiana, and scattered populations in Mississippi.

Vernal Pools. California's vernal pool wetlands have sustained a significant and continuing loss from agricultural conversion, flood control activities, and residential/commercial development activities, much of which is currently being authorized through nationwide general permits. As a result, by 1978 it was estimated that 90 percent of the original vernal pool habitat in the Central Valley had been lost. More recent estimates place this loss figure at nearly 99 percent.

As a consequence of these losses, there has been a corresponding decline in the abundance and diversity of plant and animal species dependent on vernal pool wetlands. Currently, ten California vernal pool plant species are listed as endangered, while 55 rare vernal pool plant species are designated as candidates for possible Federal listing. In addition to plants, five freshwater invertebrate species restricted to vernal pools are now proposed for listing as endangered. Many more vernal pool species are likely to be added to the Federal list as threatened or endangered if losses of these wetlands are not curtailed.

There are a variety of mechanisms through which the loss or degradation of wetland habitats I have described has continued to occur. Many activities have not, in the past, been regulated under the Clean Water Act, such as discharges associated with landclearing, ditching, channelization, and other excavations in wetlands. In addition, unauthorized activities frequently go unobserved. Finally, there are the adverse effects of land use practices adjacent to wetlands and other aquatic habitats, such as stormwater and other runoff from agricultural, municipal, and industrial sources, which significantly impair wetland functions.

Since its inception, the section 404 regulatory program has substantially reduced the harm to wetlands and other aquatic habitats due to development activities. Nevertheless, losses to fish and wildlife resources continue in spite of the program. In order to attain a greater degree of protection, and truly minimize, if not avoid, net habitat losses, we must take a much broader view of what is needed to meet the goals of the Act, and recognize that wetlands protection must always be a part of this approach.

I would like to close by commending the Committee for providing us this opportunity for discussion of future directions of the Clean Water Act. I would reiterate that the Service has a major role to play in the successful implementation of the Clean Water Act. We have a substantial land base that is directly regulated and affected by Clean Water Act programs. Thus, we are committed to managing our lands and other trust resources in a way that fulfills the goals of the Clean Water Act. Our field force stands ready to provide technical assistance and consultative services to EPA and the States in meeting trust resource responsibilities.

We look forward to continuing our collective efforts with this Committee, the Environmental Protection Agency, other Federal agencies and the State agencies in improving the Clean Water Act.

TESTIMONY OF ROBERT H. WAYLAND, III, DIRECTOR, OFFICE OF WETLANDS, OCEANS, AND WATERSHEDS, ENVIRONMENTAL PROTECTION AGENCY

Good morning, Mr. Chairman and Members of the Subcommittee, I am Bob Wayland, Director of the Office of Wetlands, Oceans, and Watersheds within the U.S. Environmental Protection Agency's (EPA's) Office of Water. My testimony today will address three topics: water quality monitoring, federal coordination, and water conservation.

MONITORING

Water quality monitoring is the means by which we know the physical, chemical, and biological condition of our waters, and the effectiveness of actions undertaken under the Clean Water Act (CWA) or other laws for improving water quality. Through scientifically-valid monitoring, we detect water quality problems, ascertain if our waters are meeting societal goals such as State water quality standards, design protection or remediation measures Where necessary, and measure the effectiveness of our programs over time. Monitoring is our continual feedback loop, essential to set strategic planning goals and agency directions, direct resources and set informed program priorities, and measure how well strategic goals are met.

Monitoring and information management activities are critical at all levels of water management—at an individual stream or estuary, at a discharge facility or on a farm, in a watershed, or at a State or national program level. To manage and

to monitor well, and to evaluate, it is essential to set strategic goals and to articulate the environmental results we desire.

Strategic Planning/Environmental Indicators

In EPA's water programs we are well advanced in our strategic planning process. Monitoring information is the cornerstone of our efforts. We begin with monitoring information to tell us what physical, chemical, or biological water quality problems are preventing us from reaching the strategic goals we set, and we end with monitoring to evaluate if our management programs have resulted in the environmental improvements we seek.

To measure if we are meeting our strategic goals, we have chosen specific environmental indicators. Environmental indicators are identified data or sets of data that we can measure and that clearly communicate information to managers and the public. For instance, one of our goals is to conserve and enhance ecosystems, and the indicator for that goal is the health of the fish and the insect communities that live in and on the water.

We collect data to measure our environmental indicators, but much useful data is also collected by other Federal, State, local, and private partners. It is therefore critical to us to work closely with other programs and agencies to use comparable collection and quality assurance/quality control methods, link our data Systems, and employ new technologies such as Geographic Information Systems and remote sensing.

Range of Programs

A large number of water quality monitoring programs are mandated by the CWA and by other statutes and agency missions. These monitoring programs cover a wide range of activities: data collection to fulfill specific objectives; data analysis with appropriate levels of confidence; information storage and retrieval; and, analysis and reporting to decision makers. Information from these monitoring efforts is essential to initiate, assess, and improve our management efforts.

Water quality monitoring programs are complex and the many activities included must be tailored to meet clearly specified and differing objectives such as compliance, ambient water quality, trends, or problem identification monitoring. The monitoring picture is made more complex because many Federal and State agencies monitor for a wide range of purposes, as do local, private, volunteer, and business and industry groups. Experience has shown that properly trained volunteers can perform basic sampling and simple analytic tasks with accuracy and reliability while keeping expenses low. This program has proved to be an excellent method for educating the public and fostering the stewardship of waterbodies, particularly estuaries.

There are several major Federal monitoring programs to measure status and trends regarding the quality and quantity of the nation's waters for specific purposes, such as EPA's Environmental Assessment and Monitoring Program, the National Water Quality Assessment Program of the U.S. Geological Survey (USGS), the National Oceanographic and Atmospheric Administration's (NOAA) National Status and Trends Program, and the U.S. Fish and Wildlife Service's Wetlands Status and Trends Program and new Biomonitoring of Environmental Status and Trends Program, among others. Although mandated by statutes other than the CWA, the information generated by these and other activities provide important information to support CWA goals. For example, the USGS focuses on quantity and quality of water resources, with particular emphasis on hydrologic and geochemical processes and the impacts of natural and human factors on water quality. The Department of Agriculture investigates the impacts of agriculture and forestry practices on water quality. NOAA monitors coastal waters to assess status and trends of coastal water quality. The Fish & Wildlife Service monitors changes in the physical acreage of wetlands over time as well as the status and trends of wetlands. The goals of the CWA will be best met by our continuing use of the wide range of water quality related information generated by all Federal agencies.

In addition, States, Territories, Tribes, municipalities, industrial dischargers, volunteer groups and private organizations have their own ambient and compliance monitoring programs. It is essential to use our limited resources wisely by asking the right questions before we monitor and by sharing data gathered by these many complementary programs.

Federal Leadership: Monitoring and Information Systems

We are committed to compatible and well coordinated water quality monitoring programs. We showed our leadership when, in January of 1992, EPA and USGS es-

established a three-year Intergovernmental Task Force on Monitoring Water Quality (ITFM). The ITFM includes EPA, USGS, eight other Federal agencies, and ten State, Interstate, and Indian government organizations. The group is chaired by EPA. USGS is the Vice Chair and Executive Secretariat. The ITFM is part of the Interdepartmental Water Information Coordination Program administered by the USGS under OMB Memorandum 92-01.

The ITFM has a workplan and outline of products for five major problem areas in monitoring: institutional collaboration; environmental indicators; field and laboratory methods comparability; information management and sharing; and assessment and reporting. It recommends a five-pronged national strategy to address these problem areas. The strategy includes such specific products as environmental indicators to ascertain if water quality standards are being met, an outline for an optimal monitoring program, and creation of a National Water Quality Monitoring Council to coordinate Federal, State, private and volunteer efforts nationwide.

In this context, I would like to highlight the importance of linking the various information systems that store, retrieve and facilitate assessment of monitoring data. Most Federal agencies have their own information systems to store their program's data and to meet their specific objectives, and most agencies can benefit from using data from other systems. For instance, EPA's system, STORET, which is the country's largest water quality data base, includes water quality data from States and other Federal agencies as well. As an example, one-quarter of the information in STORET is from USGS and they provide monthly updates. As EPA modernizes STORET, we are committed to do so working closely with USGS which is also modernizing its water information system, called NWIS-II. NWIS includes data on both water quantity and quality. Through the ITFM the other Federal and State agencies are trying to ensure that a large number of new and existing data systems can share information more easily.

With this as background, let me applaud the efforts of S. 1114, the "Water Pollution Prevention and Control Act of 1993", to acknowledge the importance of monitoring in our water management efforts and increase the effectiveness of monitoring nationwide.

State Monitoring Programs

We are pleased to see the bill give deserved prominence to State monitoring programs, and the opportunities for States to also use information generated from Federal, discharger and volunteer monitoring programs. We support the Senate's call for minimum State water monitoring programs. Stronger State programs will help to target CWA programs to the impaired waterbodies which need the most attention and to help protect areas that meet water quality standards. Strong and more complementary State monitoring programs will generate a more uniform nationwide water quality assessment and allow us to aggregate State information into a better national picture in our reports to Congress. In addition, stronger State water quality monitoring programs, including both ambient and compliance monitoring, will help the States, EPA, and other Federal agencies do a better job of determining on a national and regional level whether our management and control programs are achieving the environmental results we seek. In addition, stronger State programs will allow us to begin to address gaps in current monitoring. We must recognize, however, that the stronger State water quality monitoring programs called for in S. 1114 will significantly increase State costs while, in general, State monitoring programs have been reduced over the last several years, due to cuts in federal and State program support and increased mandates in other areas.

We also support the provision in S. 1114 which would change the State and Federal water quality reporting cycle from two to five years. A five-year cycle will help the States better integrate their monitoring and abatement programs on a watershed basis. We support S. 1114's recognition of the importance of volunteer monitoring. These committed volunteer groups can provide quality-assured water resource data and help States accomplish monitoring objectives. Similarly, the recognition that dischargers should in some circumstances contribute significant information on ambient water quality is laudable.

Water Quality Monitoring Coordination

We wholeheartedly agree that there needs to be a mechanism to ensure Federal, State, local, private, and volunteer monitoring programs are fully coordinated. We strongly encourage use of existing coordinating mechanisms. We have shown our commitment to coordination through the ITFM, which has exhibited an impressive level of interagency cooperation to produce a national strategy for better monitoring of all water resources, including rivers, streams, lakes, ground waters, coastal

waters, associated aquatic communities and habitat, wetlands, and sediment. The ITFM has already Proposed a national monitoring strategy and a permanent structure for coordinating its implementation. As ITFM is part of USGS's Water Information Coordination Program, its recommendations have received wide agency approval at the highest management levels.

The ITFM is addressing all of the elements of S. 1114 and more. We should build on existing efforts, not duplicate them. We therefore question the need to establish a Water Quality Monitoring Council in the law as proposed by S. 1114. Among other reservations, I note that the Federal, State and other members of the Council Proposed by S. 1114 are Substantially less inclusive than our current ITFM, and the ITFM also addresses the important problem of comparability of field and laboratory methods, which S. 1114 does not.

Relationship to Other Federal Research and Monitoring Activities

We believe S. 1114 should recognize the value of other agencies' research and information in achieving CWA goals. Different statutes such as the Coastal Zone Management Act, the Safe Drinking Water Act, the Marine Protection, Research, and Sanctuaries Act, the Water Resources Development Act of 1992, and the National Coastal Monitoring Act mandate water-related research programs in EPA and many Federal agencies. The Water Resources and Coastal Ocean Science Subcommittees of the Federal Coordinating Council for Science, Engineering, and Technology coordinate research among all Federal agencies. The CWA should provide for close coordination with these other programs where appropriate to achieve CWA goals. This will also minimize conflict arising from separate research mandates in other legislation.

FEDERAL COORDINATION

The foregoing discussion on monitoring provides an excellent example of effective interagency coordination on issues relating to water quality. Other examples abound in water programs administered by EPA. We have long recognized that, in order to be effective in protecting and maintaining our nation water resources, the federal government must provide the leadership in adopting an integrated approach to water management. Coordination and consistency among federal agencies is essential, and, as you know, will be no small task. It would involve 18 agencies in seven departments, and seven independent agencies with 25 separate water programs and some 70 separate appropriations accounts. We are beginning to forge the working relationships that will allow us to provide this leadership. I would like to give you a number of examples.

Policy and Program Development

Coastal America is a collaborative, multi-agency effort to solve environmental problems along the Nation's shoreline. Problems include the loss and degradation of habitat, pollution from nonpoint sources, and contaminated sediments. All three are contributing to species declines and severely damaged habitats. This combined effort originally involved the U.S. Army Corps of Engineers (COE), EPA, U.S. Fish and Wildlife Service (FWS), U.S. Geological Survey (USGS), the Minerals Management Service (MMS), National Oceanic and Atmospheric Administration (NOAA), USDA, the Department of Transportation, and the National Park Service (NPS). More than a dozen agencies now participate in the Coastal America process. Through a series of relatively small scale projects, Coastal America provides examples of successful projects and demonstrates new approaches to addressing coastal living resources concerns in seven geographic regions.

We are also using an interagency process to attempt to resolve some of the especially complex and controversial issues associated with the wetlands program. Our goal is to provide clarity and consistency in federal wetlands policy. As directed by Congress, EPA has initiated a wetlands study by the National Academy of Sciences. To assist with this study, a federal committee composed of EPA, U.S. Department of Agriculture (USDA), the COE, and FWS are working together to ensure that consistent policy and programs will be the outcome of these efforts.

EPA is working with many other federal agencies, at both Headquarters and Regional levels, to provide momentum for the watershed management approach. We strongly believe that coordination among Federal agencies is necessary to plan and execute an effective nationwide watershed management effort. In March of this year, EPA and 12 other federal agencies (including four agencies from the Department of the Interior, three from USDA, the Federal Highway Administration, COE, Tennessee Valley Authority, and NOAA), local sponsors, and numerous nongovernmental groups put together a major conference—Watershed '93. More than one

thousand people participated in the conference, including representatives from forty two States, Puerto Rico, Canada, South Africa and the United Kingdom, representing citizens and environmental groups, regional and federal agencies, and business and industry. The conference examined numerous successful watershed management projects and generated tremendous enthusiasm and momentum to redirect our programs and energies toward a locally driven watershed management approach.

The Coastal Zone Act Reauthorization Amendments of 1990 required EPA to develop "Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters" in order to assist state and local governments, as well as landowners and operators, in identifying and implementing the most effective management measures to prevent and control nonpoint source pollution. The guidance reflected substantial contributions from USDA's Soil Conservation Service (SCS), Extension Service, and U.S. Forest Service, as well as NOAA, the FWS, other federal agencies, and experts from state water quality and coastal zone management agencies.

Program Implementation

The National Estuary Program (NEP) exemplifies the watershed management approach and the potential for coordination among federal and nonfederal stakeholders. The goal of the program is to protect and improve water quality and enhance living resources. The NEP identifies nationally significant estuaries threatened by pollution, development or overuse, and requires Comprehensive Conservation and Management Plans (CCMPs) to ensure ecological integrity. A management conference is convened in each NEP with a wide variety of stakeholders, who are responsible for identifying the problems and developing a CCMP to be implemented by participating parties. Representatives of federal agencies often serve on Management Conference committees. All federal agencies have the opportunity to review the water quality management plan on a continuing basis to determine whether any of their projects or programs potentially assist or conflict with the goals of the plan. As part of the estuary program, for example, EPA works closely with NOAA to assess current coastal conditions and determine whether conditions are improving or deteriorating. NOAA contributes important scientific information that is now being used by the NEP management conferences. The Food and Drug Administration shares its expertise in assuring the safety of fish and shellfish, and representatives of virtually every other agency have been actively involved in planning and implementation activities.

The Great Water Bodies Programs take a comprehensive, geographically targeted approach and all include smaller scale watershed projects as an important part of their overall efforts to restore and protect their waters. At yesterday's hearing, we discussed the Chesapeake Bay, the Great Lakes, and the Gulf of Mexico programs in some detail. I would like to highlight aspects of these programs that illustrate growing federal agency cooperation and coordination.

The Chesapeake Bay Program has not only been at the forefront of federal/state cooperation, but also has established a framework for cooperative work by federal agencies. EPA has ten formal Memoranda of Understanding with other federal agencies to specifically facilitate cooperation within the Chesapeake Bay Watershed. The Poplar Island Restoration Project, currently in its planning phase, is an example. Poplar Island, located off Maryland's Eastern Shore, once encompassed several hundred acres of forests, wetlands, and shoreline habitat, and provided valuable fish and wildlife habitat. The Island has eroded into several small remnants, and is in danger of disappearing entirely. Through the cooperative efforts among EPA, FWS, COE, NOAA, and the State of Maryland, clean dredged material from Baltimore Harbor approach channels, that would have been disposed in a nonproductive manner, is now planned for transport to Poplar Island and placement in order to restore valuable habitat.

The Bay program has also given high priority to the creation of fish passages for anadromous species of fish, e.g., shad, herring, and striped bass, and catadromous species, e.g., American eel. Thousands of miles of Spawning habitat within the Bay watershed have been closed to these species, many by dams built two centuries ago. A concerted effort begun in 1988 by EPA, NOAA, FWS, DoD, Maryland, Pennsylvania, Virginia, and the District of Columbia, as well as private organizations, has already opened up 174 miles of historic migratory fish spawning and nursery habitat. Fifty more miles of habitat are projected to be opened up this year, and hundreds of miles in the next few years. In addition to the economic value to commercial and recreational fisheries, these migratory species can play a significant ecological role for the entire Bay ecosystem.

The Great Lakes Program is another excellent illustration of interagency cooperation. EPA joined agencies that have stewardship responsibilities for the Lakes in developing a shared five-year strategy and in carrying out "on-the-ground" projects which rely on multi-agency teamwork. Notable examples include: (1) the Assessment and Remediation of Contaminated Sediments program to assess contaminated sediments and test remedial technologies (COE, the Bureau of Mines, and the Bureau of Land Management); (2) the Green Bay mass balance study, which addressed the role of bottom sediments in ecosystems contamination (NOAA, the Coast Guard, USGS, as well as co-leader Wisconsin and the Michigan Department of Natural Resources); and (3) an EPA and FWS fish monitoring program that has yielded a long-term perspective on contaminants in lake trout.

The Gulf of Mexico Program has been the catalyst for many cooperative projects. One pervasive problem in the Gulf is the high level of bacteria in the near shore waters from inadequate disposal of human waste. This is often the reason that shellfish beds must be closed to harvest. EPA, FDA, and the coastal states are working together to find ways to address this problem, which is often caused by leaking and inadequate septic tanks. FDA and EPA are sponsoring educational programs and demonstration projects of appropriate technologies and have also convened a workshop to discuss standardizing Septic tank operations and maintenance requirements Gulfwide. In addition, EPA, FWS, and the Texas Parks and Wildlife Department have established the Gulf Ecosystem Management Sites (GEMS) program to identify and protect habitats, including those used by threatened or endangered species; fish nurseries; and rare and threatened habitats, such as mangrove swamps and submerged aquatic vegetative areas.

At the smaller watershed management level, EPA has experienced successful working relationships with other federal agencies around site-specific problems. I would like to provide you with just a couple of illustrations.

The Canaan Valley Watershed is a unique combination of fragile wetland ecosystem, drinking water source, prime trout-fishing stream, vacation home and recreational development, and an annual major off-road vehicle race. In 1975, the Canaan Valley was designated a National Natural Landmark. EPA, the COE, USGS, FWS, SCS, and many state, local and private organizations are active partners in the watershed management process initiated in 1990.

Federal and state agencies are involved in the Upper Arkansas River Watershed Initiative in Colorado. Stressors to the watershed are associated with past mining practices, erosion of rangeland, loss of riparian and wetlands areas, and hydrologic modification. A 1989 technical study of the basin revealed that improved coordination among agencies would be essential in tackling water quality problems. Initially, EPA signed a Memorandum of Understanding with the Colorado Departments of Health and Natural Resources, and the Bureau of Reclamation. Subsequently, other federal, state and local organizations have become part of the Watershed Initiative Team. These agencies include: BLM, Bureau of Mines, FWS, the Forest Service, USGS, and SCS.

Even in our staffing arrangements, we have begun to realize the importance of obtaining interagency cooperation and coordination as well as obtaining multidisciplinary perspectives on shared issues. Toward that end, EPA and other federal agencies and departments have established full-time interagency liaison positions. For example, the U.S. Forest Service has two liaisons in EPA's Headquarters offices, and four in EPA's Regions, one at the Chesapeake Bay Program office, one with the Puget Sound Cooperative River Basin Study Team, and one in EPA's Montana field office. NOAA and USFWS have complete offices in Annapolis, Maryland to coordinate directly with EPA's Chesapeake Bay Program. The Soil Conservation Service also has a liaison with EPA's Headquarter's office and liaisons in all of EPA's 10 Regions. The liaison position has not only improved the process of communication among federal partners, but also has proven to be invaluable in understanding other federal perspectives on environmental issues. Consequently, the opportunity for resolutions on complex issues has increased substantially through this staff position.

The wetlands program in EPA's Region III (VA, MD, PA, WV, DE, D.C.) is, in part, implemented through a series of Memoranda of Agreement with the FWS, COE, National Marine Fisheries Service, and the FHA. Thus, we have obtained a broader and more coordinated perspective toward wetlands, integrating the permitting process and achieving compliance with the National Environmental Policy Act via the environmental impact statement process.

WATER CONSERVATION

S. 1114 also addresses water conservation, which it proposes to promote by coordinating federal policies, authorizing technical assistance to public agencies, and establishing a national information clearinghouse. Up to \$10 million per year is authorized for this effort.

In general, EPA supports the intent of the water conservation provisions of S. 1114. By using water more efficiently, we can both prevent pollution and reduce the need for and cost of water supply and wastewater treatment facilities. Thus, water conservation can be a very cost-effective approach to addressing significant water quality problems. Economic and environmental benefits of water conservation include reducing industrial pollutants through recycling, reducing the need for new water supplies, protecting aquatic habitats (because using less water helps maintain streamflows), and conserving energy used to pump, treat and heat water. Several recent studies, including the report of the Working Group on Water Infrastructure, Water Quality 2000, and the Long's Peak Working Group, have all pointed to the importance of more efficient water use in maintaining our nation's water quality.

I am pleased to see an emphasis on technical assistance and information transfer in the bill. As infrastructure capital costs increase and the availability of sites for water supply and wastewater projects decreases, I believe we will see information needs for water conservation and its relationship to water services planning grow exponentially over the next several years. Municipalities, utilities, States, businesses, and industries urgently need reliable information on cost-effective water conservation technologies and practices as part of their overall water resources planning. EPA has already taken steps to initiate a national clearinghouse of water efficiency information to help fill these information needs. We also applaud the bill's voluntary approach to water conservation set forth in section 403 of S. 1114, and we support the requirement in section 205 of the bill that pollution prevention plans address water use efficiency. At present, encouraging water conservation and integrated resources planning first through better coordination, technical assistance, and information transfer, as this bill does, is our preferred approach. We also recommend that the Committee consider an additional approach: allowing some limited eligibility of SRF funds for water conservation programs that can reduce the need for costly wastewater infrastructure.

Let me take a few moments to update you on some of EPA's water efficiency activities. I have already mentioned the national clearinghouse that we are planning to initiate this Fall. We are also very excited about a voluntary partnership program with the commercial and institutional sector that we recently introduced. The program is called Water Alliances for Voluntary Efficiency (WAVE) and will initially focus on the lodging industry. Similar to other EPA "green" programs, WAVE partners will voluntarily commit to making water efficiency improvements in exchange for technical assistance and favorable publicity EPA will provide. Although the program is just a few months old, EPA has already signed agreements with six major hotel chains, which comprise over ten percent of the hotel rooms in the United States.

We are also helping to define and promote the concept of integrated resource planning as it relates to water resources. Integrated resource planning emphasizes a multi-disciplined, participatory approach to decision making, as does the watershed management approach, and takes into account both water supply and demand management options. We have sponsored, with the American Water Works Association, several roundtables and workshops on the subject. Based on this experience, we urge the Committee to consider the relationship between integrated resource planning and the conservation provisions of Section 403 of the bill.

To help coordinate federal water conservation activities, we have held a series of workshops with representatives of a number of federal agencies to promote water efficiency in federal policies, programs and facilities. Lastly, we have awarded close to \$1.5 million over the last several years in small incentive grants to stimulate interest in and understanding of water efficiency. Projects include research, demonstration, outreach, and the development of tools to aid local governments implement water conservation programs, and workshops such as one on the role of water efficiency in State programs sponsored by the National Governors Association.

In closing, I thank the Members of the Subcommittee for this opportunity to discuss some of EPA's extensive efforts in working with our federal agency partners. We intend to expand these efforts in the future to ensure that our policies and programs are clear, consistent and effective.

TESTIMONY OF JAYETTA Z. HECKER, DIRECTOR, RESOURCES, COMMUNITY, AND ECONOMIC DEVELOPMENT INFORMATION SYSTEMS, GENERAL ACCOUNTING OFFICE

Chairman Graham and Members of the Subcommittee:

I appreciate this opportunity to discuss work we conducted to assist the Subcommittee in its deliberations on the reauthorization of the Clean Water Act. As you know, we have conducted numerous reviews of EPA's water programs over the years to assist in Congressional oversight and to offer recommendations for improving program management. More recently, we have focused on the collection, management, and dissemination of water quality related data. As it has for several of its other environmental missions, EPA has been given leadership responsibility for ensuring the integrity of the nation's water resources. Deciding what scientific data and information to collect and how to best manage it is a central factor in water quality policies, influencing EPA's ability to perform specific statutory responsibilities.

In preparation for this hearing, you specifically asked us to identify (1) EPA's efforts to address water quality data shortcomings that are impeding performance-based assessments; (2) EPA's plans to improve water information systems; (3) factors affecting the use of remote sensing and satellite imagery for water quality-related purposes; and (4) progress made by the Intergovernmental Task Force on Monitoring Water Quality (ITFM) in addressing governmentwide data management issues. Over the last two months, we have discussed these matters with officials at EPA, the United States Geological Survey, the Office of Technology Assessment, and members of the ITFM.

Summary

Inconsistencies in how data are collected and managed by over 165 federal and numerous state water programs, along with problems involving incomplete or inadequate monitoring data, are recognized as key contributing factors that limit comprehensive assessments of water quality and safety. Initiatives are underway at EPA and on a governmentwide basis to address these data problems. First, EPA's Office of Water is reassessing strategic goals for its water programs and considering steps necessary to implement more comprehensive, performance-based measures of water quality improvements. Second, the Office of Water is proceeding with improvements to some of its important databases to facilitate access and use of data from several sources. Third, remote sensing and satellite imagery technologies could complement other analyses of physical environmental conditions, such as land use patterns, that impact water quality. Finally, EPA is chairing an intergovernmental task force that is preparing a governmentwide strategy to (1) coordinate water quality monitoring and assessment standards and procedures, and (2) improve data collection and dissemination. These efforts hold promise for improving decisions about the effectiveness of water quality programs. However, they are in early stages and face enormous challenges because of the resources and cooperation needed across federal and state governments.

Water Quality Data Are Abundant but Difficult to Use and Narrowly Focused

To begin, I think it is useful to frame the challenges that confront the federal government as it seeks to improve its management of water quality data. Although EPA has prime responsibility for the bulk of federal laws that pertain to water quality, nine other federal departments or independent agencies collect or manage water data. In addition, over 165 different federal programs—supported by at least 75 different federal data holdings—and numerous state water programs exist for water quality matters. Despite this proliferation of data, opportunities for greater data exchange and aggregation are often lost because data are incomplete, incompatible, or of questionable quality. Our recently released report on the Geological Survey's National Water Quality Assessment Program illustrates the formidable barriers—the absence of common data standards and definitions, uncertainties about quality assurance controls, and differences in sampling and analysis techniques—that government agencies face as they strive for greater efficiencies in using and sharing data across organizational lines.¹

Moreover, much of the data collected for water programs today are used to monitor facilities for point source pollution compliance and enforcement purposes under the Clean Water Act, such as specific chemical discharges from industrial and

¹ *National Water-Quality Assessment: Geological Survey Faces Formidable Data Management Challenges* (GAO/IMTEC-93-30, June 30, 1993).

sewage treatment plants. However, according to EPA, many of the nation's water quality problems are attributable to pollution from millions of diffuse or nonpoint sources. For example, rainfall (or snowmelt) moving over or through the ground picks up natural and manmade pollutants, including fertilizers, toxic chemicals from urban runoff (oil, grease) and abandoned mines (acid), and sediment from poorly managed construction sites, crops, and forest lands. Vital monitoring data, nonetheless, are often missing on both the scope and the impact of nonpoint source pollution and on the effectiveness of potential solutions. As noted in our past work, without this data, public officials have had difficulty reallocating resources to deal with the most serious nonpoint source problems.²

EPA and Congress, as evidenced by provisions in pending legislation amending the Clean Water Act, are outlining actions that would move the agency towards a watershed management and pollution prevention approach to improve water quality.³ As you know, this proposed shift would focus resources on identifying the primary threats to human and ecosystem health within a watershed as a whole, in addition to pollution treatment and disposal through point source monitoring and discharge permitting controls. EPA believes that examining both the point and nonpoint sources within a watershed collectively will allow comprehensive assessments of a full range of water quality factors—chemical, physical, biological—needed to target risks and priorities more effectively. However, collecting, analyzing, and reporting on water quality problems in such a comprehensive, integrated fashion is a daunting task, given the many federal, state, and local agencies that share responsibility for amassing nonpoint pollution information.

Let me amplify on these issues by first turning to water quality data problems related to EPA's current responsibilities under the Clean Water Act, as well as the agency's plans for improvements that are applicable to the Subcommittee's interest in performance-based assessments of water quality improvements.

Potential Solutions for EPA's Water Data Problems Are Being Examined

Previously, we have reported on problems with EPA's discharge permit and nonpoint source pollution data and EPA has also acknowledged many problems with its 305(b) information—status reports submitted by the states on their water quality monitoring programs.⁴ Besides the use of different monitoring approaches and assessment methodologies, longstanding data problems include inconsistent definitions, unknown or nonexistent quality assurance controls, and incomplete information about data collection procedures and sampling sites. As a result, it is difficult for EPA to combine data to provide a consolidated picture of national water quality improvements, both spatially and temporally.

EPA has several activities underway to address these problems. The Office of Water's 305(b) Consistency Workgroup has constructed new guidelines to expand states' knowledge and use of data to make evaluations of biological conditions of waterbodies and to improve the consistency among state reported information. EPA expects these guidelines and clarifications to be incorporated into the 1994 state reporting cycle, with additional changes likely to follow in 1996. EPA program officials also indicated that they are making progress in developing guidance for criteria to be used in monitoring, evaluating, and reporting nonpoint source pollution for rivers.

Further changes in identifying and collecting data are being considered as part of a strategic planning exercise within the Office of Water to reexamine and redefine goals expected to be supported by performance-based assessments of water quality changes. Working with other EPA and federal offices and state water agencies, the Office is considering four broad goals covering all of EPA's major water quality responsibilities: (1) protect and enhance public health; (2) conserve and enhance eco-

² *Water Pollution: EPA Budget Needs to Place Greater Emphasis on Controlling Nonpoint Source Pollution* (GAO/T-RCED-92-46, Apr. 7, 1992).

³ A watershed is a hydrologically defined drainage basin that includes not only the water resource—stream, river, lake, estuary, or aquifer—but also all the land from which water drains into that resource.

systems; (3) improve ambient water systems⁵; and (4) reduce pollutant loads (toxic and conventional). The Office of Water is working to establish measurable, performance based subgoals based on quantifiable administrative and environmental indicators.

These efforts are constructive steps and complement congressional and executive branch interest in establishing performance goals, indicators, and measurements for federal programs. However, reaching consensus among EPA, other federal agencies, and the states on (1) targets for outcome performance that can be measured, and (2) performance indicators to measure progress is a formidable task that will require significant coordination and leadership from EPA. Office of Water officials have stated that severe limitations on staff and resources have restricted EPA's efforts to develop better techniques for monitoring nonpoint source pollution, help states develop water quality standards, and perform other critical functions identified as part of its Clean Water Act responsibilities. Still, EPA's water quality budget priorities have been consistently and heavily oriented towards point source problems and the Office of Water has not identified the program costs associated with its more comprehensive water quality approach.

EPA Plans to Improve Information Systems

As you know, the Office of Water maintains some of the largest and most important national water-related databases, containing millions of monitoring and compliance observations used by EPA, other federal and state agencies, researchers, public interest groups, and private citizens. Improvements are being planned for four key databases: (1) Storage and Retrieval of U.S. Waterways Parametric Data (STORET)—EPA's largest single repository for water quality sampling and monitoring data; (2) Ocean Data Evaluation System (ODES)—a system containing monitoring data on facilities discharging into marine waters; (3) Biological Information System (BIOS)—a subsystem of STORET containing data on aquatic organisms; and (4) Permit Compliance System (PCS)—the primary system used to track discharge compliance of regulated facilities.

In an effort to improve users' access and data-sharing with other EPA systems, the Office of Water is redesigning the STORET, BIOS, and ODES databases. Enhancements are also planned for PCS on an annual basis to address users' concerns, such as improved database query capabilities. The approach for improving STORET, BIOS, and ODES is not targeted at meeting broader management goals being developed by the Office of Water; instead, heavy emphasis is being placed on better supporting users' existing practices. As a result, the Office of Water may have an improved method for storing data, better user access, and larger capacity for storing water quality data, but the systems will not necessarily respond to the broader management goals currently under development. At the conclusion of our work, EPA officials stated they would begin addressing the broader goals in their redesign efforts.

Resources Not Yet Estimated for Use of Remote Sensing Technologies

EPA's watershed and pollution prevention approach needs comprehensive data consolidated from many sources to pinpoint water quality changes and their probable causes. Accordingly, you asked us to determine how EPA was using remote sensing technologies for water quality purposes, particularly satellite imagery and aerial photography, and factors affecting their greater usage. In pursuing this matter, we held discussions with officials from the U.S. Geological Survey because of their responsibilities and established, well-recognized expertise in water quality assessments and land mapping. We also talked with an official from the Office of Technology Assessment who is leading a series of comprehensive assessments of the civilian use of satellites across the federal government.

According to EPA officials, the agency uses data from remote sensing technologies for several important applications related to its water quality mission. These include (1) mapping and analysis of land uses that impact water quality, such as agriculture, forestry, and mining; (2) assessments of the physical habitat of aquatic species; and (3) detection of pollutant and thermal releases to waterbodies to assist in water pollution enforcement activities. In addition, U.S. Geological Survey officials said they used remote sensing data for planning of water quality surveys. EPA officials noted that several important benefits accrue from the use of remote sensing

⁵ Ambient water quality refers to the general prevailing physical, chemical, and biological characteristics of water in a given waterbody. Ambient water quality conditions may or may not include effluents—treated or untreated waste material discharged into the environment from sources such as wastewater treatment plants, industrial complexes, or landfills.

technologies, including more complete and timely understanding of land-use changes and their impacts on watersheds, reduced litigation costs because of photographic evidence of noncompliance, and safer inspection of toxic accidents and spills. However, remote sensing cannot be used as a substitute for the direct, labor-intensive collection and analysis of water samples. For example, remote sensing technologies cannot measure the quantity or concentration of chemical pollutants in water bodies. Also, coverage provided by the principal U.S. land resource satellite with the best resolution capabilities (LANDSAT) is so infrequent—once every 16 days—that many short-lived pollution run-off events that follow rainstorms are missed.

Despite these drawbacks, aerial photography and satellite imagery could complement other data gathering techniques and provide important information on land use changes and landscape characteristics affecting watersheds. However, the Office of Water has not yet developed specific plans or estimated resources for using these technologies to support its watershed approach.

Interagency Task Force Is Examining Governmentwide Water Quality Data Improvements

Because water quality data problems transcend agency jurisdictions and responsibilities, the Intergovernmental Task Force on Monitoring Water Quality (ITFM) has been established to develop an integrated, voluntary, nationwide strategy for ambient water quality monitoring. This strategy is expected to provide an organized process for water-quality monitoring that can meet the objectives of various monitoring activities, better integrate existing monitoring efforts, make more efficient use of available resources, distribute information more effectively, and provide comparable data and consistent reporting of water quality status and trends. Membership includes more than 90 representatives from 10 federal agencies, 8 state agencies, one interstate organization, and one Indian nation, with a representative from EPA's Office of Water serving as the Chairperson. The ITFM expects to submit a final report to the Office of Management and Budget in December 1994 outlining recommendations for strengthening coordination of a wide range of water quality activities, including improvements in monitoring data used for decision-making and program evaluations.

Several working groups from the task force are focusing on data collection and management problems and expect to make recommendations on data standards, common definitions, and metadata requirements.⁶ Decision papers on many of these topics are expected to be circulated for review by September 1993. These activities, while still in working stages, show promise for identifying and planning measures to address governmentwide improvements to water quality monitoring, data collection, and information sharing. However, the federal and state resources necessary to implement the suggested changes remain undefined, and developing and implementing a nationwide strategy is an enormous task and will require commitment and cooperation from all levels of government.

Concluding Remarks

In summary, EPA is confronted with formidable challenges in defining and achieving clean water goals that emphasize watershed management and pollution prevention approaches. Without adequate resources and funding, these approaches stand little chance of making progress in improving the nation's water quality. Successfully supporting these new approaches requires (1) strategically reexamining the capabilities needed from its information technology investments to support this new direction, (2) defining the requisite resources; and (3) securing interagency and intergovernmental cooperation.

That concludes my statement, Mr. Chairman. I would be happy to answer any questions that you or other members of the Subcommittee may have about our work.

⁶ Metadata describe such things as how the data were collected, what limitations exist, and how the data are stored and can be retrieved.

TESTIMONY OF HEDIA ADELSMAN, WATER RESOURCES PROGRAM
MANAGER, WASHINGTON DEPARTMENT OF ECOLOGY

INTRODUCTION

Good morning. I am Hedia Adelsman, Water Resources Program Manager of the Washington Department of Ecology. I am also a member of the Western States Water Council (WSWC). I have been asked to testify today on behalf of Governor Mike Lowry, who is a member of the Western Governors' Association (WGA). WGA and WSWC work together to provide leadership in developing regional solutions for water issues in 18 western states, and I have been involved in most of their water-related activities. I am pleased to represent Washington, WGA, and WSWC in testifying on Section 602 of S. 1114—STATE CERTIFICATION. Copies of WGA and WSWC positions are attached.

Like several other states, Washington has significant hydropower development. We also have an extensive and sophisticated water resource management program which is used to govern all water uses and related matters. We believe that it is critical for the states to exercise appropriate jurisdiction with respect to all beneficial uses of water, including hydropower generation. While Section 401 applies to all activities requiring a federal license or permit, its application regarding hydropower projects has engendered the context for this proposed clarifying provision of S. 1114. For this reason, before I discuss the specific language of S. 1114, I will explain in some detail the licensing activities of the Federal Energy Regulatory Commission (FERC), as they have called into question the states' legitimate role in water resource management.

BACKGROUND—STATE/FEDERAL JURISDICTION AND HYDROPOWER LICENSING

No one seriously questions the need for the exercise of federal jurisdiction in the licensing of major hydropower projects. The Federal Power Act (FPA) establishes a strong federal role, but appears to define a significant state role as well. The act contains "savings" language that shows deference to state water law in harmony with Congress' longstanding efforts to assure that states control the appropriation, use and distribution of water. In the 1940s, when faced with a situation where the exercise of state law threatened the veto of a large hydropower project, the United States Supreme Court held, in a case referred to as *First Iowa*, that FERC's authority to license federal hydropower projects preempts conflicting state control under the FPA. Previous to this case, the Federal Power Commission had carried out its programs based on dual federal/state authority, where the Commission licensed electric generating facilities while the states issued related water rights. Understandably, following the decision, the Commission paid less attention to state authority to regulate water resources. However, the dearth of hydropower projects allowed hydro development to proceed with a relative lack of problems. States turned to informal methods of conflict resolution in most instances, and hydropower development under federal law and state water resource management coexisted, albeit somewhat uneasily.

In the late 1970s and early 1980s, federal energy statutes prompted a significant increase in hydropower permit applications, which magnified controversies caused by FERC's unwillingness to defer to water use decisions made by state agencies. These state agencies not only manage and allocate water rights, but also conduct water planning, protect the public interest in water use, certify compliance with state and federal water quality laws, verify the structural safety of dams, and carry out other related functions. Eventually, controversy between FERC and the states over some of these functions led the Supreme Court to review a case that offered an opportunity to revisit the *First Iowa* holding.

In the *Rock Creek* case, California imposed requirements on a hydropower project to protect a downstream fishery. These bypass flows were more stringent than FERC's proposed requirements. The Supreme Court found that the case presented a close question, but upheld its earlier *First Iowa* interpretation. The Court concluded that it was better to have the matter of federal/state jurisdiction under the FPA settled than to have it settled right. The decision disrupted California's comprehensive water management system and displaced its authority to balance competing water uses.

FERC's position of exclusive jurisdiction has caused other significant problems. These difficulties have dealt with the imposition of instream flows by FERC and FERC's refusal to recognize such flows when established by states, the subordination of water rights for hydro development to other water uses, FERC's failure to

recognize state water planning decisions, and FERC's efforts to subvert the state water quality certification process, among other things.

One such example of a specific licensing decision by FERC that demonstrates the need for joint FERC/state jurisdiction over hydrolicensing occurred in the state of Idaho in June 1992. Idaho had determined that protection of the stream environment in the Falls River in the eastern part of the state was necessary to preserve outstanding fish and wildlife, recreation, geologic and aesthetic values. The state contended that FERC should not license a hydroproject on a protected stream. After FERC licensed the Marysville project on the river a penstock failure caused tens of thousands of tons of sediment to wash into what Idaho Governor Cecil Andrus called "one of the premier fishing streams of the nation." Governor Andrus said, "It is my belief that the cause of the failure was due, in large part, to FERC's remoteness and lack of oversight and supervision of construction activities of the licensee. . . ." He concluded, "FERC's actions in this matter have done little to impress me that it is qualified to assure protection of public values. To the contrary, not only was the setting of bypass flow conditions and failure to give due recognition to existing water rights and state water quality standards a comedy of errors, but now we have an ecological disaster on our hands." This disaster is in the process of being cleaned up.

OVERVIEW OF CLEAN WATER ACT SECTION 401.

Another area of dispute has been the certification of hydropower projects under Clean Water Act (CWA) Section 401. The states have viewed the certification procedure as an appropriate recognition of state jurisdiction over water resources, a view which they are convinced is consistent with congressional intent. FERC, and most of the hydropower industry, have taken a much narrower view of the state role. I am here today to describe why a simple clarifying amendment like Section 602 of S. 1114 is warranted.

CWA Section 401 authorizes states to deny certification of a federally permitted or licensed activity if the activity would result in violation of state water quality programs. In the alternative, a state is allowed to certify that an activity, such as a hydropower project, may be carried out in harmony with state programs, provided certain conditions are met. The breadth of state certification is based on "the applicable provisions of [CWA] Sections 301, 302, 303, 306, and 307 . . ." The heart of the certification is determined by Section 303, which deals with state water quality standards.

Application of the state certification process has proven difficult over time. While there is some agreement that the states should have an important role under Section 401, FERC and its hydro-applicants contend that a state must act based on narrow, chemical water-quality parameters. They also contend that state determinations should be made quickly, on a "thumbs-up or thumbs-down" basis.

Challenges to the scope of state review have led to court battles. While some decisions have held against an expansive state role under CWA Section 401, others have held in favor of the states. For example, a recent decision from the state of Washington Supreme Court, as I will explain, correctly held that the breadth of state certification under Section 401 should not be limited only to chemical parameters. Rather, the court found that the Washington Department of Ecology could condition its certification of a hydropower project on maintenance of an instream flow in a portion of the river that would be affected by the project. This instream flow requirement was found to be a proper condition in the water quality certification. In other words, a water quantity-based condition was allowed as part of the Section 401 water quality certification.

S. 1114 Section 602 would clarify that the result in the Washington case is appropriate in other states, by allowing states to certify whether an activity complies with state water quality standards and provides for the protection, attainment, and maintenance of designated uses included in the standards. Such certification generally requires a more complex approach than a simple determination of whether the chemical parameters of a state's water quality standards would be violated. States maintain that they already have the authority to make this type of certification under Section 401 as it is currently written. Nevertheless, in light of conflicting court decisions, the amendment contained in S. 1114 Section 602 would settle this area of conflict by clarifying congressional intent that states should act in partnership with FERC to protect the quality of the nation's water and related values and uses. Given the states' history in dealing with FERC on hydropower licensing, this clarification should be made by Congress.

WASHINGTON EXPERIENCE

Specifically, the Washington Supreme Court held that the FPA does not preempt the Washington Department of Ecology from including minimum streamflow conditions in a CWA Section 401 certificate issued in conjunction with a hydropower project licensed by FERC. In that case, the City of Tacoma and the Jefferson County Public Utility District No. 1 planned to build a hydroelectric facility on the Dosewallips River. The applicants were required to obtain a Section 401 certification, which was granted but conditioned upon maintenance of a minimum streamflow in an affected portion of the river. The applicants argued that federal law preempted the state from establishing the streamflow requirement, and that in any event my department was outside its authority because its suggested streamflow was calculated to enhance, rather than preserve, the fishery.

The court found that the CWA authorized Washington to include baseflow requirements in the Section 401 certificate to ensure compliance with state water quality standards. The applicant argued that the standards, and therefore the scope of the Section 401 certification, should be limited to control of pollution discharge, and could not include streamflow levels. We maintained that the Section 401 certification was an appropriate method of carrying out a provision of state law which provides that "perennial rivers and streams...shall be retained with baseflow necessary to provide for preservation of wildlife, fish, scenic, aesthetic, and other environmental values. . . ." The court agreed that the streamflow conditions were necessary to assure compliance with state law, as envisioned under CWA. The court said, "The Section 401 . . . certificate may include conditions to enforce all state water quality-related statutes and rules. . . . Inasmuch as issues regarding water quality are not separable from issues regarding water quantity and base flows, we . . . hold that [Washington law on base flows] qualifies as an 'appropriate requirement of state law for purposes of [CWA] Section 401.'"

The court considered the contention that the FPA preempted the state's action. The FERC applicants relied on the U.S. Supreme Court's line of decisions beginning with *First Iowa* and ending with *Rock Creek*. The Washington Supreme Court distinguished these cases, noting that they dealt with the scope of powers saved for states under FPA Section 27, whereas in issuing a CWA Section 401 certificate Ecology derived its authority to act directly from provisions of federal law. The court noted that CWA Section 401 "completely alters the legal context and renders untenable [the applicant's] preemption argument." The court continued, "When the FPA and the [CWA] are considered together, the comprehensive scheme that emerges is one in which Congress left room for the state to supplement the FPA through the [CWA] Section 401 certification process." "Simply put," the court said, "Federal preemption . . . does not apply . . . where a state is acting to fulfill its federally mandated role." This ruling is consistent with the Department of Ecology's application of the law, an application which has proved successful. Several streams in the state, some which had been dewatered for up to 50 years and from which salmon populations had disappeared, now have water in them because of state imposed bypass flow requirements. This enhanced fish habitat, especially the creation of spawning areas, has allowed anadromous fish populations to return. The presence of salmon in previously dry streams is consistent with current major efforts in the Northwest to restore aquatic habitat and prevent further listings of endangered species.

COMMENTS ON OPPOSITION TO S. 1114 SECTION 602

Opponents to Section 602 of S. 1114 may argue that it is unsound because federal preemption is necessary in hydropower licensing so that FERC can balance, as a single agency, the many conflicting public uses involved with hydropower production. When examined in the context of western water law and management, however, this argument, rather than calling for fair treatment, calls for special treatment for energy production uses only. States have carried out the primary role in water resource management in the West since the region was settled. Congress has repeatedly deferred to state authority in this regard. As federal interests have increased, it is quite common for state water rights applicants to also be required to obtain various federal permits to exercise their water rights. This system of dual jurisdiction enables both federal and state governments to protect their legitimate interests. It represents a system that functioned well with hydropower licensing before the *First Iowa* decision was handed down. Even today, in most instances, hydropower applicants come forward to obtain state water right permits because they understand the protection that those permits provide under state law. Opponents of dual jurisdiction seem unable to present evidence that such a system is unworkable, or inimical to the public interests.

To argue that states should now have a very limited role, under Section 401 of the CWA, is to say the state has virtually no legitimate interest in this area. Far from being the case, this argument simply overlooks the ability of state water management efforts to balance the conflicting goals of protecting both private rights and the public interest for the greater good. Given the closeness of state regulators to the issues and watercourses involved, and the fact that water uses are interdependent because each use affects the quality and quantity of water available for other uses, states are ideally situated to exercise significant and broad authority to assure that hydropower projects comply with state water quality programs.

Opponents may also argue that Section 602 of S. 1114 is unnecessary because state interests are protected under FPA Section 10(a), which gives FERC the responsibility to balance many public uses by ensuring that licenses are best adapted to a comprehensive plan for the affected waterway. Also, they may assert that, under the Electric Consumers' Protection Act (ECPA), FERC must determine whether a project is consistent with state comprehensive water planning. The difficulty with these assertions is that FERC does no comprehensive planning and is not equipped to adequately consider or protect all competing water uses and interests. FERC has failed to give the type of deference to state water planning that was envisioned when ECPA was passed. It considers state comprehensive water plans in licensing, but does so only on an equal basis with many other documents submitted for the record in hydropower licensing cases. Thus, neither FERC's "comprehensive planning" responsibility nor the ECPA amendments are adequate substitutes for compliance with state water allocation or quality certification procedures.

In reality, FERC does not have at its disposal, nor can it develop and review, the extensive state water rights records, hydrologic and water quality-related data, and other information necessary to make informed decisions regarding water quality and water needs and uses in a state. Such information can only be available to FERC if every affected water right holder files a protest in a FERC proceeding. The FERC licensing process is clearly not structured to accommodate the thousands of parties that would have to participate in such a proceeding.

As to the argument that FERC is a necessary arbiter in dealing with possible interstate conflicts, such conflicts are relatively rare. The great majority of hydrolicensing decisions affect local interests and cause or have the potential to cause conflicts that can be resolved through compliance with state water management procedures. Where interstate problems arise with respect to large projects, they can be settled through proceedings similar to equitable apportionment or interstate compacts, which are understood well by western water officials, but not by FERC.

CONCLUSION

Policy statements of WGA and WSWC recommend that legislation reauthorizing the CWA include an amendment to Section 401 to ensure that any federally licensed activity resulting in an alteration or hydrological modification of surface waters be preceded by Section 401 certification that assures compliance with all provisions of state law. Section 602 of S. 1114, as a clarifying amendment to current Section 401 language, would essentially accomplish this result, and therefore is supported by WGA, WSWC, and the state of Washington. Under it states would retain primary jurisdiction over water quantity issues and, under the CWA, jurisdiction over the integration of water quantity and quality considerations through the Section 401 certification process. The CWA and FPA should work together to encourage cooperation, rather than confrontation, in the process. A balanced and cooperative approach is needed.

The western states recognize the linkage between water quantity and water quality and the fundamental role these considerations play in effective and comprehensive water management. As Senators Baucus and Chafee have rightly recognized in the provisions of this bill which address state-based watershed planning, a more holistic means of managing our nation's water resources is necessary. States, by virtue of their primacy over water resources and their extensive experience with, data on, and understanding of the existing rights and public values associated with their water resources, have rightly taken the lead in this area. The clarification of Section 401 included in S. 1114 is fundamental to the success of any comprehensive water management effort, including the state-based watershed planning program included in this bill. Without the assurance provided by Section 401 that states will have a role in assuring federal compliance with all provisions of state law, there is no means of ensuring that watershed planning efforts, as well as other state water quality and quantity management activities, are recognized and not disrupted arbitrarily. We support this amendment and urge that it be enacted as part of the CWA reauthorizing legislation.

Western Governors' Association

Resolution 93-009

SPONSOR: Governor Andrus

SUBJECT: Reauthorization of the Clean Water Act—Section 401

A. BACKGROUND

1. Clean water is essential to the health and quality of life of the citizens in the arid western United States. Since water is a scarce and precious resource in the West, any alteration, modification or degradation of water quality must be managed with a full understanding of local social, environmental and economic interests.
2. Over the past twenty years it has become evident that water quantity issues—specifically water resource allocation and the determination of beneficial uses are intricately related to the maintenance of water quality, specifically the protection of beneficial uses.
3. Western states have developed a high level of expertise in integrating water quality criteria with their longstanding authority in allocating water resource through legislative action, planning strategies, and regulations to ensure protection of water quality while promoting water conservation and reuse.
4. Hydrological modification and alteration of western waters by federally licensed hydroelectric projects often result in water quality degradation, since under the Federal Power Act decisions integrating water quantity and water quality are often made by bureaucrats in Washington, D.C. that are unfamiliar with, and insensitive to local environmental and economic interests.
5. Reauthorization of the Clean Water Act is now being considered in Congress. The experience of western states in managing programs under the Clean Water Act is that the Act needs to be expanded to ensure that the states and not the federal government make crucial decisions on integrating water quantity and water quality in the context of federal licensing actions.
6. Presently under Section 401 of the Clean Water Act, the states have explicit authority to issue or deny water quality certification for federally licensed activities that result in discharge of pollutants to state waters. In order to ensure that the integration of water quantity and water quality issues occur at the state level, it is necessary to expand Section 401 of the Act to include water quality certification for hydrological modification and alteration of state waters.

B. GOVERNORS' POLICY STATEMENT

1. The states should retain primary jurisdiction over both water quantity and water quality issues through the water quality certification process set forth under Section 401 of the Clean Water Act. The Clean Water Act reauthorization should include an amendment to Section 401 that would ensure that any federally licensed activity that results in an alteration or hydrological modification of surface waters must be preceded by a Section 401 certification that ensures state authority to determine the integration of water quantity and water quality issues.

C. GOVERNORS' MANAGEMENT DIRECTIVE

1. WGA staff is directed to transmit this resolution to the appropriate committees of Congress, the President, the Administrator of the Environmental Protection Agency, and the western congressional delegation.
2. WGA is to monitor this legislation and implementing regulations and to work with the appropriate public policy organizations in support of the governors' policies.

POSITION OF THE WESTERN STATES WATER COUNCIL

BACKGROUND

Clean water is essential to the quality of life and health of the citizens of the nation. This is particularly true in the arid West, where water is a scarce and precious resource that must be managed considering all social, environmental, and economic values and needs. Because of their unique understanding of these needs, states are best able to manage the water within their borders. Much progress has occurred under the Clean Water Act (CWA) toward the goal of controlling water pollution. Western states have made great strides in integrating water quality and water quantity decision-making and have developed legislative and planning strate-

gies for promoting these goals as well as promoting water conservation and water reuse.

The CWA is now being considered in Congress for reauthorization. The outcome of the debate will affect the ability of state, federal, local, and tribal governments to protect water quality, and could affect the ability of state governments to administer water rights. The Western States Water Council encourages the reauthorization of the CWA based upon the following principles. As issues become more clearly defined, the council will provide further comments in future position statements.

CROSSCUTTING ISSUES

There are two issues of importance, pollution prevention and watershed management, which deserve special consideration during the CWA reauthorization process, because they potentially impact all programs authorized by the CWA.

POLLUTION PREVENTION

Pollution prevention has recently received a great deal of attention, but needs to be given more emphasis. The concept of pollution prevention cuts across all CWA programs by offering a means of avoiding complex and costly "command and control" approaches to water pollution control and clean up. Expanded funding should be provided to states for development of pollution prevention programs, and incentives such as greater flexibility in using existing grants should be provided to states with strong pollution prevention programs.

WATERSHED MANAGEMENT

The watershed approach offers great opportunities. It allows focus on the most critical problems that affect the watershed while eliminating duplication and inconsistency between regulatory entities. It allows public involvement to be focused on a defined area where results can be measured. It has the potential to foster cooperative problem solving where the important players can help each other solve mutual problems in a way that can result in an improved environment at less cost. It provides a feasible means of developing an "ecosystem approach" relative to the protection of water quality and related values. To encourage these benefits the CWA should embody the following principles:

1. States should be encouraged, but not mandated, to utilize a watershed approach for water quality and resources management.
2. Any absolute mandate contained in the CWA should be limited to water quality concerns.
3. While states should be allowed to craft their watershed management to meet their needs, the goals and the scope of such programs must be clearly defined. This definition is essential since "watershed management" has many different meanings to different people. In general, basin-specific goals and programs should be selected and prioritized on the basis of risk to quality-of-life, human health, and ecological concerns.
4. Watershed management should emphasize performance, not planning. A uniform set of best management practices should not be mandated. States should be allowed to identify appropriate individual strategies to be applied within, and for, a given basin.
5. There should be no interference with the rights of the states to manage allocation of their water supplies.
6. The internal structure of state government should not be mandated. States should be allowed to use existing authorities and programs or set up advisory committees and watershed councils to meet their needs as they understand them.
7. Flexibility should be provided in both the procedural and substantive requirements of clean water programs to meet the goals of improving water quality and the environment as soon as possible.
8. EPA should provide technical, financial, and research assistance. It should not mandate any particular approach or try to mandate its preferred methods.
9. Federal funding should be made available to the states to support watershed management. The funding should not be tied to following processes specified by EPA. There should be sufficient flexibility in funding to allow states to deal with watershed problems according to the priorities they have identified.

FUNDING

1. The minimum funding at the national level for the state revolving fund (SRF) should be \$2.4 billion annually for at least five additional years beyond the current authorization to meet the original funding commitment of the CWA. Funding levels must be restored in response to changes from the "stimulus package" which caused

a reduction of funding to unacceptable levels. This funding is also needed to provide adequate assistance for new needs created by the 1987 reauthorization, such as controls on non-point source pollution, stormwater, and toxics. Adequate funding should also be provided to meet the water quality needs of small communities and rural areas. A grant program or combination loan/grant program with loan terms greater than 20 years should be implemented through new funding and/or in a manner that does not deplete SRF assets.

2. CWA Section 106 funding should be increased to a level that enables states to maintain effective water quality planning, ambient monitoring, permitting, and compliance. Funds available to states under CWA Sections 104, 319, and any new funding for pollution prevention and watershed management should be combined into Section 106, and a single grant should be awarded to each state. States should then have flexibility in targeting the expenditure of funds.

3. For any new federally mandated programs, new federal funds should be provided. The Council opposes any increased matching requirements for federal funds.

4. In providing SRF financial assistance to municipalities, federal requirements other than those specified by CWA Title VI should not be imposed. Once federal capitalization of the program ceases, EPA oversight should be limited to ensuring that the SRF is maintained. Federal crosscutting laws associated with the SRF program should be eliminated. Costs associated with the purchase of land, easements, and rights of way should be eligible for SRF funding.

5. The 4% limitation on SRF administrative costs should be based upon the authorized level rather than the appropriated capitalization grant amount, and provisions should be made for a minimum amount of federal assistance per state for administrative costs.

6. Separate funding and administrative requirements should be provided for any drinking water state revolving fund program. Money allocated for the drinking water fund should be from a source separate from the wastewater SRF.

7. Alternatives to typical "command and control" programs can be promoted through creative funding incentives. The elimination of "cross-cutter" requirements for states with 90% of point sources meeting secondary treatment or for states with no or minimal National Pollution Discharge Elimination System (NPDES) permit backlogs are two examples.

NON-POINT SOURCE POLLUTION CONTROL

1. Maximum flexibility should be provided to states to effectively implement non-point source (NPS) pollution control programs. NPS funding should enable states to balance program elements and focus, as needed, on technology development and transfer, monitoring, assessment, demonstrations, local community technical assistance, and institutionalizing non-traditional water quality management programs.

2. NPS plans, demonstration projects, and program development as envisioned in the 1987 CWA amendments are not yet complete. To produce needed results, states must have the ability to use a significant portion of their CWA Section 319 funds to establish and maintain long term, consistent programs as envisioned by the 1987 amendments.

3. A provision should be added to the CWA to ensure that Section 319(k), requiring federal agency activities to comply with state NPS management plans, is implemented.

4. EPA should not define national, mandatory management practices to control agricultural runoff and other forms of NPS pollution. States, however, should be required to control such pollution where it causes violation of water quality standards. Both the management practices and the specific waters affected should be defined by the states. A voluntary approach should be acceptable if the states have authority to enforce mandatory requirements where water quality standards violations occur. The irrigation return flow exemption from the NPDES should not be rescinded.

5. Federal agencies should be required to develop incentives for implementing NPS controls on federal lands and for federally supported activities. For example, support payments could be increased to farmers with effective conservation plans and bonus acreage awarded to lumber companies with successfully implemented NPS plans.

WATER QUALITY STANDARDS

1. The states must have the primary role in establishing and interpreting water quality standards that meet the intent of the CWA. EPA should be required to provide necessary criteria development guidance to states in a clear and timely manner.

2. The CWA should clearly acknowledge that municipal stormwater systems are to implement best management practices to the maximum extent practicable with the goal of meeting water quality standards.

3. The various water quality assessment requirements should be integrated into a single, streamlined assessment under CWA Section 305(b). The assessment requirements should not be overly burdensome and the 305(b) assessment should be prepared every three to five years rather than every two years.

4. The states should continue to review and revise water quality standards on a triennial basis. EPA should continue to be responsible for approving adopted state water quality standards to assure interstate compatibility and compliance. However, the application of water quality standards in support of state water quality protection goals must continue to be the prerogative of the states.

5. States must be allowed to establish water quality standards flexible enough to account for natural variations in water quality and background levels.

6. Not all waters should be classified as fishable, swimmable. For example, the CWA should be amended to recognize the unique nature of constructed drains and canals and allow water quality standards to be set that recognize the benefits provided by these waterways (many of which would not exist without the agricultural activity) and the nature of agricultural operations and their ability to reduce pollutants from non-point sources. In such cases, protection of receiving waters for designated beneficial uses should be assured. Also, there are waters which historically, for natural reasons and causes, cannot meet fishable/swimmable criteria.

EFFLUENT DOMINATED WATERS/WATER REUSE

1. Natural channels are often needed to transport reclaimed water to an area of reuse. Reuse of wastewater is an increasingly important source of water in the West. Effluent dominated waters also support riparian habitat. In the CWA reauthorization, Congress should recognize the interrelationship of such waters and water quality standards, riparian habitat, and water rights issues, and should develop policies that support the objectives of state and federal law, by allowing establishment of appropriate water quality standards, based on intended uses, for natural conveyance systems and man-made waterways that discharge flows to waters of the United States.

2. A policy statement should be added to the CWA such as: It is the policy of Congress to allow states to encourage the reuse of treated wastewater, as a component of water quality control as well as comprehensive water management.

3. The CWA reauthorization should allow the permitting authority maximum flexibility in establishing requirements pertaining to effluent dominated waters and ephemeral and intermittent streams based upon net environmental benefit under applicable law. States should be encouraged to adopt water quality standards for reclamation projects to control toxicity, nutrients, and other water quality parameters to provide for reasonable protection of designated water uses. EPA should assist with research to establish safe effluent discharge parameter levels for human contact water uses.

FEDERAL/WESTERN STATE ISSUES

1. Water pollution control programs are administered most efficiently and effectively at the state level. Delegated state programs should be approved if they meet the goals, objectives, and intent of federal statutes. They should not be less stringent than, but need not be identical to, EPA regulations, policies, or procedures.

2. CWA Sections 510(2) and 101(g) are clear expressions of Congressional intent regarding deference to the states' role to allocate quantities of water. This fundamental principle of deference, which is manifest in many other federal environmental statutes, must not be weakened in the context of the CWA reauthorization.

3. Virtually all western states have in place mechanisms to establish and maintain instream flows. Statutory requirements in the CWA for maintenance of such flows would affect water rights and impact water management in the West. No such requirements, either explicit or implicit, should be included in the CWA.

4. Additional federal research and technical assistance are needed on the following topics important to western states: turbidity, suspended solids, physical integrity of the water body, biotic methods applicable to ephemeral and intermittent waters, definition and regulation of ephemeral and intermittent waters, federal land and facility compliance with state water quality standards, mining activities as they relate to storm water, and turbidity.

5. To maintain an appropriate federal/state partnership, it is essential that state officials have a meaningful voice in EPA policy development, particularly in the early stages of such development before irreversible momentum leads toward pre-

scriptive programs. State participation in EPA policy making should not be subject to the Federal Advisory Committee Act or the Administrative Procedures Act.

WETLANDS

1. The existing CWA Section 404 regulatory program must be improved. Sole authority for administration of the program should be vested in one agency. The program should encourage and enable states to assume full or partial permitting authority. Financial support should be provided to states that assume the federal program. The program should include research into and development of techniques to assess wetlands functions and values.

2. The continuing loss and degradation of the nation's wetlands base is unacceptable. A no-net-loss policy is an important step toward reversing that trend. Such a policy, however, must provide flexibility and be implemented at different rates and in different ways in various regions of the country to reflect regional wetlands needs, conditions, and types.

3. National wetlands policy should lend itself to implementation through state, regional, and local plans and programs, and recognize individual state and local planning and regulatory efforts to preserve and protect wetlands.

4. The diverse needs and types of wetlands nationwide, and concern for human and economic impacts, will make it difficult to achieve a no-net-loss goal. To achieve such a goal, a broad range of non-regulatory programs (such as subsidies and tax incentives, public acquisition, conservation easements and leases, and other non-punitive approaches) and regulatory programs will be required.

GROUND WATER

1. A national regulatory program for ground water would be inappropriate and should not be part of the CWA reauthorization. Ground water protection and management are primarily the responsibilities of state and local governments. Such governments must have the flexibility to develop and continue existing programs appropriate for their own circumstances, including strategies and mechanisms appropriate to assure ground water quality protection and preserve their ability to allocate, manage, and protect rights to use ground water.

2. The federal role in ground water management should be to provide technical assistance, gather data, and promote research to support state programs. Also, any federal funds that are provided for ground water protection should be made available to support all phases of program development and implementation of state ground water quality programs, not just program development.

3. Federal agencies should be required to conduct their activities in accordance with, and without duplication of, state and local ground water protection programs.

4. EPA's Comprehensive State Groundwater Protection Program strategy is an acceptable approach to ground water protection to the extent that it is carried out on a voluntary basis. This approach provides flexibility to address the most pressing ground water problems within a given ground water basin.

STORMWATER

1. Existing requirements for NPDES permits applicable to stormwater discharges are often unrealistic and may, to a large extent, be unachievable, especially in arid areas. The CWA should clarify previous congressional intent that municipal stormwater dischargers are to implement best management practices and should not necessarily be subject to end-of-pipe treatment standards. Best management practices shall be developed through public participation and be designed to ensure that control of stormwater discharge is consistent with regulatory implementation of mandated stream standards. State regulatory agencies are encouraged to establish additional monitoring and performance criteria to assure meeting goals of watershed management programs.

2. The statutory deadlines for implementation of the stormwater program should be revised to establish realistic deadlines for permit issuance and to accommodate phased implementation of stormwater regulatory programs.

3. Recognition should be made of the tremendous responsibility placed upon states by federal stormwater regulations. Significant additional federal resources should be made available to avoid major cuts in other programs.

4. Stormwater pollution controls may include small ephemeral ponds and injection wells as part of on-site retention requirements which could result in significant pollution of ground water. Impact of these requirements may adversely affect the overall water management process. States need the flexibility to design optimum water quality/water quantity interfaces.

ANTI-BACKSLIDING

1. The CWA should be revised to clarify the application of anti-backsliding. EPA's inaction on guidance or regulations regarding anti-backsliding has been detrimental to the permitting process, resulting in delaying permits or causing less-restrictive permits to be written.

2. The CWA should be amended to allow removal or modification of effluent limits in cases where the limit is determined to be unnecessary because of errors in calculation, publication of new scientifically valid information, or determination that the substance being limited is not present in the discharge.

CLEAN LAKES

1. CWA Section 314 funding should be increased to a level that recognizes the key role the Clean Lakes Program plays in managing the nation's lakes for maximum beneficial use and enjoyment.

2. Appropriations should be sufficient to support meaningful efforts to continue assessment and identification/implementation of methods and procedures to restore lake quality.

COMPLIANCE WITH STATE LAW UNDER CWA SECTION 401

States have primary jurisdiction over water quantity issues and should retain primary jurisdiction under the CWA over integration of water quantity and water quality considerations through the water quality certification process set forth under Section 401. The CWA reauthorization should include an amendment to Section 401 that would ensure that any federally licensed activity that results in an alteration or hydrological modification of surface waters must be preceded by a Section 401 certification that ensures compliance with all provisions of state law.

TRANS-BORDER AREAS

EPA needs the authority, responsibility and resources to deal with water quality issues in trans-border areas. Also, mechanisms should exist for better coordination and participation between EPA, the states, other agencies, and our neighboring nations.

WATER QUALITY CONTROLS ON TRIBAL LANDS

In order to prevent voids in regulation, state water quality standards should be effective on Indian lands until replacement standards have been adopted by tribal governments which have been designated as states, or promulgated by EPA.

TESTIMONY OF ROGER WOODWORTH, PRESIDENT, NATIONAL HYDROPOWER ASSOCIATION, WASHINGTON, DC

My name is Roger Woodworth. I am Strategic Counsel to the President of the Washington Waterpower Company, an investor-owned utility serving 260,000 electric customers with facilities in the states of Washington, Idaho and Montana, and I am pleased to appear before you today in my capacity as President of the National Hydropower Association ("NHA"). NHA is a non-profit organization founded in 1983 to be a national voice for the hydropower community in maintaining the viability of hydropower technology as a low-cost, clean, reliable and safe source of renewable energy. NHA's members represent the broad spectrum of the hydropower industry, including project owners and operators—public utilities, investor-owned utilities, cooperatives, municipalities and independent power producers—as well as equipment manufacturers, engineers, and legal and consulting firms from all regions of the United States. The hydropower industry serves over 40,000,000 customers in 41 states. Most of these customers are residential customers; thus, approximately 100,000,000 Americans benefit directly from hydropower generated electricity. At the outset, I should also note that this testimony has been prepared in consultation with and endorsed by the Northwest Hydroelectric Association.

NHA is pleased to have this opportunity to present our views on the reauthorization of the Clean Water Act ("CWA"), 33 U.S.C. § 1251 *et seq.*, as proposed in S. 1114, the Water Pollution Prevention and Control Act of 1993. NHA commends the subcommittee for holding this hearing today to focus on the critical water quality certification process under Section 401 of the CWA, 33 U.S.C. § 1341.

As advocates of hydroelectric power generation, the members of NHA strongly believe in the protection of clean water and support reauthorization of the CWA. The CWA, as currently implemented in conjunction with the Federal Power Act ("FPA"), 16 U.S.C. § 791 *et seq.*, maintains a sound balance between environmental

concerns and energy policies at both the state and federal levels. NHA submits that any reauthorization of the CWA must continue to protect that existing balance.

DESCRIPTION OF THE HYDROPOWER INDUSTRY

The hydropower industry is committed to the production of energy for the Nation in a manner consistent with the stated goals of the CWA "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." 33 U.S.C. § 1251(a). Construction and operation of hydropower projects can have adverse impacts on the environment, but effects on water quality tend to be minor and readily controlled. Although the water that hydropower projects use to spin turbines to generate electricity is returned to the waterway without added chemicals or other wastes, water quality impacts (water temperature and dissolved oxygen) may result from water storage and the regulated release of flows. Fortunately, techniques are generally available to control these problems and assure the maintenance of water quality consistent with state standards under Section 401 of the CWA. As the United States Environmental Protection Agency ("USEPA") has acknowledged, hydropower projects can, in some instances, enhance water quality through the regulation of reservoirs and downstream water flows. *U.S. Envtl. Protection Agency, Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* (Jan. 1993).

Moreover, hydropower has a wide variety of environmental and other benefits for our Nation. Our projects utilize an endlessly replaceable inflation-free fuel—falling water supplied by rain and snow. Air quality is maintained through this emission-free generating technology. In fact, hydropower resources have the potential to provide a greater portion of the Nation's electric power needs without any additional emissions of carbon. Assuming appropriate measures are available to address other environmental concerns, the development of additional hydropower resources from existing projects and non-power dams could offset carbon emissions by six (6) million metric tons per year by the year 2000.

Hydropower facilities constitute nearly twelve percent (12%) of the Nation's total energy capacity, representing 85% of all renewable energy generation. This critical portion of our energy supply is frequently provided in multi-purpose projects that provide additional benefits by serving a wide array of public needs, including, among others, irrigation, flood control, navigation, municipal and industrial water-supply, fisheries improvement, and recreation. Not surprisingly, this clean and environmentally sound source of generation is preferred by American consumers by a two (2) to one (1) margin.

As an active participant in the use and enjoyment of the Nation's waterways, NHA applauds the general approach adopted in S. 1114 for maintaining the ecological integrity of our Nation's waterways and surrounding watersheds. This comprehensive approach to protecting water quality is in keeping with the lessons learned by the hydropower industry and others in our years of stewardship over these important national resources. NHA is concerned, however, that proposals to license and construct new hydropower projects and proposals to relicense existing hydropower projects will be subject to duplicative and conflicting regulation. The holistic approach of S. 1114 must be expanded to account for the integration of equally vital national interests represented by the comprehensive authority that Congress has granted federal agencies in other federal statutes—most particularly for our industry, the FPA.

SECTION 401 WATER QUALITY CERTIFICATION

Although hydropower introduces no pollutants into our waterways, the operation of our federally licensed projects in waterways has been deemed by the Federal Energy Regulatory Commission ("FERC") and the courts to be subject to federal water pollution control, primarily through the Section 401 water quality certification process. Indeed, the CWA provides that "[n]o license or permit shall be granted until the certification required by (Section 401) has been obtained or has been waived." 33 U.S.C. § 1341(a)(1). Thus, certification from a state water quality agency of compliance with state water quality standards is a precondition to obtaining a license under the FPA and the water quality certification review serves to supplement the comprehensive review of any proposed new or existing project conducted by FERC under the National Environmental Policy Act ("NEPA"), 42 U.S.C. § 4321 *et seq.*, and the comprehensive development standards of the FPA. Early in the licensing process, the state water quality agency stipulates what conditions will be included in any license issued to protect water quality.

In rendering a licensing decision, FERC must consider all beneficial public uses of a waterway, including, among others, energy conservation, navigation, irrigation,

flood control, water quality, use and supply, fish and wildlife protection, recreational opportunities and other aspects of environmental quality as well as power needs. See 16 U.S.C. § 803(a)(1). As recently as 1986, Congress—after requiring enhanced consideration of state and federal resource agency recommendation—reaffirmed FERC's role as the final arbiter of what constitutes comprehensive development of a waterway in connection with hydropower projects under FERC's jurisdiction. See *Electric Consumers Protection Act*, Pub. L. No. 99-495, 100 Stat. 1243 (1986). State water quality certification stands as an exception to the comprehensive review of all factors affecting the public interest in hydropower development that Congress has entrusted to FERC.

Inasmuch as the heart of the licensing decision under the FPA revolves around the various and often competing uses of a stream, Section 401 needs to be carefully defined, interpreted, and applied to avoid seriously disrupting this comprehensive assessment of the broad public interest mandated by Congress in the FPA. State certification under Section 401 that stipulates the conditions to maintain and protect water quality, a role the current text of Section 401 fully authorizes, provides important input to the process, but does not significantly intrude on the broad judgment balancing the uses of the waterway that is required under, the FPA. When properly conducted to assure compliance with numeric and narrative water quality criteria, this state function is rigorous but focused and provides a proper preliminary qualification from which the broader issues of competing federal, state and other public uses can proceed.

Section 602 of S. 1114 proposes an expansion of Section 401 certification authority beyond maintenance of water quality standards to include authority to "allow for the protection, attainment, and maintenance of designated uses included in the standards." This provision would allow states to prohibit or impose conditions on any use they deem inconsistent with their designated uses even in instances where the proposed use would otherwise maintain water quality in compliance with state standards. Indeed some states have erroneously interpreted their current authority under Section 401 to include this expansive authority over use of the waterway with frequently serious ramifications for the hydropower industry. Although we appreciate a state's desire to control both the quality and the use of waterways in that state, we also appreciate the need to protect the critical federal interests involved in the use of interstate waters. We believe a federal/state cooperative approach is required here to avoid unnecessary and counterproductive intergovernmental tension. Accordingly, we submit that the expansion of state authority proposed in S. 1114 is ill-conceived and would seriously undermine vital national interests that are already the subject of congressionally mandated comprehensive regulation.

Section 401 applies to "[a]ny applicant for a Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may result in a discharge into navigable waters." 33 U.S.C. § 1341(a)(1). All of these federally permitted activities are subjected to comprehensive environmental review under NEPA. Furthermore, some of these activities, including hydropower development and licensing, are subject to an additional comprehensive public interest review that, by law, includes full consideration of relevant state, interstate, federal and public interests and concerns.

Contrary to the currently proposed language in Section 602 of S. 1114, the exercise of delegated authority by state water quality agencies should not be structured to duplicate or negate such comprehensive federal review. Rather, state authority in certifying proposed activities subject to such comprehensive review under a federal statute should rest exclusively on water quality considerations, *i.e.*, the composition of the water (criteria established to support a designated use), and should not assume control over or prohibit the proposed use of the waterway.

Admittedly, this approach falls short of the complete assumption of control over the use of waterways sought by many state water quality agencies, but does so in recognition of both the vital federal interests and existing federal regulatory processes structured by Congress to assure that the activity proposed will be approved only after comprehensive review of both federal and state interests in the activity.

Under the current federal licensing and Section 401 process, states will continue to enjoy substantial influence through their participation in comprehensive federal reviews and additional federal authorities available to the states with respect to water use. State interests in water resource development beyond concerns related strictly to water quality are certainly legitimate and they are accommodated in the federal licensing process through a variety of provisions under federal law. For example, in the hydropower context:

1. Comprehensive state plans for waterways are given substantial weight under Section 10(a)(2) of the FPA, 16 U.S.C. § 803(a)(2), and FERC is required to review the consistency of any proposed hydropower project with these plans.
2. States have the opportunity to protect a stream under the Wild & Scenic Rivers Act, 16 U.S.C. § 1271 *et seq.*, and, upon approval by the Secretary of the Interior, assume responsibility for management of any stream so designated.
3. The recommendations of state fish and wildlife agencies are included in FERC licenses under Section 10(j) of the FPA, 16 U.S.C. § 803(j), unless inconsistent with the FPA or other applicable law.
4. Other state interests in matters such as recreation, aesthetics, and cultural resources are considered and integrated into—federal licensing decisions under the comprehensive development standard of Section 10(a) of the FPA, 16 U.S.C. § 803(a).

NHA believes that this approach gives full effect to the purposes of the CWA and assures full consideration of state interests while preserving Congress' intent that federal interests involved in the use of a waterway will be regulated in a manner that assures fair treatment.

This approach is also just plain good government. A frequent complaint about government is that every time there is a proposal that, when viewed in isolation, seems like a good idea, a law is passed and an additional regulatory structure created that adds yet another layer of government approval with duplicative and potentially conflicting jurisdiction. While splintering authority over a proposed activity among multiple federal and state agencies may be attractive in trying to deal with the admittedly persistent tensions between state and federal interests with respect to water use, such an approach is disastrous for any attempt to undertake any business or activity in support of the Nation's continued economic growth.

To focus this discussion on a more practical level, it seems appropriate to ask where the problem lies. We all agree that states perform a perfectly proper role in certifying that the discharge from a proposed activity will or will not meet state water quality standards. Beyond that, S. 1114 proposes that states be authorized to maintain and protect state designated uses of a stream. This principle, in the abstract, sounds like a laudable concept. But we need to look closer.

For the federally permitted activities subject to state water quality certification under Section 401, what is achieved by a state assumption of control or approval of that use? Clearly, if a state water quality agency is placed in a position to approve, condition or prohibit each such use, that agency will in essence substitute its judgment for that of the federal agency now designated as decision-maker. Is that a good idea? It may be if the federal approval process is perfunctory. It clearly is not a good idea where there is a comprehensive federal approval process assuring that vital federal interests are fairly adjudicated along with legitimate state interests. A fundamental premise of our federal system is that there are interstate interests that cannot be adequately handled by individual states, whether in the name of the CWA or by passage of a state law.

A close look at the regulation of federally licensed hydroelectric projects reveals the unintended and potentially serious consequences that could result from an unqualified transfer of control over waterway use to state water quality agencies.

A state agency could impose a level of minimum flow that it deems required to maintain water quality, and at that flow level a hydroelectric project could be feasibly developed. In addition to that flow, an agency could determine that an additional minimum flow is required for some reason unrelated to water quality. The additional flow, however, will render the project economically infeasible. A state water quality agency with no mandate or expertise to evaluate the need for project power or the economic feasibility of the development would have no reason to do anything other than impose the additional flow. (This is what basically has happened in the State of Washington and a petition for certioraris is now pending before the United States Supreme Court. See *Washington v. PUD No. 1 of Jefferson County and the City of Tacoma. Dep't of Pub. Util.*, 121 Wash. 2d 179 (1993), *petition for cert. filed*, - U.S.L.W. - (U.S. June 1, 1993) (No.92-1911)).

To support a designated use such as fishing below a dam, & water quality agency in the state where the discharge originates could require minimum flows that interfere with a licensee's responsibility to maintain the water level required upstream of the dam for navigation and recreation on a reservoir located in an adjacent state. Similarly, such minimum flows could affect a licensee's ability to comply with regulation of its reservoir for interstate flood control, municipal water supply and/or regional power supply needs.

In any of the above scenarios, we do not imply that the state interest is inferior or necessarily subordinate. The point is that state interests with respect to the use of interstate waterways are only part of the equation. To place in the control of the state water quality agencies—through the power to maintain and protect state-designated uses—the ability to prohibit or encumber uses supporting critical federal interests is the equivalent to declaring all such uses subordinate to state-designated uses and abdicating the federal government's responsibility to protect the broader interests of the Nation's waterways. Certainly such drastic action is not required to maintain the quality of our Nation's waterways.

ANTIDegradation POLICY

NHA does not oppose the development of state antidegradation policies for maintaining the integrity of our Nation's waterways. In fact, NHA recognizes that the proposal to add an antidegradation policy to the CWA essentially codifies existing USEPA policy. NHA, however, has several concerns about S. 1114.

Section 202(c) of S. 1114 proposes to add a new Section 303(b) to the CWA to require states to develop and implement a plan to maintain and protect existing in-stream uses and the water and sediment quality needed to protect those uses. Further, states must maintain and protect existing water and sediment quality even when that quality exceeds the water and sediment quality standards established as necessary to maintain and protect fish, wildlife and recreation.

State application of these standards could prevent the development of projects that propose uses other than those already existing even when the state's established water quality standards are not impaired or when existing uses are not the most beneficial. An exception to this requirement is permitted when necessary to accommodate important economic or social development as determined by the state under proposed Section 303(b)(2)(B).

NHA proposes that, as part of the comprehensive public interest reviews conducted by relevant federal agencies, *i.e.*, the Secretary of Interior, the Secretary of Energy, the Secretary of Agriculture, and FERC, be granted independent authority to make a determination regarding the importance of economic and social development based on federal interests. Where state determinations conflict with a federal determination on economic necessity, federal agencies may override the state determination as long as the federal determination is consistent with its federal authority for comprehensive review and the proposed activity otherwise complies with state water quality standards.

WATERSHED MANAGEMENT PLANS

Before NHA can meaningfully comment on the proposal to permit states to develop watershed management plans, clarification on a number of fundamental issues is required. For example, it is not clear what the intended use of watershed management plans is in the federal review of proposed projects, whether the management plan will have independent regulatory effect apart from established state water quality standards, and who makes the determination that each federal agency activity will be carried out in a manner that is consistent with the policies established in watershed management plans.

The NHA views watershed management plans as potentially helpful planning vehicles to coordinate relevant regulatory activities and provide guidance with respect to proposed activities within the watershed management unit. As such, watershed management plans could and should be treated as other comprehensive state plans, which are considered under Section 10(a)(2) of the FPA, 16 U.S.C. § 803(a)(2). Such plans could assist federal agencies and applicants for federal licenses in determining whether a proposed activity would be consistent with the state's plans for the watershed unit. As part of its overall review of a project, the federal agency must consider the consistency of the proposed activity with the state plan in making its comprehensive public interest finding.

Apparently, Section 302 of S. 1114 intends to make watershed management plans more than just state comprehensive planning documents. To the extent a determination of consistency with the plan is intended as a second tier state evaluation of whether a proposed federal activity would meet state water quality standards, we believe this mechanism would create an unwieldy and burdensome regulatory process. As a second tier review of a federal agency activity, each state could require an applicant for a federal license to meet established water quality standards for a standard Section 401 certification and then impose an additional and potentially more stringent set of criteria for a separate finding of consistency with a watershed management plan. A more appropriate approach would be to integrate the results of

the watershed planning process into the relevant requirements of existing approvals and standards.

Any independent consideration of the consistency of a proposed activity with the state watershed management plan should be conducted by the federal agencies charged with authorizing the relevant activity. The plans should be taken into account with deference by the federal agency in making its determination of the public interest in acting on a specific proposal and could be particularly helpful in assessing the relative merits of competing stream uses. The requirement that any federal activity unequivocally shall be consistent with such plans and may be exempted therefrom only on the basis of a Presidential exemption is unnecessarily stringent for this, as yet, untested program.

NHA recommends an incremental approach be adopted in implementing this watershed planning concept. This may indeed be a useful vehicle for integrating and coordinating a wide variety of activities, but Congress should not act precipitously to convert such plans into a new regulatory context with potent and largely undefined powers.

Our concerns about elevating watershed management plans to independent regulatory status are heightened by broad definition of eligible management entities for watershed management units. The wisdom and legality of vesting governmental or quasi-governmental authority in the listed entities, especially nonprofit entities, is questionable and of considerable concern.

Inasmuch as the hydropower industry could be critically affected by this watershed management planning process, we are eager to pursue this concept with you further to clarify the ambiguities in the current proposal and recommend revisions that will insure that this becomes a workable and productive initiative that will protect the valuable resources and ecological integrity of our Nation's watersheds.

NONPOINT SOURCE MANAGEMENT

Section 304 of S. 1114 proposes revisions to Section 319 of the CWA, 33 U.S.C. § 1329, with respect to nonpoint source management programs. Under the proposed amendments, the President would be required to direct federal agencies that own or manage land to implement regulations to ensure implementation of measures to control nonpoint source pollution. Through the special-use permit and rights-of-way granted under the Federal Land Policy and Management Act, these requirements would apply to federally licensed hydroelectric projects located on federal lands.

S. 1114 further proposes to require that any license or permit granted "between a Federal agency and any person authorizing activities on Federal lands" and in effect upon passage of the bill may remain in effect for no longer than five (5) years. The reference in this provision to "any Federal agency" should be deleted. Otherwise, this provision would overturn federal licenses and permits on which individuals, utilities, businesses and communities now rely. Furthermore, it would leave open the possibility that federal agencies other than federal land management agencies may be constrained by this provision. Licenses issued by FERC for periods of up to 50 years arguably could be modified contrary to Section 6 of the FPA, 16 U.S.C. § 799, which prohibits' unilateral alterations by Congress or FERC of any license issued.

Even assuming this proposed amendment applies only to permits and approvals issued by federal land management agencies, the five (5) year limitation poses serious obstacles to successfully financing and carrying out many such federally approved activities. In the case of a hydroelectric project, the expiration of any related special-use permit or right-of-way every five (5) years would present an impossible situation. The development of new hydroelectric capacity, whether at a new project or an existing dam, is a capital intensive undertaking, requiring the amortization of a substantial investment over a long period of time. The typical license for a new capacity project involving the construction of a new dam is issued for a period of 50 years. Redevelopment of capacity at existing projects is authorized with a minimum 30 year license. The security of the right to operate a project under stated terms and conditions for these time periods is a prerequisite to successful financing of this renewable energy development.

Failure to apply this five (5) year limitation to federally licensed hydroelectric projects does not mean that the regulation of these projects will not be adapted and updated to changing environmental and other needs. Licenses issued by FERC provide for future resource needs through specific license conditions that require monitoring and modifications for anticipated eventualities. FERC licenses also provide for unanticipated resource needs through standard license conditions that allow for reopening and reexamining license terms to address fish and 'wildlife, water quality and other resource needs. This examination is conducted under the comprehensive

development standard, which assures that any new conditions—although they may impose additional expense or inconvenience on a project—will not undermine the fundamental economic feasibility of project operations or other resource interests during the license term.

CONCLUSION

NHA supports a comprehensive and fair approach to maintaining and improving water quality on the Nation's waterways. As a federally regulated industry that directly uses the waterways, the hydropower industry has an overriding interest in the proper and fair regulation of that use. Any action taken that would grant states authority over the use—as opposed to the quality of—interstate waters must proceed in full recognition of federal interests in addition to maintenance of water quality. Just as the approach to resource protection has recognized the need to expand its scope to encompass entire watersheds, ecosystems, and bioregions, so too must water quality or other environmental protection legislation look beyond itself and embrace a broader universe that includes the economic, energy supply and other compelling public needs that we as a Nation must serve.

We very much appreciate the opportunity to address these critical issues facing the Committee. You are to be commended for holding these hearings and taking on the daunting task of improving the implementation of the CWA in a manner that will serve the goals of that act, while preserving equally important national policies and programs. NHA stands ready to assist in this process to assure that an improved CWA will work effectively in conjunction with such other federal statutes, including the FPA.

TESTIMONY OF WENDY NERO, WATER CONSERVATION MANGER, CITY OF TAMPA, FLORIDA

Good morning Mr. Chairman. My name is Wendy Nero. I am the Water Conservation Manager for the City of Tampa, Water Department. The Tampa Water Department is a publicly owned utility which provides drinking water to about 800,000 residents through 120,000 service connections. We have been actively implementing a water conservation program since 1989. To date, we have reduced water usage by almost 10 million gallons a day, which represents 12 percent of the city's average daily usage.

I am here on behalf of the City of Tampa and represent the views of a public utility, with regard to the water efficiency provisions of Senate Bill 1114, amending the Clean Water Act. I am also involved with the conservation committee of the American Water Works Association at the state and national level.

Introduction

The Tampa Water Department believes that the efficient use of existing water supplies is becoming increasingly important, not only in Florida but across the country. Recurring drought and population growth in areas with limited water supplies, and the costs associated with new supply development, further emphasize the need to use water wisely and efficiently.

The conservation program in Tampa grew from a combination of problems similar to the above scenario. In the 1980's, we experienced rapid population growth and saw an increase in water demands of 27 percent. This, coupled with severe drought, left us in a situation where demands for water would exceed available supplies by the middle 1990's. Conservation was originally intended to "stretch" existing supplies until new alternatives could be developed. That strategy quickly changed from one of emergency response to a long-term, water management tool.

The Tampa program is a comprehensive one which relies upon economic incentives, regulations, and education to motivate the use of water efficient technologies and conservation behavior. Our efforts target single and multi-family residential, commercial and institutional customers and seeks to improve efficiency indoors and out. The following is a brief description of Tampa's major initiatives.

Technology Based Conservation

RESIDENTIAL RETROFIT: In this program we provide single-family customers with water saving kits, free of charge. Each kit contains showerheads, faucet aerators and a displacement device for the toilet. In 1994, the city will complete the final phase of it's ongoing retrofit program—in which roughly 90,000 homeowners in Tampa will have been given a water saving kit. Program evaluations demonstrate a nine gallon per capita per day savings from this program.

TOILET REBATE: This program offers homeowners up to \$100 for each conventional toilet they replace with a low consumption model. This year we have issued 800 rebates and plan to issue an additional 2,500 in 1994. Savings are expected to be approximately 16 percent of average indoor water usage, or 13 gallons a day.

LANDSCAPE WATER AUDIT: In Florida, most landscapes require supplemental irrigation all year long. There is tremendous waste in landscape water use in Tampa and great potential to increase efficiency. Landscape and irrigation evaluations are offered, free of charge to interested residents and commercial customers. In addition, customers will be provided with a free rain shut-off device, which they must install. If we have not received installation receipts within 30 days, the customer will be billed for the cost of the device.

Educational Efforts

IN SCHOOL: Education is fundamental to the success of any conservation effort. In-school programs include a cooperative effort with the Southwest Florida Water Management District involving teacher training and a live production of a conservation play. More than 30,000 students in 40 schools will be included in the classroom training and will see the live performance.

PUBLIC EDUCATION: Additional educational efforts promote specific conservation programs offered by the City and are designed to encourage customer participation in the program targeted. Demonstration projects will also be developed to show the water saving ability of new technologies or practices.

INDUSTRY TRAINING: Additional plans for education include seminars on conservation techniques for businesses, homeowners and other water users. Workshops for the plumbing, landscape and irrigation industries are also planned. These efforts will enhance technology transfer efforts.

Utility Management

RATE STRUCTURE: Tampa is fully metered. In 1990, Tampa modified it's rate structure for all customer types. A two block structure, based on average monthly water use by customer class, was established. Once a customer exceeds it's class average a conservation rate, or surcharge, applies.

ANNUAL WATER AUDIT: Each year, we conduct an annual water audit to identify lost or unaccounted-for water in the system. This information provides the rationale for pursuing loss reduction strategies. In Tampa, the greatest reduction in unaccounted-for water could be achieved through a meter testing, repair and replacement program. A system-wide leak detection and repair program was not justified based on the results of the audit.

Regulatory Programs

CODES: Over the past several years, the City has amended ordinances to require certain conservation measures. The landscape code, irrigation ordinance and plumbing code have all been modified to maximize water efficiency. For example, the landscape code calls for native and drought tolerant plant material, the irrigation code limits lawn watering to two days per week and the plumbing code requires the use of low consumption fixtures.

Conclusion

There are several reasons why Tampa's program has been successful. First, considerable support from Mayor Freedman and other elected officials, as well as from the leadership within the water department, has been crucial. Second, grants from the Environmental Protection Agency (EPA) and the regional water management district provided funds to implement programs when we might not have otherwise. Third, technical assistance from experienced utilities, the American Water Works Association and the Southwest Florida Water Management District was key to developing expertise in Tampa.

Finally, I would like to offer a few thoughts on the proposed amendments to the clean water act.

1) EPA is assigned primary responsibility for overall coordination of Section 113, as well as administration of the Clearinghouse; but all aspects of technical assistance are to come through the Army Corps of Engineers. Both functions should reside in the same organization, and it is suggested that the EPA be the responsible agency.

2) Conservation planning needs to occur within a broader comprehensive planning context than is referenced. Integrated Resource Planning (IRP) is becoming the standard approach used by utilities. IRP is defined as "a comprehensive approach to evaluating supply-side and demand-side resource alternatives with respect to explic-

itly defined and often conflicting objectives. IRP encompasses least-cost planning, but is broader in its emphasis on an open and participatory decision making process, the use of planning scenarios that incorporate variations in uncertainty and long term community needs, and consideration of the multiple institutions concerned with water resources and the competing policy goals among them.

3) The proposed bill calls for public awareness campaigns. A provision for youth based education should also be considered, and should include curriculum as well as materials.

4) It is also stated that utilities should provide financial incentives to encourage water conservation. These incentives should also include rebates, credits and reduced impact and/or connection fees.

5) S. 1114 requires leak detection and repair. This may not be necessary or cost effective, based on the results of utility level water audits. It is preferable that an annual water audit of the utility be required instead and appropriate action taken.

6) Section (b)4.A. provides grants to "study" conservation measures. Although this is very important, it is equally important that funds be made available for project implementation as well. This could be accomplished through grants or possibly through the existing state revolving loan funds.

7) A national clearinghouse is very strongly supported, whether administered internally or through contract. This will provide necessary, well documented information for entities undertaking conservation initiatives.

Mr. Chairman, the Tampa Water Department appreciates the opportunity to present its conservation program and views on the proposed amendments to the Clean Water Act. I believe that this bill provides needed direction and establishes a positive federal role in motivating conservation. Thank you very much for the opportunity to comment.

REAUTHORIZATION OF THE CLEAN WATER ACT

WEDNESDAY, SEPTEMBER 15, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES,
AND WILDLIFE,
Washington, DC.

WETLANDS ISSUES

The subcommittee met, pursuant to recess, at 9:37 a.m. in room SD-106, Dirksen Senate Office Building, Hon. Bob Graham [chairman of the subcommittee] presiding.

Present: Senators Graham, Kempthorne, Faircloth, Reid, Lieberman and Baucus.

OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Senator GRAHAM. Let's call the meeting to order.

Today this subcommittee completes its schedule of hearings on the reauthorization of the Clean Water Act. This is the eighth in our series of hearings. Today, we will focus on the issue of wetlands.

In July, I announced that this hearing would be postponed until September to allow the administration to complete its review of wetlands policies. Since then, two relevant events have occurred. On July 28th, Senators Baucus and Chafee filed wetlands legislation for our review. On August 24th, the administration announced a set of wetlands' principles. We will review both the legislation and the administration's recommendation today.

Wetlands are generally considered to be one of our most valuable aquatic resources. That has not always been the case. Wetlands' functions and values have been historically misunderstood and misdirected policies have led to an alarming rate of wetlands destruction. Since our country was settled, we have lost half of our Nation's wetlands. We continue to lose them at an alarming rate, a rate of 300,000 acres per year. To put that in context, that means that every second, every second, we lose an the area of wetlands slightly larger than this hearing room.

Today, we understand the values of wetlands more clearly. Some estimate that half to two-thirds of our threatened and endangered species depend upon our fresh water, coastal and riparian wetlands. In Florida, for example, nearly 30 threatened and endangered species depend on wetlands for their survival. Wetland habi-

tat destruction threatens each of them, including the American Crocodile and the West Indian Manatee.

More than just the home to a rich and diverse number of species, wetlands serve critical ecological and economic purposes. Wetlands improve water quality by abating floods, recharging groundwater, trapping soil sediments and filtering water that moves through them. Wetlands also contribute 60 to 90 percent of our commercial fish catches valued at \$10 billion a year and support billions of dollars in recreational fishing. Incredibly, despite their obvious value as a water resource and despite the continued rate of loss, the word wetland does not appear in the Clean Water Act.

One consequence of the absence of clear direction from Congress has been much criticism of regulatory programs. The regulation of the discharge of dredge and fill into wetlands has been criticized as unpredictable, inconsistent and unfair. The harshest critics have seen regulation as a taking of private property. Many question whether all wetlands are the same, whether we should limit our regulation to those of the greatest value. Others point to the functions that wetlands serve and contend that we've lost too many acres of wetlands already. They urge Congress to adopt a no net loss policy.

Before we can discuss these issues, I believe we must take this opportunity to clearly articulate in the Clean Water Act, what is the national role in the protection of wetlands. To do that, we must first explore the Federal interest in protection. Most actions that are designed to protect wetlands fall within traditional responsibilities of States, responsibilities over land and water use planning. Consequently, I believe we must determine the appropriate allocation of responsibilities between the Federal Government and the States.

To help us do that, today we will hear from the administration on the proposals of the Interagency Task Force convened in response to the urging of several Senators. Most of the recommendations are reflected in the legislation which has been filed by Senators Baucus and Chafee.

We will also hear from Senator Boxer on her proposal for wetlands reform. We will review the programs in a number of States and hear from a diverse number of interested parties. We will discuss with Senator Murkowski and others problems unique to Alaska.

Significantly, we will also learn from two distinguished scientists the functions and values of wetlands in both the eastern and western United States to help guide our view of existing problems and their solution. I am struck by their statements demonstrating both ecological and economical value to the protection of this resource.

Before we begin, I would like to briefly announce how we intend to proceed when this hearing has concluded. By the end of today, the subcommittee will have held eight hearings and taken testimony of just over 100 witnesses. In addition, dozens of organizations have submitted statements for the record. We have received over 1,000 specific recommendations. Subcommittee staff has begun the process of reviewing the record and will begin in earnest the process of developing a mark-up vehicle that will incorporate many of those suggestions as well as wetlands issues which will be discussed

today. Included in that review will be over 20 separate bills that have been filed, most of which were discussed at our regional hearing on August 4th. We hope that in the next few weeks a draft of the markup will be available for subcommittee review.

At our first hearing on June 16th, I announced my intention to hold a subcommittee markup for the reauthorization of the Clean Water Act in October. We are still on that schedule. It is still the intention of Senator Baucus that the bill be presented to the full committee for mark up this fall as well.

To accommodate a scheduling problem, we will begin with a panel of Federal agencies to hear the administration position. Unfortunately, I will have to leave shortly for a brief appearance at another committee but will then return.

I wish to express my appreciation to all of the witnesses, some of whom have been of assistance to this subcommittee at previous hearings. For that, I thank you. A repeat appearance is especially appreciated.

We are joined by Senator Kempthorne, a very diligent and dedicated member of this subcommittee. Senator Kempthorne, do you have an opening statement?

**OPENING STATEMENT OF HON. DIRK KEMPTHORNE, U.S.
SENATOR FROM THE STATE OF IDAHO**

Senator KEMPTHORNE. Mr. Chairman, thank you very much. I appreciate your leadership on this entire effort.

It is an issue that I believe we definitely must resolve, not only being able to define what is a wetland, but just as importantly, what is not a wetland. While I've heard from a number of my constituents regarding many of the provisions of Senate Bill 1114, the proposed wetlands reform has perhaps sparked the broadest interest in my State. It is this area of law that has brought me back into the Constitution's protection for private property rights. It is the one that has led many average Americans, and I believe particularly those who have saved and invested in land, to view Government acts of environmental protection as increasingly slow, unpredictable, arbitrary and intrusive. I believe that many of these problems are attributable to a wetlands regulatory regime that has grown up in a haphazard manner without clear imprint by the United States Congress.

Now is the time to correct that fault. Perhaps better than at any other time in the past, we understand the unique role that wetlands play in filtering pollutants, providing natural flood protection and supporting critical habitat for all sorts of wildlife.

To that equation we can add, I hope, a greater willingness on the part of this committee and our colleagues in the Senate to minimize the kind of regulatory burdens that we impose on our fellow citizens who must live under this law. I'm encouraged by the recommendations announced by the administration. We've not seen the details but the recommendations attempt to redress some of the long-standing concerns held by my fellow Idahoans. For example, the proposal to designate the Soil Conservation Service as the lead agency for wetlands determinations on agricultural lands offers to farmers the prospect that they will have some relief from

bureaucratic indecision and delay. These are the inevitable result when different agencies assert their competing jurisdictional authority.

Likewise, the proposal to provide an administrative appeals process to challenge determinations regarding jurisdiction, permitting and administrative penalties may mean that Americans caught in the wetlands web can resolve their conflicts with the Federal Government through means other than costly litigation. On the other hand, the administration's proposals expand the statutory definition of wetlands and the scope of regulated activities within wetlands. These and other recommendations in the administration's proposal and Senate Bill 1304, the bill introduced by my colleagues on this committee, I want to review with great care.

Mr. Chairman, I look forward to working with you on this very important issue and I know that we have an outstanding panel of witnesses today and I look forward to their input in helping us resolve this issue.

Thank you.

Senator GRAHAM. Thank you very much, Senator.

We've also been joined by another very important member of this subcommittee, Senator Faircloth.

**OPENING STATEMENT OF HON. LAUCH FAIRCLOTH, U.S.
SENATOR FROM THE STATE OF NORTH CAROLINA**

Senator FAIRCLOTH. Thank you, Mr. Chairman.

I plan to keep my opening remarks short but this is a very important issue to me and I intend to pursue it with vigor.

No single issue before the Environment Committee this year is more important to all of us as a Nation than wetlands. I have spent my entire life close to the land as a farmer. I feel as though I know wetlands and their importance. There is no doubt in my mind that certain wetlands deserve the highest protection we can give them and this country's policy for 150 years, as Chairman Graham knows better than any of us, was to treat them as end uses, to drain, develop and farm them. That policy had some validity for its day but it has no place now. That, I'm aware of.

However, a lot of what is called wetlands by the Federal bureaucracy and the environmental community does not deserve the fanatical protection which it is now being given and is proposed to be given.

At the first hearing of this committee I ever attended, Senator Chafee kept saying don't use the word balance, I don't want to hear the word balance. If ever there was an issue that needs the word balance, it's the wetlands issue. The pendulum has swung too far toward the protection of so-called wetlands and what is called wetlands. I'm for protecting wetlands but everything isn't a wetland.

Farmers have become criminals, bone dry land has become navigable streams, private property has become a public preserve, oftentimes without a hearing, an appeal, or logic or any of the other processes by which we should make wise decisions and by which any other governmental decision can be appealed or questioned. It doesn't apply to the wetlands.

Chairman Baucus and Senator Chafee's wetland proposal is a step in the right direction, but a small short step. It seems to me that the Baucus-Chafee proposal streamlines a very flawed process. We need to recognize in law, regulations and treatment that all wetlands are not created equal, that private property is still a value in this country and we cannot prosper without it, and that all who impact wetlands do not deserve to be treated as Federal criminals.

As an adjunct to that, we'll take a State, Chairman Graham's. The Everglades probably has attracted more attention nationwide as an area to preserve than any other wetlands in the Nation by far. This process of draining the wetlands began at the turn of the century. In 1916, the builder of the Tamiami Trail brought the flow of the Shark River into the Gulf. There was continuous drainage as most of the wetlands in this country have been drained. They've been drained by the Federal Government. The private sector never had the money to do it. The SCS, for years and years and years, paid for engineering, design and the cost of drainage canals. The entire Florida drainage system began in the Everglades in 1926 which then followed with pulping, levees, and was all Federal without which there would be very little intrusion upon the Everglades.

Senator Graham, as Governor in the early 1980's, began to reverse this trend, as well he should. So he is aware, but I think we need to bear in mind that the drainage of the wetlands of the United States was not an act of the private sector but an act of the public sector and the Corps of Engineers and the Soil Conservation Service. I believe we need to bear that in mind as we move through this today.

Senator GRAHAM. Thank you, Senator.
Senator Reid?

OPENING STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE OF NEVADA

Senator REID. Thank you very much, Mr. Chairman.

I appreciate your arranging this meeting. I want to commend you for the work that you've done on the subcommittee and certainly on the Clean Water reauthorization issue during the past few months.

The subject of this hearing, wetlands, is one more major policy debate facing this committee and the Nation that I think desperately needs a solution. We must resolve this problem so we can get on with protecting these valuable wetlands and the economic sector of the country can continue to grow and produce jobs.

It is often said that issues like wetlands are not as significant in areas like Nevada where people surmise there are few, if any, wetlands because of the arid nature of the State. The fact of the matter is, we certainly have much less area in wetlands than States like Florida and Alaska and many other States, in fact, most other States, but those we have are extremely important.

Most people don't realize that we have the only link for migratory birds going south and then north. If it weren't for the Stillwater Marshes, the number of migratory birds would be cut down significantly. So I've been involved in trying to restore these extremely

valuable wetlands known as the Stillwater Marsh in the northern part of Nevada and we're making some progress.

There are projects in the southern part of the State to create and restore wetlands that I support as well, but in truth, when you have few wetlands to protect, it becomes even more important that we protect them, at least we think so.

I've seen the new proposal the administration has issued on wetlands and combined with the bill the committee has offered, it appears to me that we are on a course in trying to work out this most difficult issue. I certainly want to extend my hand of cooperation to you.

I also want to make a brief mention of another issue the committee finds itself confronted with. I make it now because there is no other time to make the statement and that deals with the Safe Drinking Water Act reauthorization. I've also seen the administration's proposals on this issue and I'm encouraged but not totally satisfied by the points that they've made in regard to assisting small water companies in the communities that they serve across the Nation, particularly in rural areas in the West, especially in Nevada. I remain concerned about how we can develop and implement these ideas in a new Safe Drinking Water Act.

Many of these companies and communities are hard pressed to find the money to build new systems and have little or no hope of finding regional or other solutions to their drinking water problems. I believe this committee has an obligation to go the extra mile and ensure that the hardships we place on these communities and the residents, many of whom are on fixed incomes and cannot afford for their water rates to increase. I had one company indicate that they would go up as much as 1,000 percent. We have to do something to mitigate these to the maximum extent possible in our efforts to resolve the policy issue.

The Administration has made a recommendation to ensure the viability of small systems, to maintain half of them, half of them probably would not be able to exist, but at least have some ability to phase them out so there would not be any violent damage done to the community and the areas they serve.

In the future, I intend to offer additional comments on how we can build on some of the ideas the administration has offered regarding clean drinking water.

Once again, I look forward to working with you and the members of this committee on the two issues that I've talked about today, wetlands and clean drinking water.

Senator GRAHAM. Thank you very much, Senator.
Senator Durenberger of Minnesota.

**OPENING STATEMENT OF HON. DAVE DURENBERGER, U.S.
SENATOR FROM THE STATE OF MINNESOTA**

Senator DURENBERGER. Mr. Chairman, thank you.

In 1991, the Environmental Protection Subcommittee held a series of hearings on wetlands and at that time, I had the opportunity to offer a short list of reforms that I thought would make Section 404 of the Clean Water Act work better. I'm pleased that S. 1304, the bill introduced by the leadership of this committee cov-

ered most of those items. I want to commend Senators Baucus and Chafee for the balanced bill they've presented.

The five items that I listed in 1991 started with a greater role for the States. I asked that we look for opportunities to enhance the State role in addition to the delegation of section 404. The watershed planning and general permit provisions in 1304 provide the flexibility necessary to assure broader State and local participation in the program.

Second on my list was an expansion of the jurisdictional activities under section 404 to include drainage, channelization, and excavation which may adversely affect wetlands. That item is not only in the Baucus-Chafee bill but it is also in the bill introduced by Senator Boxer and it is in the bill offered by Congressman Hayes on the House side. So it seems to me that is a consensus to fix 404.

Third on my list was a concern for the general permits issued by the Corps of Engineers. We have to find a mechanism to ensure that the wetlands losses resulting from the nationwide permits are offset by gains. S. 1304 recognizes the problem both in the goal it establishes for a long-term net gain in our wetland resources and in the requirement that Federal agencies account for the cumulative impact of losses under the general permits issued by the Corps.

At the time of our 1991 hearings, the Delineation Manual was at the top of everyone's list of wetlands issues. Now we're awaiting a National Academy of Sciences report on the science that should inform delineation decisions. Those that have criticized the section 404 program for its deficiency in the science underlying some decisions have been right on the mark. The NAS report should help answer these questions.

In addition to better science, I urge that any future revisions to the manual be made on the public record with a full opportunity for public comment. I'd hasten to add that the manual should continue to be a scientific document and not a reflection of the public policy dispute about how much of the resource we ought to preserve. S. 1304 requires a revision to the manual to be an informal rulemaking with full opportunity for public comment.

S. 1304 squarely addresses each of these issues in a balanced way and deserves our support, but I do have one additional concern which is not addressed in S. 1304 and maybe it's beyond the reach of this committee but I hope not.

Some of our witnesses today will point out that 75 percent of our wetlands resources are in private hands, that we can never have a successful conservation program without recognizing the private role, and I agree. We have to provide conservation incentives for landowners. The whole thing here is an issue of accountability, do you want negative accountability, the \$25,800 a day penalties that my colleague from North Carolina just pointed out to me or do you want some positive accountability. I say this particularly on behalf of farmers and ranchers because in my State—I think the ranking member of this committee who said he's never seen a wetland restoration could come to my State and see some of them. A lot of them that he comes to see are going to be private restorations as well as combinations of public and private and so this whole issue with positive incentives to owners I think is critical.

I'm not talking about a full compensation through public taking, imminent domain as a requirement for any wetlands class as critical habitat. That would be a formula for less in my view rather than more wetlands protection. There have to be ways to encourage the private interest in wetlands conservation and I hope in this audience today there are people who have thought about this longer, deeper and broader than I. I know Senator Boxer's bill includes some of these options and I hope that we can explore this side of the question more fully.

Having said that, Mr. Chairman, you can count on me as one member of the subcommittee who will enthusiastically support inclusion of 1304 in the Clean Water Act reauthorization legislation.

Senator GRAHAM. Thank you very much, Senator.

Senator Lieberman of Connecticut?

**STATEMENT OF HON. JOSEPH I. LIEBERMAN, U.S. SENATOR
FROM THE STATE OF CONNECTICUT**

Senator LIEBERMAN. Thank you, Mr. Chairman.

I congratulate you for convening this hearing which is an ambitious one on such an important and complex issue.

This Senate Committee on Environment and Public Works is fortunate to have your leadership in this matter as well as the leadership of Senators Baucus and Chafee, both strong supporters of wetlands protection.

The environmental community also deserves some credit for bringing us to this point, I believe. Their consistent fight to elevate discussion of wetlands regulation to a discussion of wetlands values, which is to say what we give up when we give up swamps and marshes and bogs and fens, has helped to set the stage for what I believe is a major breakthrough by the Clinton Administration in addressing the problems associated with wetlands loss in our country.

Most people in this room know that the Clean Water Act's 404 Program was not designed for the sole purpose of protecting against wetlands loss. In some sense, our Nation and our Government backed into a wetlands policy. If 404 had been designed for the sole purpose of protecting against wetlands loss, the activities which it regulates would not be limited to the disposal of dredge or fill material, nor arguably would we have designed its regulatory structure in quite the same way. If we were designing a program to give wetlands protection under the Clean Water Act, we certainly would have noted up front the functional values of wetlands, which is to say why it is we care about preserving them at all. Vernal pools, salt marsh, prairie potholes, these are not terms easily worked into the every day vocabulary.

A comprehensive program to protect wetlands would have given us a picture of them nonetheless and what they do for us. We'd see their connection to the rest of the Clean Water Act and their importance to the rest of our environmental statutes. Wetlands, after all, store flood waters and they keep our drinking water pure. Without them, we must pay to build the infrastructure to perform these same functions.

In Connecticut, the coastal wetlands service shellfish nurseries. They filter urban and agricultural runoff before it hits Long Island Sound. The forested wetlands of New England are where rare songbirds and other endangered species summer before heading to the tropical forests of Costa Rica. So there are many connections here that we would have noted.

If protecting wetlands had been stated as a priority in the Clean Water Act, we also would not have created a regulatory structure that at times enraged the very people we were hoping to work with in order to protect that resource. Since the vast majority of wetlands are on private lands, we certainly would not have sought to alienate private landowners or would-be developers.

By the same token, we wouldn't have sought to make it difficult for States or municipalities to get a quick answer on whether or not they could go forward with a project that had a wetlands impact. Flood control, drinking water purification, important fish and wildlife habitat all add significantly to a community's quality of life, and so do, of course, roads and housing and farms and harbors and managed forests.

Our efforts should be directed at ensuring now that whenever possible we can have them all or at least as many as possible, not pitting one group of societal goals and functions and values against another. This is where I think the Clinton Administration is to be most commended. The document released by the White House Office on Environmental Policy is one of the most lucid attempts that I at least have seen to try to not only rethink but recreate our Federal wetlands policy and programs. I commend the administration for identifying the problems and tackling them head-on.

This is not to say, of course, that the report is beyond questioning. For instance, while the report endorses mitigation banking, it does so conceptually reflecting the need for much more development of this idea. I note also, however, that any mitigation banking endorsement by the administration would be linked to comprehensive watershed planning which makes excellent sense. I would add that I was particularly impressed by the report section on the perils of national classification.

The heart of the interagency agreements seems to be the consolidation of Federal responsibilities for wetlands protection, assigning primary responsibility for wetlands decisions on agricultural lands to the Soil Conservation Service with assistance from the Fish and Wildlife Service, seems to me to be a sensible and necessary change.

So, Mr. Chairman, I think we have here an opportunity not to repeat what has happened up until now, which is to back into a national wetlands policy which was too often divisive, but in fact to create one head-on and so far as possible, to make it a policy that is not only productive and protective, but unifying.

Thank you.

Senator GRAHAM. Thank you very much, Senator.

If I could, I'd like to ask if you could chair the hearing for the next few moments. I must leave to participate in another hearing.

Our first panel consists of Mr. Jim Lyons, Assistant Secretary, Natural Resources and Environment, U.S. Department of Agriculture, who will be the principal spokesman for the administration's

wetlands policy; Mr. Robert H. Wayland, III, Director, Office of Wetlands, Oceans and Watersheds, U.S. Environmental Protection Agency; Dr. G. Edward Dickey, Acting Assistant Secretary for Civil Works, U.S. Corps of Engineers—Dr. Dickey, we appreciate your being with us again; Mr. Don Barry, Counselor, Office of the Assistant Secretary for Fish and Wildlife and Parks, U.S. Department of the Interior; and Mr. Doug Hall, Assistant Secretary, U.S. National Oceanic & Atmospheric Administration, U.S. Department of Commerce. Those will be the participants in our first panel.

While the panel is coming to the table, I want to acknowledge receipt of statements from Senators Breaux and Pryor and, without objection, they will be included in the record.

[The statements referred to follow:]

STATEMENT OF HON. JOHN BREAUX, U.S. SENATOR FROM THE STATE OF LOUISIANA

Mr. Chairman, thank you for conducting this hearing on the very important issue of federal wetlands regulatory policy as part of the Subcommittee on Clean Water, Fisheries and Wildlife's work on the Clean Water Act reauthorization. The wetlands regulatory program has not been debated by Congress since 1977. I also extend my thanks for focusing on this critical environmental issue to the Chairman and Ranking Minority Member of the Committee on Environment and Public Works, Senators Baucus and Chafee.

I would have liked to have had the opportunity to appear before the subcommittee, but I am joining the President in Louisiana today on other matters which also are important to my state.

One of the defining characteristics of Louisiana is its vast amount of coastal and river bottom wetlands. Louisiana possesses 40 percent of our nation's coastal wetlands which, in turn, support the nation's most abundant fishery. Unfortunately, Louisiana also has suffered some of the most significant wetlands losses in the nation due both to natural occurrences and the actions of man.

Today, over 50 percent of our state is considered to be a federal jurisdictional wetland, with over 75 percent of that land in private ownership. Thus, in my state, the federal wetlands regulatory system is a very important program, not only with respect to the ongoing efforts to conserve our state's wetlands resources, but also with respect to necessary governmental infrastructure activities, private sector economic activities, and the rights of private landowners.

The current federal regulatory system, which has been developed over the last fifteen to twenty years, primarily through agency initiatives and judicial decisions, works neither for the environment nor for private landowners and land users.

With the introduction of S. 1304, the "Wetlands Conservation and Regulatory Improvements Act", by the Committee Chairman and the Committee's Ranking Minority Member, Senators Baucus and Chafee, and with President Clinton's announced wetlands policy plan, Senate debate on a national wetlands policy promises to be challenging and lively. I certainly look forward to it.

I take this opportunity to thank President Clinton for responding to the request of several of my colleagues and myself to form a White House Task Force to develop wetlands policy proposals. The President's recommendations are a first step in the right direction and are positive for the most part. Many of the details still need to be developed and refined. The recommendations establish a framework that we can work with in the days and weeks ahead as we debate amendments to the Clean Water Act.

Wetlands policy affects private landowners primarily. As such, any wetlands policy needs to be efficient, fair, and flexible. It must be administered in a manner which avoids unnecessary and unfair impacts upon private property and the regulated public.

Federal wetlands policy cannot consist primarily of avoidance of all economic activity on all wetlands. The President's plan, in particular, seems to add some flexibility to the current process for determining whether a permit for wetlands activity should be issued.

Some other key features of a national wetlands policy must include wetlands restoration, so critical to Louisiana; mitigation banks; coordinated wetlands regulation between the federal and state governments; an appeal process for private landown-

ers and an end to the difficulties the agriculture community has suffered under the current program.

In addition, wetlands need to be classified by functions and values. Not all wetlands possess the same functions and values. A regime needs to be established which not only recognizes this, but also implements an effective, usable classification system. Without such a system, our national policy will not square with the reality of the nation's diverse wetlands resources. Without such a system, all wetlands essentially will continue to be treated equally for regulatory purposes, which makes no sense and ignores reality.

Preserving the rights of landowners and providing an efficient method for compensating those landowners who lose the use and value of their property due to the operations of a wetlands program also must be addressed and contained in a national policy. These are some of the wetlands issues about which I continue to be concerned, Mr. Chairman.

The executive summary to the report of the National Performance Review is entitled, "From Red Tape to Results Creating a Government that Works Better and Costs Less". On page 8 of that summary, Vice President Gore is quoted from a March 26, 1993 statement, which I repeat here in part, "We are going to rationalize the way the federal government relates to the American People, and we are going to make the federal government customer friendly. . . ."

I believe, Mr. Chairman, that the Senate, the Congress and the nation must be about the business of creating a government that works better and costs less when it comes to developing and implementing a wetlands policy. We must make wetlands policy customer friendly. We must make wetlands policy work better and cost less.

Throughout the debate on wetlands, we must be always mindful of one key fact, that a significant portion of our wetlands are privately owned. In being mindful of this reality, we must be vigilant in our responsibility to develop and carry out a customer-friendly policy, one which works better and costs less and one which respects private property rights and treats private landowners fairly.

Thank you for allowing me to submit this statement to the subcommittee. I ask that it be included in the record of the hearing. I look forward to working with you, the committee and other Senators as we attempt to develop a balanced federal regulatory policy that works for the environment and for landowners, for state and local governments and for the economy.

STATEMENT OF HON. DAVID PRYOR, U.S. SENATOR FROM THE STATE OF ARKANSAS

Mr. Chairman, I commend this Committee for meeting today to take on the controversial and important wetlands debate. This issue confuses and frustrates so many Americans, including our farmers and ranchers, and I am delighted to see the Congress addressing this in what I hope will be a complete and comprehensive manner. In our effort, we face the challenge of balancing the wetlands as an environmental treasure and a natural resource. I appreciate the opportunity to provide my input on how our government should manage these lands.

Let me also commend the Clinton Administration for tackling this contentious issue by putting together an interagency working group that has developed what many have called a balanced and positive approach to solving this dilemma.

The confusing regulations and policies which have evolved over the years are largely due to agency regulations and court decisions as opposed to statutory guidance. Because the Corps of Engineers, the Soil Conservation Service, the Fish & Wildlife and the Environmental Protection Agency have all had a hand in past wetlands policy implementation, people across America have been baffled as to which organization has either the ultimate responsibility or the most useful information to resolve wetlands disputes.

Hopefully, the constructive approach used by the Administration and the willingness of Congress and others to work on this matter will be the shot in the arm this debate needs.

To assist in this effort, Senator Stevens and I recently formed the Senate Wetlands Caucus. We want it to provide a means for all senators to share information and provide input during this legislative process. So far, members of the Caucus are cautiously optimistic that the process can yield real results.

From Alaska to Arkansas, wetlands regulation affects a broad spectrum of unique situations and an equally broad spectrum of Americans. The caucus will help to

highlight the variety and gravity of the issues that must be addressed in the wetlands discussion.

I should point out that even since Senator Stevens and I introduced the Wetlands Caucus on the Senate floor earlier this year, there has been significant progress and more reason to hope for an equitable resolution. With the Clinton Administration Interagency Task Force work and S. 1304, the bill introduced by Senators Baucus and Chaffee, I believe we have an appropriate starting point to begin debate.

The interest of this committee, Administration involvement, legislation, the Caucus, and a willingness by most parties to roll up their sleeves and iron out differences—all add up to a workable framework for real progress.

Mr. Chairman, we stand at a point of great opportunity in a long and emotional debate. We must take this opportunity to reach toward new understandings that will eliminate the confusion and ambiguity that exists in our current wetlands policies.

I know I can say on behalf of the Wetlands Caucus we want to work with this Committee and all others to develop laws and regulations that are both concrete and reasonable.

Again, I thank you for this opportunity to testify before the Committee.

Senator GRAHAM. Mr. Lyons, why don't you begin?

STATEMENT OF JAMES R. LYONS, ASSISTANT SECRETARY, NATURAL RESOURCES AND ENVIRONMENT, DEPARTMENT OF AGRICULTURE, ACCOMPANIED BY ROBERT H. WAYLAND, III, DIRECTOR, OFFICE OF WETLANDS, OCEANS AND WATERSHEDS, ENVIRONMENTAL PROTECTION AGENCY; G. EDWARD DICKEY, ACTING ASSISTANT SECRETARY FOR CIVIL WORKS, U.S. ARMY CORPS OF ENGINEERS; DON BARRY, COUNSELOR, OFFICE OF THE ASSISTANT SECRETARY FOR FISH AND WILDLIFE AND PARKS, U.S. DEPARTMENT OF THE INTERIOR; AND DOUG HALL, ASSISTANT SECRETARY, U.S. NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION, U.S. DEPARTMENT OF COMMERCE

Mr. LYONS. Thank you very much, Mr. Chairman and members of the subcommittee.

It is an honor to be here representing the administration and to present to you our proposed attempt to deal with the wetlands policy issues that have plagued the United States for some time now.

Let me make clear that this statement is being presented on behalf of not only the Department of Agriculture, but also the Environmental Protection Agency, the Army Corps of Engineers, the Department of the Interior and the National Oceanic and Atmospheric Administration. This joint statement, I believe, demonstrates the tremendous cooperation and coordination among the Federal agencies that have participated in the Interagency Working Group on Federal Wetlands Policy that has produced the administration's wetlands proposal which we present to you today.

Senator LIEBERMAN. [presiding] Mr. Lyons, let me just intervene for a courtesy and kind of a notification. It is our custom in the committee to use timing the so that we can hear everyone. The lights are on an 8-minute cycle. So we'd appreciate it if when the red comes on you could try to draw to a close.

Mr. LYONS. I'll try to work on an 8-minute cycle.

Senator LIEBERMAN. Thank you.

Mr. LYONS. Three weeks ago, the administration, as you know, released a comprehensive package of improvements to Federal wetlands policy and we believe this package reflects a broad-based consensus within the Executive Branch and clearly it's a departure

from the gridlock of the past and contains what we believe is a balanced, common sense, and workable set of initiatives that will make Federal wetlands policy fairer, better coordinated with State and local efforts, and more effective in protecting wetlands.

What I'd like to briefly do this morning is to discuss the process by which we put together this proposal and some of the key elements of the package.

The Interagency Working Group was formed in response to a request to President Clinton from seven Senators as Chairman Graham indicated. The purpose of the group was to provide a forum to allow the appropriate Federal agencies to work together with input from members of Congress and the public to develop a consensus on wetland policy issues. The group was convened by the White House Office on Environmental Policy in June and included nine agencies—the Environmental Protection Agency, the Army Corps of Engineers, OMB, and the Departments of Agriculture, Commerce, Energy, Interior, Justice and Transportation.

In addition to the Interagency discussions, which occurred over a long period of time, the working group solicited the views of a broad range of stakeholders representing all perspectives in the wetlands debate, including members of Congress, representatives of State and local government, environmental interests, the development community, agricultural interests, and the scientific community. With this information in mind, the group met intensively and developed proposals that we have to present to you today.

The Administration's plan includes both regulatory improvements and what we believe are innovative, nonregulatory approaches to protect and restore wetlands. It includes administrative actions, some of which took effect immediately, and others that will begin during the coming months. It also includes legislative recommendations for Congress' consideration during reauthorization of the Clean Water Act. Some of the themes of this package are consistent with those addressed in S. 1304 as well as S. 1114.

At this time, I'd like to highlight some of the specific elements of the policy. A guiding principle in formulating the policy was to exercise strong Federal leadership while empowering State and local action. The Administration believes that the Federal Government should lead by example as well as by directive. To this end, the existing Executive Order on wetlands will be revised to establish an interim goal of no overall net loss of wetlands and a long term goal of increasing the quantity and quality of wetlands in the United States. We are pleased to note that S. 1304 establishes the same short and long term goals as does the administration's proposal. The revised Executive Order will also direct Federal agencies to take a watershed or ecosystem management approach to wetlands protection and restoration in working toward these goals.

The Administration policy also identifies voluntary, nonregulatory wetlands restoration as an essential vehicle to achieving these goals. The Wetlands Reserve Program is a crucial part of the administration's wetlands restoration plan. The 1990 Farm Bill requires a minimum of 1 million acres to be enrolled in the WRP by the end of fiscal year 1995. The Reconciliation Act from 1993 amended the WRP acreage provisions to require not less than 330,000 acres be enrolled by the end of 1995, reduced the minimum

acreage target to 975,000 acres and extended the enrollment period to the year 2000.

In 1992, a 50,000 acre pilot project was very well received. In fact, we had proposals from 2300 farmers to restore nearly a quarter of a million acres of wetlands. The fiscal year 1994 agricultural provisions provide for 75,000 new acres to be enrolled and would more than double the number of States eligible for participation in the program. Under the policy, the administration will use this program in the Midwest in conjunction with emergency assistance programs to help restore wetlands and assist farmers affected by the recent flooding in the Mississippi.

In addition, the administration will examine opportunities to expand existing Federal programs that seek to restore wetlands through cooperative, voluntary agreements with private and other non-Federal landowners. The Administration is pleased to note that S. 1304 also promotes a similar wetlands restoration effort.

To increase State and local roles in wetlands protection and to reduce duplication between wetland protection programs on different levels of government, the administration encourages the Congress to adopt several measures.

The first is to authorize the development of State-tribal watershed protection programs which should provide for local and regional involvement and Federal approval of State programs, including minimum requirements for wetlands protection and restoration planning.

In addition, the administration recommends that Congress provide EPA with the authority to use its Wetlands Grant Program to fund both the development and implementation of State-tribal wetlands conservation plans. Congress should also authorize partial assumption of the section 404 Program by States and tribes as an interim step toward full assumption.

Finally, the administration recommends that the Congress should amend section 404(e) of the Clean Water Act to provide explicitly for the issuance of programmatic general permits with appropriate environmental safeguards for approved State, tribal, regional and local regulatory programs. Most of these measures, with the exception of those related to the assumption of section 404 programs, are in S. 1304.

The Administration policy will streamline and clarify wetlands programs affecting the agricultural community, something that we've debated long and hard in recent years. At the heart of this effort is a commitment on the part of all Federal agencies to minimize duplication and reduce inconsistencies between the swampbuster program provided for in the Farm Bill and section 404 programs provided for in the Clean Water Act.

To that end, the Soil Conservation Service will be the lead Federal agency for wetlands determinations on agricultural lands for both programs, in consultation with the Fish and Wildlife Service and under the programmatic oversight of the EPA and the Corps. The SCS will use agreed-upon methods that are consistent with those used by EPA and the Corps and will participate fully in an interagency training program to ensure that field personnel are properly trained.

In addition, the administration has issued a final rule that affirms the exclusion of an estimated 53 million acres of prior converted crop lands from Clean Water Act jurisdiction. These are areas that prior to December 1985 had been cropped and hydrologically manipulated to the extent that they no longer perform the functions they did when in their natural condition.

Consistent with S. 1304, the administration recommends corresponding congressional action to define the term "waters of the United States," in the Clean Water Act to exclude prior converted wetlands.

The Administration policy also addresses landowner concerns regarding the section 404 Program. The Corps will develop through rulemaking an administrative appeals process under the regulatory program so that landowners, farmers and others can seek review of jurisdictional determinations on permit denials without going to court. The Corps will also modify its regulations to impose deadlines to ensure that permitting decisions are made in a timely fashion. The policy also endorses the use of mitigation banks for compensatory mitigation under the section 404 Program with environmentally sound limits.

The Clinton policy takes several steps we believe to increase the predictability and public acceptance of efforts to identify areas as wetlands subject to the jurisdiction of the Clean Water Act. Use of the 1987 Wetlands Delineation Manual has provided a workable and broadly accepted delineation procedure over the past two years. The Administration supports continued use by all agencies of the 1987 manual pending completion and review of the National Academy of Sciences study which we expect to have in September of 1994. To increase public confidence in the Section 404 Program, the administration is also recommending congressional endorsement of continued use of the 1987 manual which again is provided for in S. 1304.

To put to rest the notion that Congress did not intend to protect wetlands in the Clean Water Act, the administration recommends that an explicit definition of the terms "wetland," and "waters of the United States," be included in the statute consistent with long-standing regulatory definitions. S. 1304 includes such a definition as well.

The plan recommends that Congress affirm these definitional changes in legislation, as does S. 1304, for the discharge of dredge or fill materials.

In conclusion, Mr. Chairman, we believe that this reform package represents a tremendous opportunity to move beyond the polarization that has characterized the wetlands policy debate in recent years. As indicated in this testimony, there are many similarities between the administration's policy and the provisions of S. 1304. We look forward to working closely with the committee to enact bipartisan legislation that will improve wetlands protection in the United States.

I want to thank you for this opportunity to appear before you and welcome any questions you might have to offer.

I also want to acknowledge my colleagues and partners who worked many hours to put together this policy program.

Thank you, Mr. Chairman.

Senator LIEBERMAN. Thank you, Mr. Lyons.

I gather that the other folks on the panel are not going to make opening statements but will be available for questioning.

Mr. LYONS. That is correct.

Senator LIEBERMAN. I appreciate that.

We'll run the clock on ourselves. Why don't we do it for five minutes for the members?

I'd like to address the structure of the statute and the way you dealt with it. I made reference to it in my opening statement, that so much of the authority we now invest in 404 for the purpose of protecting wetlands resources is really the result of court rulings. I wonder if the administration feels, that we've reached the point where we should be coming out and stating clearly the value of wetlands, why we should protect them, perhaps expanding on a list of the activities unacceptable in a wetland without a permit and perhaps having a separate title of the Clean Water Act that would deal specifically with wetlands. Mr. Wayland, do you want to answer that?

Mr. WAYLAND. Yes, Senator Lieberman.

Indeed, we do agree that the time has come and is perhaps past due to have a comprehensive and cogent series of provisions in the Clean Water Act which recognize the importance of wetlands and establish a framework for their protection.

Just to sort of illustrate the nature of the folklore and controversy that has grown up in this program, it is true that much of the current program has been implemented as a result of an evolution in our understanding of the value of wetlands and evolution in the regulatory tools to protect them. However, the word wetlands does indeed appear in the Clean Water Act but the folklore, of course, holds it has been repeated so often that even experts sometimes will assert that term does not appear in the statute. It is certainly the case that we can't look to the Clean Water Act and find the kind of comprehensive and straightforward provisions that would be extremely helpful to those of us who are trying to implement that statute.

Senator LIEBERMAN. I appreciate that. We look forward to working with you on that.

Let me ask about mitigation banking which is a topic around which some controversy swirls. I note that the administration's policy document endorses mitigation banking conceptually. I wonder if you would develop that a little bit, anybody on the panel. Let me just pose a few questions. Should mitigation banking be like kind; does everyone agree that if a rare coastal wetland or wetlands are taken that their loss should be compensated for by restoring other previously damaged coastal wetlands; should the compensation occur in the same State or in the same region? Just, if you would, develop the administration's thinking on mitigation banking a little bit beyond the conceptual.

Mr. DICKEY. Let me say something from the Army's perspective on mitigation banking. I think the focus is that we want to restore or mitigate the values and functions that would be lost by the permitted activity. So that would certainly be one principle, and if you accept that principle of maintaining functions and values, then you look for similar areas, similar geographic locations and so forth.

It is important to keep in mind that the use of mitigation banking, however, does not preclude or abolish the requirement to go through the sequencing process of avoidance and minimization and we really look to mitigation banking as a way that in certain circumstances, can offer a more attractive proposal or alternative to on-site mitigation. There's generally a preference for on-site mitigation because that is most likely to give you exactly the same values and functions but there are disadvantages there, particularly when you have isolated mitigation lands. It is very difficult, on a small scale sometimes, to restore the same values whereas if you have a bank, you do it on a large scale and you can get a better restoration of the functions and values that you lost. Also, you can have better management when you have a large tract. Also it simplifies the monitoring process.

One thing we are very concerned about is when you do have mitigation that you in fact monitor the Federal agencies, monitor to ensure that mitigation remains effective over time.

Senator LIEBERMAN. Who would monitor under mitigation banking?

Mr. DICKEY. I believe that the Corps or EPA. Again, this is something which we are going to be working out in our detailed guidance on this.

Senator LIEBERMAN. What is an appropriate period for monitoring?

Mr. DICKEY. I would say indefinitely. The idea is the values there.

Senator LIEBERMAN. I note that the administration endorses mitigation banking in the context of comprehensive watershed planning at the State level. Is that something that we should specifically write into the Clean Water Act reauthorization?

Mr. WAYLAND. Senator, if I could, both S. 1114 and S. 1304 do have watershed management provisions that we believe are a useful starting point for establishing the kinds of programs we think would help us to more effectively identify areas where restoration, be it in connection with the mitigation bank or private restoration effort or a public restoration effort, will have the greatest return for the environment from the public or private expenditure involved.

Senator LIEBERMAN. Finally, on this subject, are there successful examples of mitigation banking that we can point to now?

Mr. WAYLAND. There are about 100 operating or planned mitigation banks around the country of various sizes and scales, most of them relatively recent in their operation and it may be premature to declare any of them a complete success at this juncture. Most of them have been established for relatively specialized purposes, for example, to mitigate for transportation projects. I think the hope is that we may be able to see their availability broaden so that rather than having small developers undertake two acre restoration projects with limited prospects of success that we can, as Dr. Dickey said, have larger scale, more appropriately located and more professionally managed restoration efforts.

Senator LIEBERMAN. Thank you. My time is up.

Senator Faircloth?

Senator FAIRCLOTH. Senator Kempthorne was first.

Senator LIEBERMAN. I'm sorry, Senator Kempthorne.

Senator KEMPTHORNE. Thank you, Mr. Chairman. Thank you, Senator Faircloth.

Mr. Lyons, if I may start with you, from the Department of Agriculture's perspective, could you please give me some insight as to some of the adverse impacts that the current situation concerning the definition of wetlands has had upon the farmers and ranchers of the United States?

Mr. LYONS. Well, Senator, I think the most obvious adverse impact is confusion, frustration and downright anger about the fact that there was lack of certainty as to what constitutes a wetland; what does not constitute a wetland. I think Senator Faircloth also alluded to this. Frankly, from the standpoint of what was applied under Swampbuster, and then what was applied under section 404. That is one of the reasons we seek to provide a single authority for making determinations on the ground so as to clarify for agricultural producers that they have to deal with one agency on the ground with regard to determinations and not live under the uncertainty that a ruling made by one Federal agency may be different from a ruling made by another.

Senator KEMPTHORNE. Is there consensus that this truly has been a difficult situation for the farmers and ranchers?

Mr. LYONS. I don't think anyone could doubt that, Senator.

Senator KEMPTHORNE. If I may, Dr. Dickey, a question for you. Could you describe for me the manner in which an average American comes to find out that he or she has wetlands on their property that fall under your jurisdiction? Is the burden on the citizen to realize that he or she has wetlands and obtain a permit from you and what guidance is there when the area or the land at issue is open to interpretation insofar as it is or is not wetland?

Mr. DICKEY. There is a burden on the landowner and I think that the we have worked hard to publicize the existence of the 404 Program and the indicators, if you will, of wetlands and we are available to make jurisdictional determinations when a landowner suspects that indeed wetlands may be present.

Senator KEMPTHORNE. What guidance do you give to landowners throughout the United States where they simply may not believe that they have a wetland and yet the liability apparently is that the burden of proof is on who?

Mr. DICKEY. I think the burden of proof is in terms of the criteria that are established there and in terms of hydrology, in terms of the soils, and in terms of the vegetation. As I said, we have undertaken extensive education efforts to make available to the public information concerning wetlands. I think there is an exaggeration here of the obscurity by which one knows whether there is a wetland or not. I think it really is not that big an issue, that people are aware of the regulatory program and are aware under the circumstances where they may have wetlands on their property.

Senator KEMPTHORNE. Let me just continue that. Does a system of strict liability make sense in a context where it is not always clear to a person that the land in question is or is not a wetland, particularly where criminal penalties, fines and jail terms are imposed in some cases where the Corps dispute has been over whether the land in question is a wetland?

Mr. DICKEY. I'm not a lawyer and would like to supply something for the record on that particular question. Perhaps Mr. Wayland would like to address it as well.

Again, I think that you will find that the resort to criminal penalties and so forth is a very rare instance, that whenever there arises a case of where there has been an inadvertent activity in a jurisdiction wetland, the Corps as a matter of policy looks to after-the-fact permits and restoration as a way of handling the issue as opposed to taking court action.

Senator KEMPTHORNE. For the record, Mr. Dickey, I'm not an attorney either.

Senator LIEBERMAN. Usually that elicits a stirring round of applause.

[Laughter.]

Mr. WAYLAND. If I could just supplement that a little bit because under the Memorandum of Agreement with Army on enforcement, EPA generally takes responsibility for addressing instances where an activity has occurred without a permit which should have required a permit. I just want to emphasize Dr. Dickey's point that the criminal penalties are reserved for instances of willful and knowing violations and I think there would be relatively few questions that an uninformed landowner who destroyed a wetland unintentionally would be subject to the full weight of those kinds of penalties.

Having said that, I think that the agencies together do need to do a more effective job of making the public generally aware of the importance of wetlands and the need to determine whether they are present when undertaking the kinds of development activities that can impinge on those wetlands and that is an important element of the administration's plan, the emphasis on working more effectively with State and local governments.

I guess as a former local planning commissioner myself, I can tell you that rarely did we take the additional step of informing developers and others of potential Federal requirements and approvals that were needed in addition to those that we levied at the local level. To the extent that we can recognize appropriate local decision making which does adequately protect these resources, I think we can eliminate a great deal of that confusion and duplication.

Senator KEMPTHORNE. My time has expired. I appreciate that final comment and certainly would encourage to the greatest extent local decision-making ability.

Thank you, Mr. Chairman.

Senator LIEBERMAN. Thank you, Senator Kempthorne.

Senator FAIRCLOTH.

Senator FAIRCLOTH. Thank you, Mr. Chairman.

Since there is confusion as to different responsibilities of the levels of government and we have an array of people here that represent the various functions of government with regard to wetlands, and there are many of us that find the wetlands responsibility of each of your agencies confusing, starting with Mr. Hall, could you explain to me your current wetland responsibilities and how they differ from Dr. Dickey and the Corps of Engineers and on down through the panel?

Mr. HALL. Yes, Senator. I'd be glad to.

The National Oceanic and Atmospheric Administration and its subagency, the National Marine Fisheries Services, has responsibility for providing biological information about the impacts of wetlands loss on commercial fisheries. As I'm sure you're aware, in the south Atlantic area in your home State, we've lost about 42 percent of the commercial fishery landings and shellfish landings since 1982. There are a number of reasons for that but one of the primary reasons is habitat loss and particularly wetlands loss. Coastal wetlands are now disappearing at the rate of about 20,000 acres a year. So our responsibility is a trustee responsibility for those marine resources and protecting the Nation's fisheries.

We operate under a Memorandum of Agreement with the Corps of Engineers and EPA in which we provide that expertise and that advice in consultation with the Corps of Engineers enforcing the law.

Senator FAIRCLOTH. In other words, you would deal primarily with the brackish water?

Mr. HALL. Yes, all the estuaries.

Senator FAIRCLOTH. Dr. Dickey?

Mr. DICKEY. The Corps of Engineers essentially administers, if you will, the Permit Program. It receives permit applications, it acts on them after receiving advice from the resource agencies. It receives and acts on individual permit requests after consultation with its sister agencies and with the public under an elaborate framework that's been established there.

The Corps also issues what are called general permits which allow various classes of activities to proceed without the benefit of an individual permit. In fact, the vast majority of activities permitted under the 404 Program are under general as opposed to specific programs, about 90 percent actually.

So the Corps is essentially the administrator, the agency to whom an applicant comes for guidance with regard to individual permit-related issues.

Mr. LYONS. Senator, the Soil Conservation Service and the Department of Agriculture functions under the authority of the Food Security Act and the 1990 Farm Bill to implement the Swampbuster Program. In so doing, the agency responsible for making determinations and enforcing provisions of Swampbuster which basically allow no draining of wetlands which were not drained prior to 1985 so as to maintain their integrity.

That authority was modified by the 1990 Farm bill to provide some exemptions for minimal effects and for some modifications in the manner in which the overall determination process would work, but largely, our responsibility is to work with agricultural producers to provide for enforcement of Swampbuster.

Mr. WAYLAND. Senator, as the primary administrators of most provisions of the Clean Water Act, we look not only to section 404 for our responsibilities to protect wetlands but other provisions of the Clean Water Act as well. To concentrate, for a moment, on Section 404, the statute does vest in Army the responsibility to be the permit issuance and processing agency subject to guidelines issued by EPA in the form of regulations and called for by Section

404(b)(1). This is the overall environmental framework under which the permitting program operates.

In addition, the agency determines the extent of geographic jurisdiction of the program, determines the applicability of the 404(f) exemption for normal agricultural and silvicultural activities, and makes decisions on whether the program should be delegated through a process known here as assumption to interested and qualified States.

We, in addition, have authority to elevate for consideration within the Department of Army chain of command permits which we believe present important national issues and we can disapprove an Army-issued permit if we determine that it is inconsistent with the 404(b)(1) guidelines, an authority which very rarely has been exercised by the agency.

Mr. BARRY. Senator, the Department of the Interior and the U.S. Fish and Wildlife Service in some respects almost has the broadest portfolio for dealing with wetlands conservation of all the agencies. We have extensive nonregulatory functions as well as regulatory functions.

For almost 60 years now, the Department of the Interior under the Fish and Wildlife Coordination Act has been put in a consultative role with the Corps of Engineers to provide comments on the biological impacts of proposed activities which could affect the waters of the United States. So the Fish and Wildlife Service is involved in a consultative role in reviewing all proposed 404 permits, for instance. This is based on an old statute that came out of the 1930's, the Fish and Wildlife Conservation Act.

The Fish and Wildlife Service also has consultative responsibilities under various provisions of the farm bill and works very closely with the Soil Conservation Service in implementation of parts of the farm bill program.

In the nonregulatory programs, the Fish and Wildlife Service has been involved for 75 years in conservation of migratory birds, the acquisition of wetlands under statutes like the Migratory Bird Conservation Act for refuges, the expansion of the refuge system. The Fish and Wildlife Service has an extensive wetland restoration program under the Partners in Wildlife Conservation Program to assist farmers and other private citizens in the restoration of wetlands. We also have had an extensive wetlands mapping program going on for many, many years.

In both the nonregulatory sense and the regulatory sense, the Fish and Wildlife Service has been providing consultation and advice to the Corps of Engineers and EPA or working cooperatively with the Soil Conservation Service and has had an extensive role in wetlands conservation.

Senator FAIRCLOTH. Thank you.

Senator LIEBERMAN. Do you want to take a few minutes to continue that line of questioning.

Senator FAIRCLOTH. Yes, I would if I may.

Senator LIEBERMAN. Yes, go ahead.

Senator FAIRCLOTH. Mr. Hall, how much did you say we were losing in wetlands?

Mr. HALL. This is just coastal wetlands, about 20,000 acres a year.

Senator FAIRCLOTH. Could you have someone in your office prepare me a map going back say about 5 years delineating what we've lost and where we lost it and the number of acres?

Mr. HALL. We'd be glad to do that. The primary State is Louisiana.

Senator FAIRCLOTH. From about 5 years back. I'd like to see because I know that we are, I just would like to be able to say where we are losing it and why.

I have a question for Mr. Lyons if I may. This penalty that Senator Durenberger mentioned, it is extremely harsh and would amount to literally a taking of the property. For the average farmer, some \$25,000 a day, it wouldn't take very long to eat up a lot of farmland and a lot of timber land at that. Would you be supportive of a great reduction of that to say the value of the land or something of that nature?

Mr. LYONS. Senator, let me point out a couple of things. First of all, we also are engaged in the practice of monitoring wetlands and trends in wetland loss. The Swampbuster provisions that you allude to, I think, have had a great deal of important effect in curbing wetland loss. From 1983 to 1987, we estimate that wetlands on private agricultural lands were lost at about 120,000 acres a year. That has been curbed somewhat; down to about 41,000 acres per year. I think that is a demonstration of the value of the program.

We tackled the issue of the harshness, as you put it, of the provisions of Swampbuster in 1990 in amendments to the conservation title of the farm bill. Of course there was extensive debate in both the House and Senate about this. We adopted a provision that allowed for a minimal effects determination. That was, if an individual inadvertently converted a wetland to cropland, and it was determined looking at the entire watershed that the effect of the loss of that wetland was minimal on the integrity of wetland resources in that area, then the farmer could, through mitigation, retain the farm program benefits that he or she enjoys. So it is an issue that we have tackled in the past. I think that is an appropriate way of trying to address that, recognizing the fact that in some cases the wetland loss may not be as significant as in others.

Senator FAIRCLOTH. But you would not support a reduction in the penalty?

Mr. LYONS. Not at this time, no, sir.

Senator FAIRCLOTH. Mr. Wayland, I notice that EPA granted to a wetland watch group \$50,000 as unofficial monitors of private wetlands. These wetland watchers would snoop landowners and see if they could find or report a violation. Are you aware of that?

Mr. WAYLAND. Senator, citizen monitoring of wetland quality is actually a very valuable component of our broader Clean Water Act efforts and literally tens of thousands of citizens annually participate in efforts to try to characterize the health of our aquatic resources, particularly streams and lakes. Those efforts have been assisted through grants.

I am not aware of the particular grant that you've mentioned. We make on the order of \$10 million in grants primarily to State a year. Some of these also are also to local and not-for-profit groups. I'd be glad to try to do some further research on that for you.

Senator FAIRCLOTH. Would you get me a list of any grants you have made to other than States, to any private groups to monitor?

Mr. WAYLAND. Yes, I will.

Senator FAIRCLOTH. That gets into, in my opinion, government snooping. That becomes an intrusion upon the privacy of the public.

I don't have any further questions right now.

Senator LIEBERMAN. Thank you, Senator Faircloth.

Mr. Lyons, let me come back to some of the questions asked about the role of the Soil Conservation Service. As indicated in my opening statement, I think the recommended change to have the Soil Conservation Service be the agency which makes wetland permit decisions for agricultural lands is a sensible and necessary one, but as you know, there are critics of the proposal and I want to give you an opportunity to respond to those.

Let me just paraphrase some of the criticisms. The critics argue that the unspoken mandate of the Soil Conservation Service has been to help create more cropland, that it has a poor record in the Swampbuster Program and its field staff lacks the scientific expertise, experience or knowledge to deal effectively with the identification of wetlands. More generally, I suppose, building from all this, the strongest critics basically argue that because of the tremendous loss of wetlands due to agricultural practices that this proposal essentially puts the fox in with the hens. Why don't you respond to that series of questions?

Mr. LYONS. Well, I find myself in an interesting position, Senator, because just a year ago I was with the staff of the House Agriculture Committee and might have joined with some of those critics, but now I'm on the other side of the fence.

Senator LIEBERMAN. So you think you've grown older and wiser?

Mr. LYONS. Yes, much wiser in the last 3 months.

I would say this in all seriousness in response, it's interesting if you talk to agricultural groups about SCS. They see them as the green police and they are quite exercised about the belief that they think SCS performs too much of a regulatory function and in effect, is too aggressive in its implementation of the conservation provisions of the farm bill.

I think there is a balance there but more importantly, we have a good working relationship with the Fish and Wildlife Service and the Conservation Title of the 1990 Farm Bill strengthened that relationship and brought the Fish and Wildlife Service into close involvement in our activities related to wetlands on the ground.

In addition, we have made extensive efforts in recent years to beef up the biological expertise and capability of SCS and I think that has added to our capability on the ground to make things work better.

Finally, I'd point out that I think this proposal to bring the agencies together, to work cooperatively to come up with a common definition, a common manual for implementation, a common agreement on what constitutes a wetland helps to address the criticisms of those who say if you leave SCS out there on their own, then you do in fact leave the fox guarding the hen house because we are not going to be out there on our own. We are simply going to be the contact point for implementing a comprehensive and cohesive Fed-

eral policy which reflects an agreement on what wetlands should look like and how they should be protected. I frankly assume then that the Corps and EPA, and others, will be making the same assumptions and viewing wetlands in much the same way.

So I think this is a very, very different approach and frankly, I think that SCS is quite up to the task. In fact, I would point out that SCS over the past two decades has led the way in promoting watershed-based planning in a number of ways and as a part of our effort to lead by example, the two agencies that I work with—the Forest Service and the Fish and Wildlife Service—are moving aggressively to ecosystem management and watershed-based planning for all their activities.

I think to the contrary we can stand up to our critics and demonstrate that we have the capability and expertise and by working with our partners here at the table have the capability to do the job to protect the Nation's wetlands.

Senator LIEBERMAN. How is the relationship working under the farm bill and is it a model for what can happen here?

Mr. BARRY. I was the Department of the Interior's representative on the administration's Wetlands Task Force and when the question came up regarding the role of the Soil Conservation Service in the 404 Program, quite frankly, I turned to the Fish and Wildlife Service and expected to hear loud complaints from them. I was surprised by the response that I got from the Fish and Wildlife Service. The people in Washington told me that they have an excellent working relationship with the Soil Conservation Service, that they really have very few complaints in what they see as a changed commitment within the Soil Conservation Service toward wetlands conservation. Quite frankly, the people in the Service that I dealt with on the Task Force were very supportive of the shift to the Soil Conservation Service and the lead for the 404 Program.

As Jim mentioned, a close working relationship has evolved since the passage of the farm bill. I think the Soil Conservation Service and the Fish and Wildlife Service has established at the field level, which is really the important place, a number of cooperative links. There are a number of consultative roles that the Fish and Wildlife Service plays under the farm bill in aiding and assisting the Soil Conservation Service. The net result of all of that has been that when I turned to them and said, what do you think, can you really trust the fox in the chicken coop, the answer from the Fish and Wildlife Service folks was, you bet.

Senator LIEBERMAN. Good.

Let me ask you a question, before my time runs out, which is on a different subject and that is that the administration proposal mentions wetlands creation several times in the report as a potential option for mitigating wetlands loss. I can't recall any strong scientific testimony that it is possible to create, as opposed to the mitigation banking we were talking about earlier, a wetland. What would be your response to that? Is it possible?

Mr. BARRY. I think between the two options you may have for producing mitigation, wetland restoration or wetland creation, clearly it is much easier to try and restore a wetland than to go out and create a brand new wetland. I think wetlands creation science is still evolving and there is a lot more that needs to be done.

The Fish and Wildlife Service has an extensive wetlands restoration program underway. For instance, it's very easy to restore a lot of farmed agricultural lands, go back in, break a drain tiles and so on. Wetlands creation is much more difficult. You need to have a much more thoughtful approach to it and I think the jury is still out as to how successful it ultimately will be. It certainly is an area in which we are interested in pursuing additional research.

I think also it needs to be kept in the broader context or at least we need to keep a broader context and that is that the most effective way for preserving and conserving wetlands is to protect what we have. It's only really after a decision has been made that we can no longer avoid in a particular area or we can no longer avoid the destruction of wetlands that we then start to talk about things like wetlands restoration and creation. Under those circumstances, I think wetlands restoration is a safer, better way to go. You have a much greater likelihood of success.

Senator LIEBERMAN. So at this point, wetlands creation is an idea to explore but if I hear you correctly, we're not certain it is feasible yet?

Mr. BARRY. Well, again, it's an evolving science and I don't think we're ready to declare victory yet. It's much easier to restore a wetland that did exist in nature before and that acts of civilization have sort of altered it. You go back and you can reconstruct things frequently. In a lot of these former wetland areas, you still have seeds in the ground. You go back, restore the hydrology and all of a sudden you have wetland vegetation popping by up after a number of years.

Senator LIEBERMAN. My time is up.

Senator Faircloth, do you have any other questions?

Senator FAIRCLOTH. Yes.

Mr. Lyons, just recently a blueberry farmer in North Carolina came to me and told me he wasn't permitted to grow blueberries on his land because they were not a commodity. Therefore, they were not subject to the Swampbuster and normal agricultural exemption under 404. Why should he need a permit at all?

Mr. LYONS. Senator Faircloth, I know that blueberries are not a commodity as defined in the context of the Farm Program. I'm not sure I can address the question of the normal agricultural exemption as well as perhaps Bob Wayland might since he administers that element of the program. Maybe I should turn to Bob.

Mr. WAYLAND. I'd certainly like to have more information, Senator, and be able to follow up on this, but the Clean Water Act exemption is for normal, ongoing agricultural operations and if the intention was to take existing wetlands, waters of the United States, and convert them for purposes of growing blueberries, that would be an activity—the draining or drilling associated with that activity would require a permit. The fact that a permit might be required is not to say that the permit wouldn't be granted.

As you are probably familiar, there are about 80,000 activities a year that are authorized to take place in wetlands under the Clean Water Act, many of them under general permits. It is entirely possible, depending upon the size of the operation here, a general permit would have been possible.

If you can provide some additional particulars, we'd be glad to look further into the specifics.

Senator FAIRCLOTH. Mr. Lyons, the administration's position does not consider haying, cutting hay, and grazing, a normal farming or ranching activity. If cutting hay and grazing cattle is not a normal ranching activity, and it is abnormal, would you give me a normal one?

Mr. LYONS. I can give you a lot of normal activities, but again, I hate to do this but this issue again gets to the heart of EPA's jurisdiction and implementation of 404 with regard to the normal practices exemption, so I'll have to ask Bob to address that, if I could.

Senator FAIRCLOTH. Would you tell me if cutting hay and grazing cattle is not a normal ranching activity, what is it?

Mr. WAYLAND. Senator, if those activities are ongoing agricultural practices, they are certainly permissible under the section 404 Program. The intention in the agreement that the four agencies have recently reached on determinations of 404 jurisdiction on agricultural lands is keyed to the Swampbuster definition. Swampbuster, of course, applies its sanctions based on program or commodity crops—corn, wheat, soybeans, et cetera.

The applicability from a section 404 standpoint comes from our desire to try to reconcile the two programs. The regulation which was recently adopted as part of the President's plan exempts the same set of activities from the 404 Program as are defined "prior converted crop lands" under the Swampbuster Program. Certainly S. 1304 includes in its definition of areas which would be exempted from Section 404, haying among others.

Mr. LYONS. Senator, I believe there are exemptions for those practices, both under Swampbuster and 404. So again, if you have a specific case you would like us to address or investigate, we will certainly do that.

Senator FAIRCLOTH. Would you expect a sophisticated farmer to understand the intricate details of 404?

Mr. LYONS. Well, Senator, I would point out that this is one of the reasons that we're working together as an interagency team to try and come up with some ways to simplify the processes and to clarify for producers precisely who they need to deal with on the ground. Certainly, an additional part of this will be more information provided to producers so that they know when they deal with SCS, and that is who they are going to have to deal with on the ground, the information they need to obtain, and what practices they can and cannot engage in. That's why we're trying to change the policy, to move in a different direction and make life easier.

Senator FAIRCLOTH. That would be nice.

You would not even hint that there might be an over regulation of the activities on private land?

Mr. LYONS. I would suggest strongly there is always need for improvement in how we implement these programs. We seek to move aggressively to do that.

Senator FAIRCLOTH. How long have you been with the Department of Agriculture?

Mr. LYONS. Since May 12th.

Senator FAIRCLOTH. That doesn't give you much of a background, does it?

Mr. LYONS. I know a little bit about agriculture, Senator.

Senator FAIRCLOTH. When did the Soil Conservation Service do a 180 degree turn to the preserving of wetlands to the drainage of wetlands?

Mr. LYONS. Well, Senator, the statutory change in authority for the Soil Conservation Service occurred with the 1985 Farm Bill.

Senator FAIRCLOTH. Prior to that, they drained farmland.

Mr. LYONS. I would say prior to that, the Soil Conservation Service provided technical assistance for a whole host of activities and programs and I would say that in 1985, a significant change in policy did, in fact, occur.

Senator FAIRCLOTH. When you say technical assistance, what does technical assistance mean?

Mr. LYONS. Going out in the field and showing you how to put in drains or how to tile a field or to do whatever was necessary.

Senator FAIRCLOTH. You paid the money too.

Mr. LYONS. No, SCS doesn't provide cost-share assistance.

Senator FAIRCLOTH. Whoa. I ran 10 to 12 drag lines for 15 lines digging ditches and was paid by the ASCS.

Mr. LYONS. That's the ASCS.

Senator FAIRCLOTH. No, SCS supervised it and ASCS gave the money; it came through the same check.

Mr. LYONS. I don't mean to be technical, but that's true.

Senator FAIRCLOTH. When did ASCS stop that? When did they do the 180-degree turn?

Mr. LYONS. They still write checks.

Senator FAIRCLOTH. For drainage?

Mr. LYONS. No, sir.

Senator FAIRCLOTH. When did they stop?

Mr. LYONS. In 1985, I would say with the change in statutory direction that was provided.

Senator FAIRCLOTH. You've got some new information?

Mr. LYONS. No, sir, just a point of clarification. There was also an Executive Order in 1987 that clarified that we would not fund activities that would lead to the drainage of wetlands. So that reaffirmed the statutory change in direction that was provided in 1985.

Senator FAIRCLOTH. We talk about restoring wetlands, which is certainly an admirable direction, but the major loss of wetlands came about through the Corps of Engineers and the ASCS. The Corps of Engineers drained the majority of the Nation.

Mr. DICKEY. There is no question that the Federal programs encouraged historically the drainage of wetlands, certainly.

Senator FAIRCLOTH. Well, the Corps of Engineers is spending vast amounts of money to operate the drainage system in the Everglades.

Mr. DICKEY. To be sure.

Senator FAIRCLOTH. Millions and millions of dollars. Any plans to convert that or stop it?

Mr. DICKEY. As you know, we have authorized a major restoration project of the Kissimmee River which will undo the drainage, if you will, that occurred there.

Senator FAIRCLOTH. Well, it wasn't drainage, you just converted the Kissimmee River to channel 38, I believe was your designation of it.

Mr. DICKEY. That's right, and again, those reflect values of the past which are no longer the values of today.

Senator FAIRCLOTH. How about switching the pumps off?

Mr. DICKEY. Unfortunately, just turning off the pumps in and of itself doesn't restore the natural system.

Senator FAIRCLOTH. It would go a long way toward it, wouldn't it?

Mr. DICKEY. To some extent it may, but it also might have other untoward impacts on private property and so we proceed to do these things in the context of an authorized project with appropriate compensation to those who lose the benefits. After all, these things were done for some economic gain and people look for compensation when that service is removed.

Senator FAIRCLOTH. Mr. Dickey, Bernard Goode, do you know who he is?

Mr. DICKEY. Yes, I do, Bernie Goode? Yes.

Senator FAIRCLOTH. He said, "Even when I was in government, the wetlands program seemed wrong. I've now come to realize just how unfair, outrageous, and abusive to landowners it really is." That is a former colleague. Would you like to comment on his statement? Do you respect his honesty, integrity, or do you not respect it, or do you agree with him?

Mr. DICKEY. I certainly respect his right to have his views and I guess it is good that he has retired.

[Laughter.]

Mr. Faircloth. I'm sorry, I didn't hear you.

Mr. DICKEY. I said I certainly respect his right to express his views and I understand why he would be retired with views like that.

Senator FAIRCLOTH. You mean you fired somebody?

Mr. DICKEY. No. I said he retired and I said it's good because certainly those are not our views.

Senator LIEBERMAN. Senator Faircloth, if I might, I think we have to move on if you want to finish this line of questioning but we've got to move to the next panel.

Senator FAIRCLOTH. Thank you.

Senator LIEBERMAN. We do have to go on to the next panel. I had another question about the terms under which the administration's program calls for partial assumption of responsibility of the wetlands program under 404. Right now, as you know, Michigan is the only State to assume any responsibility. There is a lot of concern at the State level about the cost of the program and the difficulty.

I just say that by way of noting it and I would like to submit that question to you in writing and ask you to just define or explain a little bit more what you have in mind by partial assumption by the State? Mr. Wayland, do you want to try this quickly?

Mr. WAYLAND. I could do that very quickly. I think a number of States have expressed a willingness to operate a program that would address certain kinds of activities or certain kinds of wetlands. There is one mechanism, the programmatic general permit, through which that could be realized. If their intention is to progress toward full implementation of a program equivalent to the Federal program, another intermediate step would be to au-

thorize them to regulate certain activities or only certain classes of wetlands. That's what we mean by partial assumption.

Senator LIEBERMAN. So EPA would continue to exercise oversight and set some standards essentially for the delegation?

Mr. WAYLAND. Yes, absolutely.

Senator LIEBERMAN. Thank you all very much. It has been a very helpful panel and we look forward to working with you as we proceed with this reauthorization.

Senator GRAHAM. [presiding] Thank you very much, Senator. It looks as if I arrived at the end of act one and we are now ready for act two.

Thank you very much, gentlemen.

Our next panel consists of Dr. Joe Larson, Professor of Biology, The Environmental Institute, University of Massachusetts at Amherst and Dr. David Cooper, Senior Research Scientist, Department of Fishery and Wildlife Biology, Colorado State University. Dr. Larson and Dr. Cooper, please come forward.

Dr. Larson and Dr. Cooper, we very much appreciate your joining us today and we look forward to your testimony which will underscore some of the special distinctions between this issue in the eastern and western portions of our country.

First, Dr. Larson.

**STATEMENT OF JOSEPH S. LARSON, PROFESSOR OF BIOLOGY,
THE ENVIRONMENTAL INSTITUTE, UNIVERSITY OF MASSACHU-
SETTS AT AMHERST**

Mr. LARSON. Thank you, Mr. Chairman, for the opportunity to provide some scientific background on functions and values of wetlands in the eastern United States.

I'd like to open my remarks by recalling that wetland regulation and the permit process in obtaining permits for wetlands actually started 14 years before the Federal Government became involved in the 404 Program and started in my State of Massachusetts. I hasten to recognize that also the States of Connecticut and Rhode Island came in quickly after that.

The initiative for wetland regulation did not come from government bureaucrats in the various State houses but came from local towns that wanted to protect the functions of coastal marshes as nursery grounds for commercially valuable fish and shellfish and then from inland communities who recognized that wetlands were critical to reducing downstream flood damage.

Today, many of the eastern States have their own inland wetland regulatory programs; all of them have some form of coastal regulatory program; and some States have local or municipal regulatory programs. This is an area in the country where we have a lot of wetlands and we have a lot of people. It's interesting to note that the initiative came originally from the people and not from the State bureaucracy.

The eastern United States is characterized by abundant rainfall, evenly distributed across the year, and as a result, we have a great number of wetlands. The Atlantic and Gulf Coasts of the east are geologically older than the Pacific Coast and have well-developed and large coastal wetlands often behind barrier beaches and bar-

rier island chains. Large river systems and their sediments have formed major estuarine and coastal wetlands systems.

The glaciated northern part of the eastern United States is characterized by wetlands that range in size from less than one acre to many hundreds of acres. They are abundant and scattered across the landscape. In the unglaciated portion of the east, central Atlantic and southeastern States, wetlands are primarily associated with small to large river systems and artificial reservoirs.

I'd like to touch briefly on the major functions and values first, of eastern coastal wetlands. Marine fisheries are an important product of coastal wetlands in the eastern United States. It has already been noted before by one of the committee members the extent to which commercial shellfish and finfish harvested in the entire United States depend on coastal wetlands as nursery areas and as a food source.

The importance of this function is high both on a local and a regional scale. For example, in 1980, the economic value of Chesapeake Bay seafood, sport fishing and related activities was valued at about \$756 million. The same region, Chesapeake Bay produces annually 90 percent of the stripped bass harvest along the entire Atlantic Coast and that species is a species that is closely tied to the Chesapeake Bay wetlands.

In Louisiana, the multimillion dollar commercial fish in-shore shrimp industry is directly proportional to the area of intertidal wetland and losses of these wetlands are having a major effect on the fishing industry. The National Marine Fisheries Service estimated for the period of 1954 to 1978 annual fishery losses due to estuarine marsh losses at \$208 million.

Coastal wetlands do have a role to play in certain circumstances in storm damage. When coastal storms move onshore at low tide, coastal wetlands can provide a measure of storm buffering, but more importantly, and fully demonstrated by recent east coast hurricanes, coastal wetlands are areas of high risk for human habitation and development. Maintaining these wetlands in their natural state by prohibiting development is an avoidance of major individual and public financial losses.

Some comments on the functions and values of eastern fresh water wetlands. Wetlands on the streams of the eastern and southeastern United States provide natural flood storage that reduces the height of flood crests at substantial savings to downstream landowners, cities and towns. Especially important in this regard are the large wetlands positioned in the midstream on the main stem of major watersheds.

A classic example of this kind of wetland performance and flood control comes from my home State, the Charles River in Massachusetts. The Corps of Engineers did a study of the effectiveness of those wetlands in reducing flood damage as opposed to creating artificial structures and found it was more cost effective to preserve 8,000 acres of wetlands to provide prevention of flood damage valuing \$17 million a year downstream in the Boston area.

In Wisconsin, floods may be lowered as much as 80 percent in watersheds that have many wetlands as compared to those that have few wetlands. The same can be said in general about the bottomland hardwood forests of the Mississippi River. Originally,

those bottomland hardwood forests had the capacity to store flood-water equivalent to about 60 days of river discharge prior to human settlement. Human settlement and development and construction of levees along the lower Mississippi River has reduced that flood storage from 60 days of discharge to 12 days. This is one of the main reasons for flood damage in the lower Mississippi River.

Another important function of the inland wetlands is water quality maintenance. Inland wetlands act to capture sediment and remove nutrients that if not trapped or removed would degrade downstream water quality. We are particularly concerned here about the effects of nitrogen and the effects of phosphorous. An example of this role comes out of the Delmarva Peninsula occupied by Delaware, Maryland and Virginia where forested wetlands play an important role in reducing concentrations of nitrate in groundwater and surface water. The economic significance of wetlands in Chesapeake Bay in terms of water quality can be looked at in terms of what would happen if the wetlands of the streams moving into Chesapeake Bay were filled. It would cost \$926 million to upgrade the sewage treatment plants in Maryland and Virginia to compensate for the lack of sewage treatment capacity of those wetlands on the streams going into the Chesapeake Bay.

Some wetlands are intimately involved with groundwater recharge and discharge and in some parts of the country, important municipal well systems draw on wells drilled in wetlands or close to wetlands.

With regard to forestry and fish, the bottomland hardwoods of the southeastern United States are important as productive forest sites and during the flooding season are critical for the maintenance of many fish populations in these bottomland hardwood streams.

I see that my time has come to an end. I would like to conclude my summary of written testimony to say something about assessment of functions and values.

You will note in the proposals from the White House and also I think recognized in the background material of the bill produced by Senators from this committee, that the notion of a priori categorization of wetlands into high, low and medium value has been rejected by the administration and appears similarly to be rejected by the legislative proposals from this committee.

I concur in that rejection but I would also point out that we ought not to be rejecting the notion that we can identify wetlands that have particularly valuable roles and particular functions. We are already doing this by identifying wetlands under the RAMSAR Convention on Wetlands of International Importance, we already do this by acquisition of wildlife refuges.

If the administration and legislation coming out of this committee proposes that we use as an analog the information about a resource such as is encompassed in the soil maps and texts that have long been used by the Soil Conservation Service to help guide us on the limitations and hazards of usages of certain soils, if that kind of investment and categorization is being sought, that certainly I think would be supported by elements of the science community.

I thank you very much.

Senator GRAHAM. Thank you, Dr. Larson.
Dr. Cooper?

STATEMENT OF DAVID J. COOPER, SENIOR RESEARCH SCIENTIST, DEPARTMENT OF FISHERY AND WILDLIFE BIOLOGY, COLORADO STATE UNIVERSITY

Mr. COOPER. Thank you, Mr. Chairman. I appreciate the opportunity to come before you today.

The perception that the west is dry really permeates most people's thinking in the United States, and for this reason, most people have come to the conclusion that there are no wetlands in the west. This was accentuated when the National Wetland Inventory first started mapping wetlands in the west. When they started mapping wetlands in the United States, they chose some large areas in the west to map and they quickly got bogged down in the fact that there were lots of wetlands in the western United States and fundamentally they were very different from those in the eastern United States.

The west is dry. Most areas between Kansas and the Sierras in California receive less than 15 inches of precipitation. When precipitation does occur in the form of snow or water, it is seasonal. Most of the wetlands in the western United States do go dry periodically. However, the water does run off the landscape and we find that the wetlands are very important for treating water before it runs into streams and into groundwater and lake systems as well.

Because wetlands are so scarce, most States in the west have less than 1 percent of their area as wetlands. The State of Nevada has three-tenths of 1 percent. Because wetlands are so uncommon, their value and their function is accentuated even more. They are vital to wildlife; they are vital to treating runoff from partially vegetated lands and agricultural lands which are abundant throughout the west; they are important for retaining floodwaters because many times when water occurs seasonally, it occurs all at once and that provides some big problems with flood control as well.

Information about the functions of western wetlands is fairly recent in coming and to illustrate some of my points, what I'd like to do is show you a series of slides about what western wetlands look like and some of their functions and I'll summarize quickly after that. [Slide]

This is a photograph of the northern prairies of North America. What you can see here are a series of basin wetlands that we call the prairie potholes. These are formed by glaciation. They are all internally draining; there aren't streams; they are all basically isolated. [Slide]

There is another view. These are wetlands in North Dakota. They are isolated. Each one basically receives its surface water from runoff in that area. They can be connected via groundwater, however.

These don't just occur in the northern prairies but they occur in large complexes from the Gulf Coast all the way up into Canada to

the Arctic. They are called a variety of different names—playas, vernal pools, prairie potholes, et cetera.

Senator GRAHAM. Excuse me. On that last slide, could you give us an indication of the scale? For instance, the water bodies in the lower left, how many acres?

Mr. COOPER. That would be probably about 10 acres. Most of them are small.

Senator GRAHAM. Do they tend to occur in clusters such as this?

Mr. COOPER. Yes, they do. They are in large clusters. Some of them are very significant but they are scattered throughout the area—the rainwater basin in Nebraska, the playas of North Texas. They are big complexes but they are formed by different processes in each region. [Slide]

This is a closer view of one of these. You can see that most of these potholes are completely surrounded by agricultural land, the ones that are undrained at least. They are marsh complexes that are vital to waterfowl. [Slide]

This is a little closer view and you can see that they occur in between hills. These are basins that can hold a large volume of water. The value of one wetland in particular is not valuable but cumulatively, thousands and thousands of these basins provide phenomenal functioning for water retention, sediment retention, nutrient transformations, et cetera. [Slide]

The waterfowl value is very well known. Fully 60 percent of all the waterfowl in North America use these basin systems in the prairies and that is a tremendous percentage considering their small area of the United States. These kinds of basins don't just occur in the northern prairies but they are scattered throughout the arid west. This is an intermountain basin in Colorado, they occur around Great Salt Lake and many other areas throughout Nevada. Senator Reid this morning suggested that the Stillwater Marsh was a similar system and indeed, it once was. [Slide]

Some of these are dry seasonally and you have to wonder how something that can dry up seasonally can be so valuable. The point is that by drying down, they then enhance the amount of water that they can hold when larger amounts of water come. In addition, when the area dries, the vegetation created by algae and vascular plants decomposes and the nutrients are then available for the next wet cycle which are put into solution and create phenomenal productivity rivaling some of the salt marshes of the United States that are very important for waterfowl.

The second major kind of wetland in the west are what we call riparian wetlands, occurring along streams. The stream is a different system but the flood plain dominated by plants here is the riparian wetland. Some of the functions I'll just go through very briefly. [Slide]

One of them, as you can see here, is the input of organic matter into the adjacent stream system. The fish that live in these streams, particularly trout and others, feed largely on invertebrates, insects, and the insects are living on organic matter imported from the adjacent riparian wetland. So the riparian system is feeding the insects that the trout feed on and it supports the entire aquatic food chain.

Large wood like this shades the stream, provides litter input as well, particularly in the northwestern U.S. and other areas. The trees are important, not just when they are alive, but when they are dead as well. When they are dead, they fall in to the stream, get lodged together and create the actual pools and riffles that we find in many western wetlands. So these inputs of large dead wood is essential as well. [Slide]

Many of these systems can store water. This is a little lower in the basin. You can see a large meandering stream here in the foothills of the Rocky Mountains. These areas can store lots of water in the floodplain soils that can be released later on in the summer when the streams are at much lower base flow. That enhances stream flow, fishery support and the use of this water downstream by agriculturists and municipalities.

I can't stress enough the importance of maintaining the integrity of these systems, both the flood flows and the vegetation. In the past, the vegetation has been removed from a lot of these systems. Here you can see on the left bank a big stand of willows holding the stream side stable. When the vegetation is removed, the whole system collapses. There is no more input of nutrients in the form of organic matter, the stream food-chain collapses, the water quality is degraded by the input of sediment, et cetera. This is really the general case throughout the west. Many of these systems have been degraded by vegetation removal which is really dramatic. [Slide]

Many of the larger rivers fed by snowmelt flood as well or used to flood. The Bureau of Reclamation has come to the rescue of many people who were interested in settling flood plains. The importance of flooding is twofold. One is that many of the native fish in these systems would move out of the channel and into these adjacent wetlands that you can see here. This is along the Green River in Utah and in those adjacent wetlands they would find cover and food and move back into the stream in low flows. [Slide]

The diking-off of streams and the regulation of streams so that there is no more flooding have really limited the distribution of endemic fish in the western United States and the function then is lost. [Slide]

This is a picture of the Missouri River in Montana. You can see the extent of the former flood plain by the edges of the banks way back. Now the flood plain is basically the stream and it doesn't even extend as far as the cottonwood trees which are dominating this flood plain. Those cottonwood are a relic of a former flood regime. [Slide]

The cottonwoods, these plants here are really indicative of the health of the system. They are short-lived plants and they are essential for supporting birds and other animals. [Slide]

Another major kind of wetland in the west are areas that have high water tables. These are called wet meadows and many of these, as you can see in this photograph, are created by agriculture, many of them are natural, and these provide tremendous support for agriculture in the west, particularly grazing. On the right side of this photograph you can see an area that is irrigated and has been supported by water taken out of the stream.

To summarize, since my time is coming up here, the west has wetlands which are of international and certainly interstate importance. Waterfowl are using wetlands on a global scale or at least on a continental scale in this part of the world. They are moving from the Gulf Coast up through the continent's wetlands. Water is also flowing from State to State to State in floods and the water quality changes occurring one State certainly affect all the others. So there is a definite role for the Federal Government in this situation.

We know a lot about the percentage of waterfowl that use these wetlands; we know quite a bit about some of the fisheries issues and their support by wetlands and we really know very little about some of the other functions. Wetland science is just developing in the west and there are problems in really trying to value economically some of these wetlands.

Thank you.

Senator GRAHAM. Thank you, Mr. Cooper.

As indicated earlier, panel three, Congressman Don Edwards and Senator Barbara Boxer when they arrive, will interrupt the completion of panel two. I understand that Congressman Edwards is now here. Is that correct? Yes. Congressman Edwards, if you would please come forward, we would like to hear from you. I understand that Senator Boxer is on the way and perhaps by the time you've completed your statement, she will be here.

STATEMENT OF HON. DON EDWARDS, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mr. EDWARDS. Thank you very much, Mr. Chairman and Senator Lieberman. I am really pleased to be here and thank you very much for inviting me.

I will make a few short remarks about the Edwards-Boxer bill. We have 83 cosponsors in the House of Representatives. We had about the same number last year. It has been very well received by all of the environmental groups and Barbara and I are very proud of the bill.

I am particularly concerned about wetlands, their value and the danger of losing more, because I come from California and have represented the south San Francisco Bay area for the last 31 years where we have lost so many thousands of acres of wetlands. In the State itself, we've lost 90 percent of our wetlands. Nationwide, as I'm sure other witnesses have testified, we're losing up to 300,000 more acres each year. Very clearly something should be done about it.

The bill that Senator Boxer and I have authored is a conservative bill in many ways. It is balanced and realistic and it tries to address some very real problems that exist in our national policy toward wetlands. The laws about wetlands are not clear, and the people dealing with wetlands are entitled to have clear laws. We need a better review process for the permits. There are some very serious problems in the present system. They lack consistency, the delays are intolerable, and the permit process needs to be faster. There is entirely too much emphasis on regulating and not enough emphasis on encouraging conservation. Our bill addresses these issues.

Briefly, Mr. Chairman, what we need is a scientifically based definition of what wetlands are. There is no definition. The National Academy of Science will give us their report on this issue by the end of 1994, I believe, and that will help so that we can use the same criteria when we're talking about wetlands.

The delays in acting on permits are intolerable, as I said, and the Edwards-Boxer bill provides for a fast track process so that there can be approvals or denials within 60 days.

Farmers need protection and they need clarification of how to comply with the law. Our bill provides that artificial wetlands and abandoned croplands need not be regulated, so farmers need not worry about their abandoned or unused agricultural lands. We don't think that they ought to be regulated. We do need incentive-based programs that encourage conservation. That is why it is important to fully fund the Wetlands Reserve Program and to give tax incentives to make conservation financially attractive. That's a lot cheaper for the Federal Government to do than to have to buy land or anything like that.

I'd like to point out a couple of more important issues. One that is really very important is mitigation banking. Mitigation is very useful but it needs a lot of care and caution. Often when wetlands are replaced, the newly created wetlands are not as good. In almost every case, they are not as good as the wetlands that we lost. I approve, and so does Senator Boxer, of that portion of the Baucus-Chafee bill that limits mitigation to restoration. Mitigation should only be met through the restoration, and not the new creation, of wetlands. Any restoration should be limited to the same watershed that the lost wetlands are in. We should ensure, which is not done now, the long-term monitoring of mitigation projects. Too often the mitigation is initiated and then nobody watches to see how well it is carried out.

We approve of adding provisions, which are not in our bill, for an administrative appeals process. But the administration proposal is one-sided in our view and only allows appeals for the denial of a permit. We think that the appeal should be open to all affected parties as long as they were involved in the process from the beginning.

It is very important, and let me say this once again, as I get ready to close, to provide for expediting permits. I already mentioned the fast track for small parcels in the Edwards-Boxer bill, but the administration's idea that you must get a decision within 90 days is pretty rigid. There ought to be some escape hatch for cases that are very complicated and should not be rushed to judgment.

In summary, Mr. Chairman, I thank the committee very much for the good work you're doing and respectfully request that you take a good look at the Edwards-Boxer approach. We believe that it does provide flexibility and that if the provisions are adhered to in this bill, we will stop the loss of wetlands which is inexorably taking place in our country to our dismay.

Thank you again for allowing me to come over here today.

Senator GRAHAM. Thank you very much, Congressman. I will assure yourself and Senator Boxer that the very significant contribution which you have made by the thoughtful development and

introduction of your legislation will certainly be a major part of our consideration of what to recommend to the Senate when we are at that point in the process.

Mr. EDWARDS. Thank you very much.

Senator GRAHAM. I'd like to ask this question which has concerned me. Earlier in his opening statement, Senator Lieberman made the observation that we've somewhat backed into our current Federal wetlands policy. If you look through the Clean Water Act, the word "wetlands" does not appear. This has been a program developed largely by regulatory rather than congressional initiative.

I'm concerned as we now face this frontally and try to ask some hard questions as to what does the Congress want in terms of policy as to where we should draw the line as between what is a federally appropriate area of responsibility and where responsibility for wetlands protection should be at some other level of government.

Does your bill suggest where that line should be or do you have any thoughts that might be of assistance to the committee?

Mr. EDWARDS. Mr. Chairman, we didn't think it was necessary. We think it's very clear that there is Federal jurisdiction. Certainly the wetlands affect all of the States. There should be a national policy and as is customary where there is a national issue, and perhaps even a constitutional issue, the Federal Government has the obligation to preempt where necessary.

Senator GRAHAM. So you believe that wetlands policy should be a Federal Government responsibility?

Mr. EDWARDS. I think in the Clean Water Act, as it is amended, the responsibility we have should be much more explicit. It should also regulate other ways of destroying wetlands such as dredging and trenching and things like that which are not included in the Clean Water Act now. It should be made much more explicit.

At the beginning of my testimony, I said that the people involved, the developers, farmers and others, deserve explicit legislation.

Senator GRAHAM. Congressman Edwards, we have now been joined by your colleague, Senator Boxer. Senator Boxer has caught her breath. We would be very pleased to hear from you at this time.

STATEMENT OF HON. BARBARA BOXER, U.S. SENATOR FROM THE STATE OF CALIFORNIA

Senator BOXER. Mr. Chairman, I thank you so much.

I've been on the floor in a little battle with the Senator from North Carolina regarding the NEA. You know when you battle with the Senator from North Carolina, it's a battle, so I appreciate the fact that you would allow me to come now and give my testimony and then run back to battle.

Thank you so much for this opportunity. As you know, I've introduced S. 1195, the Wetlands Reform Act of 1993 and I'm very honored to be testifying with my distinguished colleague, the Dean of the California delegation, and I would say the conscience of the House of Representatives, Don Edwards.

We do offer a unique perspective on this issue because our State has the unfortunate distinction of having lost a greater percentage of its original wetlands than any other State, 91 percent. We realized late in the game, the incredible economic as well as environmental value of wetlands and we want to make sure we can save our remaining 9 or 10 percent and we want to make sure that the 47 percent of historic wetlands remaining in the rest of the United States gets saved. I know you share that goal.

Alarming recent estimates indicate that the Nation loses 290,000 additional acres of wetlands each year or nearly 1 percent of its remaining total every three years. These losses continue because of loopholes in the existing law. So the bill that Congressman Edwards and I have introduced will help stem that tide of wetlands destruction by establishing a national policy preserving the quantity and quality of our Nation's wetlands.

Unfortunately, Mr. Chairman, wetlands conservation is portrayed too often as a luxury that an expanding economy cannot afford. Nothing could be further from the truth. Saving our wetlands is essential for saving our economy. Wetlands play a key role in minimizing flood damage. In the summer, we witnessed some of the worse flooding in the Nation's history. Look at the \$5 billion-plus cost of disaster relief. Some say, Mr. Chairman, it will go up to \$10 or \$11 billion to address the floods in the midwest.

I will say to you that if you look at the Fish and Wildlife Service reports, flood damage is directly attributable to wetlands losses. The Service found widespread flooding in Iowa to be directly linked to the State's loss of 89 percent of its original wetlands. In Massachusetts, the Army Corps found that preserving existing wetlands in the Charles River was more cost effective and provided better flood protection than building extensive new flood control facilities. Wetlands also play an important role in improving water quality.

As we proceed with the reauthorization of the Clean Water Act—I'm so pleased to be on the committee with you—we should be aware that wetlands can control nonpoint source pollution by removing and retaining nutrients processing chemical and organic wastes and reducing sediment loads to receiving waters. Wetlands actually act as biological filters of our water supply. In addition, wetlands provide critical habitat for a wide variety of plants and animals. The wellbeing of waterfowl and other populations is tied directly to the status of these habitats.

Fisherman also rely on wetlands for their living. Fish and shellfish need healthy and abundant estuaries for spawning and nursery grounds, migration and food production. Studies have estimated the fishery value of wetland habitats to be as high as \$14 billion annually. The loss of these habitats can have a devastating economic effect. For example, Mr. Chairman, I'm told that shrimp harvests in your State of Florida have declined by more than 75 percent since the early 1980's due largely to wetlands destruction.

Based on studies done on wetlands by the Fish and Wildlife Service, the Army Corps and other agencies, we know there has been an economic analysis prepared under the direction of the School of Public Policy at the University of California-Berkeley and the analysis assigns a range of economic values to the various wetlands functions.

Using my State of California as an example, remember we've lost more than 90 percent of our wetlands, the study shows that the total annual benefit of wetlands to the State, the remaining wetlands, ranges from a low of \$6 billion to almost \$23 billion. That's the amount the State would lose annually if 100 percent of our wetlands were lost. The study also arrived at a range of permanent values of California wetlands. Those range from a lower bound of \$78 billion to an upper bound of \$286 billion.

If you apply this method of valuation to the Nation's 104 million acres of wetlands and taking the conservative lower bound numbers, we see that the Nation's wetlands are worth at least \$1.4 trillion annually. This doesn't even include the cost of permanent loss of wetlands species. It is so hard to put a dollar figure on the loss of biodiversity.

I hope that you'll agree that the economically sound approach to this issue is one that does the most to preserve those wetlands that remain. I have to say in a biased way, I believe that S. 1195 and H. 350 in the House take the most effective approach to the issue of wetlands preservation.

As Congressman Edwards has said, our bill will aid farmers and others by improving the permitting process. I want to quickly in a minute or so and then I'll conclude flag for you a couple of issues that concern me in the administration's proposed wetlands policy. You've heard Congressman Edwards' view on a couple of those.

As you know, the administration has proposed that Congress provide funds to allow for State and local assumption of Federal wetlands programs. Existing law already provides for State involvement but there are very sensible safeguards that I hope the subcommittee will retain when it marks up the wetlands bill.

The Clean Water Act provides that a State can assume administration of the Federal wetlands program if that State institutes a wetlands permitting program that is at least as stringent as Section 404. In other words, we ensure a floor of national consistency in wetlands protection. Let us not give up that. I very much favor the State and local control when it makes sense but I'm concerned about the administration's vague proposals to turn wetlands programs back to the States.

They talk about flexibility but I hope that isn't a code word for weakened protection. We cannot sacrifice the wetlands in the name of enhanced State participation. That would not be a good tradeoff for our country.

The second issue I want to flag for you is the issue of the role of the Soil Conservation Service in regulating wetlands development. I am concerned and voted against the Bond Amendment as did many of my colleagues and I see this has come up again in the administration's proposal. While I support the work of the SCS, indeed I've fought to keep them going as an agency, really they are unfamiliar with the Clean Water Act. They have a little experience in implementing the wetlands provision of the Swampbuster component of the 1985 Farm Bill but I have a serious concern.

If you look at the role of the SCS, it's really to maximize the amount of productive agricultural land. I think that makes this agency less than objective on the issue of wetlands protection. So I urge that proposal be rejected.

In closing, I would say the massive and continuing destruction of wetlands reflects not only an environmental loss but a staggering economic loss that must be stopped. I hope that I can work with you and members of the subcommittee to ensure that the wetlands bill we eventually include in the Clean Water Act represents the serious credible response that the situation requires.

Again, I thank you for your courtesy and I really look forward to working with you on this process.

Thank you very much, Mr. Chairman.

Senator GRAHAM. Thank you very much, Senator Boxer. I might refer to you as the warrior Senator as you return to the floor. I appreciate your comments as well as those of Congressman Edwards. I commend you for the obvious serious thought and attention that you have given to this issue. Having now converted that into a specific piece of legislation, it will be extremely helpful to the subcommittee and it will be a major part of our consideration as to what to recommend to the Senate in this very important area.

Senator BOXER. Thank you. Congressman Edwards and I thank you very much for fighting for a clean environment as the Senator from Florida.

[Senator Boxer's prepared statement follows:]

STATEMENT OF HON. BARBARA BOXER, U.S. SENATOR FROM THE STATE OF CALIFORNIA

Mr. Chairman, I want to thank you for providing me the opportunity to address the Subcommittee on the subject of wetlands.

As you know, I have introduced S. 1195, the Wetlands Reform Act of 1993, to protect our nation's remaining wetlands. I am honored to be testifying today with the House sponsor of that legislation, Congressman Don Edwards.

As Californians, Congressman Edwards and I offer a unit perspective on this issue. Our state has the unfortunate distinction of having lost a greater percentage of its original wetlands than any other state—91 percent. Californians have realized late in the game the incredible economic and environmental value of wetlands. But it is not too late to stop the losses, and it is absolutely imperative that we do so before we lose the last nine percent of California's wetlands or the 47 percent of historic wetlands remaining in the rest of the continental U.S.

Protecting the nation's wetlands is one of the most important issues that Congress will face as it reauthorizes the Clean Water Act this year. Alarming, recent estimates indicate that the nation loses 290,000 additional acres of wetlands each year, or nearly one percent of its remaining total every three years. These losses continue because of loopholes in existing law.

The bill Congressman Edwards and I have introduced will help stem the tide of wetlands destruction by establishing as national policy the preservation of the quantity and quality of the nation's wetlands.

We need to make it clear that not only does wetlands conservation make good environmental sense, it makes good economic sense. Too often, wetlands conservation is portrayed as a luxury that an expanding economy cannot afford. Nothing could be further from the truth. Wetlands serve a variety of valuable economic functions that we cannot afford to lose.

For example, wetlands can play a key role in minimizing flood damage. This summer we witnessed some of the worst flooding in the nation's history. I urge the Chairman and the Subcommittee members to consider the experience of the mid-west and the \$5 billion cost of disaster relief as they mark-up the wetlands provisions of the Clean Water Act. Preserving our remaining wetlands is the best, most cost-effective way of preventing more extensive flood damage in the future.

Wetlands act as natural sponges for floodwaters, thereby reducing or eliminating the effects of destructive floods. Floodplains absorb overflows from rivers, streams and lakes, as well as agricultural and urban runoff, to retain overflows and reduce rates of flows, reducing damages associated with flooding. Coastal wetlands absorb and temper the impact of storm surges as wetlands associated with barrier islands,

salt marshes, and mangrove swamps act as giant storm buffers and weather major storm events without sustaining lasting damage.

The Fish and Wildlife Service reports that flood damage is *directly attributable* to wetlands losses. For example, the Service found widespread flooding in Iowa to be directly linked to that state's loss of 89 percent of its original wetlands. Minnesota's Department of Natural Resources reports that it will cost the state \$1.5 million annually—more than the state's annual flood control budget—to build flood control projects to make up for flood control functions that are lost along with the 5,000 acres of wetlands drained in the state each year.

In Massachusetts, the Army Corps of Engineers found that preserving existing wetlands in the Charles River was more cost effective, and provided better flood protection, than building extensive new flood control facilities. In fact, the Corps found that loss of the wetlands would have caused \$17 million in annual flood damage.

Rather than building the facility, the Corps acquired a portion of the wetlands. Annual costs for the project are \$617,000 while the benefit to the Boston metropolitan area is expected to average \$2.1 million per year.

Wetlands also play an important role in improving water quality. As we proceed with the reauthorization of the Clean Water Act, we should be aware that wetlands can control non-point source pollution by removing and retaining nutrients, processing chemical and organic wastes, and reducing sediment loads to receiving waters. Wetlands actually act as biological filters of our water supplies. A study performed by the State of Minnesota found that wetlands destruction in that state have resulted in combined federal-state expenditures of \$20 million annually to deal with non-point source pollution.

Wetlands can also replenish and recharge the Nation's groundwater aquifers. Over 50 percent of our people use groundwater as a primary water source, and yet we often overlook the importance of wetlands in the maintenance of clean water supplies.

In addition, wetlands provide critical habitat for a wide variety of plants and animals. The well-being of waterfowl and other populations is tied directly to the status and abundance of these habitats. As wetlands destruction has continued, we have seen waterfowl populations plummet to record low levels. A large number of federally listed threatened and endangered species also rely on wetlands for their survival.

In addition to animals, plants and birds, fishermen rely on wetlands for their living. Fish and shellfish need healthy and abundant estuaries for spawning and nursery grounds, migration and food production. Studies have estimated the fishery value of wetland habitats to be as high as \$14 billion annually. The loss of these habitats can have a devastating economic effect. For example, Mr. Chairman, I am told that shrimp harvests in your state of Florida have declined by more than 75 percent since the early 1980's—due largely to wetlands destruction.

While many wetland values cannot be quantified, economists have clearly established that wetlands are an extremely valuable resource. Their destruction should be weighed as seriously as the loss of any other national resource. The Subcommittee must very seriously consider that weighing process. It is true that quantifying the economic value of wetlands is difficult—the value of any one acre of wetland will depend on its particular characteristics and location—but fortunately, most functions have been analyzed sufficiently to establish ranges of values. Based on studies done on wetlands located in various states in various regions by the U.S. Fish and Wildlife Service, the Army Corps of Engineers and other public agencies, an economic analysis has been prepared under the direction of the School of Public Policy at the University of California at Berkeley. The analysis assigns a range of economic values to the various wet land functions.

Using my state of California as an example, the study shows that the total annual benefit of wetlands to the state ranges from a low of \$6 billion dollars to almost \$23 billion dollars. Those are the amounts the state would lose annually if 100 percent of our wetlands were lost to filling and development.

The study also arrived at a range of permanent values of California wetlands. That value ranges from a lower bound of \$78 billion dollars to an upper bound of \$286 billion dollars.

Applying this method of valuation to the nation's 104 million acres of wetlands, and taking only the conservative, lower bound numbers, we see that the nation's wetlands are worth at least \$1.4 trillion dollars annually. These estimates do not even include some costs of wetland destruction, such as the permanent loss of wetland species and the loss of biodiversity. For many, the value of species and biodiversity, though not measurable, are worth many times more than the benefits of wetlands that can be quantified.

So it should be clear to anyone that takes the time to consider the values involved, that the genuinely conservative, economically sound approach to this issue is the one that does the most to preserve those wetlands that remain. Considering all the bills that have addressed this issue in the Congress over the past several years, I believe S. 1195 (H.R. 350 in the House) takes the most realistic, most truly conservative approach to the issue of wetlands preservation.

At the same time, this bill will aid farmers and others by improving the wetlands permitting process. As a Senator from California—the state with the dubious distinction of having lost the largest percentage of its original wetlands—I understand the need to both protect our remaining wetlands, and to provide greater certainty for farmers and developers. The bill Congressman Edwards and I have introduced will strengthen the wetland protections provided in section 404 of the Clean Water Act, while streamlining and clarifying the wetlands permitting program.

I want to take a moment to flag a couple of issues raised by the administration's proposed wetlands policy.

As you know, the administration has proposed that Congress provide funds to allow for State and local assumption of the federal wetlands program. Existing law already provides for state involvement, and even state assumption, with some very sensible safeguards that I hope the subcommittee will retain when it marks-up a wetlands bill.

The Clean Water Act provides that a state can assume administration of the federal wetlands program if that state institutes a wetlands permitting program that is at least as stringent as the section 404 program. This requirement ensures a "floor" of national consistency in wetlands protection and is vital for state assumption to work without weakening wetlands protection standards.

When the Clean Water Act was first passed in 1972, it was passed for a very specific reason: local and state efforts to control water pollution simply were not working, and Congress felt that a strong national presence was necessary to protect the quality of the nation's waters. This is not to say that state and local protection efforts are irrelevant—but historically they have been inconsistent, frequently subject to political pressure, and often not structured to take into account the national interest in clean water.

This is why I'm concerned about the administration's vague proposals to turn the wetlands program back over to the states. I am concerned that the administration policy focuses on providing greater flexibility for state and local governments, without making sure that "flexible" does not mean weakened protection standards.

We must not sacrifice wetlands protection in the name of enhanced state participation. This is why the state and federal roles defined in the Clean Water Act have been retained in the bill Congressman Edwards and I have introduced.

The second issue I'd like to discuss briefly is the role of the Soil Conservation Service in regulating wetlands development. As you know, Mr. Chairman, the administration has proposed a policy similar to the amendment offered by Senator Bond last February. The Bond amendment would have transferred all technical determinations regarding wetlands on agricultural lands from the Army Corps of Engineers to the Soil Conservation Service. Like most Senators I opposed the Bond Amendment, and I oppose the administration's proposal for the same reasons.

While I support the work of the SCS, this is an agency which is unfamiliar with Clean Water Act procedures and which does not have training or expertise to implement Clean Water Act programs.

The SCS has had some experience implementing the wetlands provisions of the "Swampbuster" component of the 1985 Farm Bill, but there is a serious concern that Swampbuster and section 404 are very different and that the SCS does not have adequate expertise to assume the section 404 program. In addition, its purpose—to maximize the amount of productive agriculture land—may put the agency at odds with the goal of wetlands protection. I therefore urge that this proposal be rejected.

Mr. Chairman, the massive and continuing destruction of wetlands reflects not only an environmental loss, but a staggering economic loss that must be stopped. I hope that I can work with you and members of the Subcommittee to ensure that the wetlands bill we eventually include in the Clean Water Act reauthorization represents the serious, credible response that the situation requires. I believe S. 1195 is such a response, and I urge the subcommittee members to give it their serious consideration.

Mr. EDWARDS. Thank you.

Senator GRAHAM. Thank you very much.

Dr. Larson and Dr. Cooper, again, we appreciate your statements. I have a few questions I'd like to ask.

Dr. Larson, in your comments, you stated that you personally opposed and therefore applauded the fact that the administration's bill as well as the bill developed by the leadership of this committee did not provide for classification of wetlands into most, least, medium value, but you also said that you recognize that there were some wetlands that deserved special attention. There seems to be some conflict between those two statements. I wonder if you could elaborate as to your thinking?

Mr. LARSON. I hope there is not conflict.

We are already putting wetlands in different classes when we designate wetlands for the RAMSAR list under the Treaty of Wetlands of International Importance. The U.S. Fish and Wildlife Service has conducted a survey of wetlands in each of its administrative regions and has, for their purposes, from the wildlife point of view, designated certain wetlands that are of prime concern. EPA exercises under 404 the ability to go out and do advanced determination of critical wetland areas for the purposes that agency pursues. So in that sense, we already are identifying wetlands that have special ability to perform certain kinds of functions.

The analog to this are the S&L maps and the texts that accompany the maps, that are produced by the Soil Conservation Service. If I'm a developer or a farmer and I'm going to go out and buy a piece of land either to put a subdivision or I want to grow corn, I'd be smart to go look at the soil maps because the soil map will tell me which crops these soils are most suitable for or, if I'm a developer, which soils are going to give me problems in terms of drainage, in terms of stability of my structure and the like. Then I will act accordingly.

That base of information is well-established in soil science and my suggestion is that we should start applying wetlands science in the same fashion. We already have indication that the wetlands on the headwaters of streams in the eastern United States are much more important for water quality improvement and maintenance than are the wetlands in the midstream-downstream section. On the other hand, from a flood control point of view, those midstream wetlands are more important than the wetlands on the headwaters.

So if I came along as an applicant for a permit, I would like to be advised, based on what science understands, on which of these flaming hoops I should expect to have to go through. I think the regulatory agencies would also be better positioned to use their resources if the priority functions in these wetlands were laid out much in the way we have addressed soils.

Another analogy would be from the forestry community. You map forests but you also attach to that an understanding of what the stocking is, what the growth rate is and then you make plans on that basis on whether you're going to convert from hardwood to softwood, whether you're go to in and create a plantation. That sort of rigorously based information frame, I think, could be very useful both in the regulated community and from the regulator side as well.

Senator GRAHAM. Dr. Cooper, your discussion of some of the particular issues facing the more arid western States and the graphics

that you displayed raised the question of assuming that the Federal Government has the constitutional reach to cover all wetlands, is it wise public policy for the Federal Government to attempt to regulate all wetlands. Would you have any comments as to what level of government based on scientific, administrative capability, political will and capacity to make appropriate public judgments should have responsibility for wetlands?

Would you agree with Congressman Edwards, for instance, in which he would say the Federal Government should have total preemptive responsibility for wetlands?

Mr. COOPER. The Federal Government provides definitely the overview for some of these international and interstate functions such as waterfowl migration, flood waters and water quality which go beyond any State's boundaries. The Federal Government must stay involved at that level.

A second issue is that in the western United States, there is only one State that even has a wetland policy. That is the State of Oregon. I don't think any other State has a policy. I'm working with the State of Colorado now using funds from EPA to help them develop a wetlands policy. We see a lot of resistance even in the State to develop a wetlands policy. They are afraid to do anything.

In a perfect world, the place to address wetland issues is regionally at a watershed level. That's the level at which you can map and understand the wetland resources that you have, determine which are the most important ones to preserve, determine where impacts have occurred and restoration and possible. At that level, you can really have some decisive action, but again, there is not a lot of activity in that regard. In Colorado, I know of three or four advanced identifications as they are called to address regional wetland issues, develop priority plans for purchase and conservation restoration plans. I've worked on all of those and there is not a lot of others coming down the line.

The States and the regional governments really need some help and some oversight by the Federal Government to make sure that there is some protection and some conservation efforts that are ongoing and to help the states get involved at an even more detailed level.

Senator GRAHAM. Either Dr. Larson or Dr. Cooper, Senator Boxer raised some concerns about the SCS and its independence to make judgments in the wetlands area. There also have been questions about the scientific capacity of SCS to make these biological judgments. I wonder if, from your experience, you'd have any comment to make on that subject?

Mr. COOPER. Can I start on that? I've thought about that quite a bit. Obviously the SCS has a big presence in the western United States.

As you heard this morning, the big switch in 1985 from helping maximize agricultural gain to becoming a Swampbuster enforcer seems like a sudden switch. It's hard for me to understand that the agency entirely can switch that fast.

On the good side, the Soil Conservation Service personnel generally have excellent relationships with farmers and I think that gives them an in to avoiding some of the controversy in dealing with the public.

Several of the controversial things, for example I'm not sure what agriculture is. Is agriculture just related to commodity crops or are they looking at the Soil Conservation Service regulating all agricultural lands—in other words, forested areas, public and private grazing lands. This would include the entire western United States and take the SCS out of the realm of croplands which is where their expertise is.

The Soil Conservation Service personnel that I work with really know very little about natural hydrologic regimes, natural plant communities that are beyond the realm of croplands. I'm not sure that they are completely capable of handling this administrative process. I'm pretty sure they could be trained to do so, but it wouldn't be a rapid transition at all. The Corps of Engineers has spent a long, long time developing the expertise to regulate wetlands.

Senator GRAHAM. Dr. Larson?

Mr. LARSON. I would not like to cast gloom over the lovefest that we saw in the previous panel between the agencies but the fact of the matter is, first of all, from a political point of view, I think that it's important that the SCS have a participatory role, not unlike that the National Marine Fisheries Service and the U.S. Fish and Wildlife Service have had in the past in the 404 Program. The SCS is very close to the commodity crop community.

On the other hand, the SCS has a very, very small biological staff and the SCS statutorily is limited in terms of what it can do to encourage research, whereas the Corps and EPA both have brought to the wetland situation, as well as National Marine Fisheries Service and the Fish and Wildlife Service, a very robust involvement in the application of scientific research and the support of research. That has not been a role of SCS.

I would suspect that it would be useful for SCS to be involved but on a cautious, perhaps step-by-step-basis.

Senator GRAHAM. One other issue that was raised particularly by Congressman Edwards was the issue of the creation of artificial wetlands or the regeneration of degraded wetlands as part of a mitigation program. What is your assessment of the experience to date in terms of efforts to either revive or create wetlands?

Mr. COOPER. I've done a lot of research into that and I can tell you that restoring wetlands is a much more successful activity, although not a lot has really been attempted so far in the west. Creating wetlands in dry landscapes requires a lot of maintenance. You have to be there to make sure that water is getting to the site, it's very expensive and it's unpredictable.

An example of the kinds of research that we've just seen, a graduate student at Iowa State University just completed a thesis looking at the restoration of prairie potholes in the northern prairie States. These are done under the Wetland Conservation Program and others. She's found that after 5 years or even more—these are restoration projects—the kinds of vegetation that we see in the communities that develop are nothing like the undrained wetlands that existed prior to that or the undrained wetlands that still exist in the watershed. So our ability to even restore wetlands is definitely not very good.

The use of a mitigation bank for mitigating impacts is certainly a lofty goal and I would encourage it on a watershed basis where we know critical wetlands have been impacted, but still the functioning of these wetlands doesn't come up to snuff for many, many years. Some of these may never come back if there have been impacts that are as decisive as we know about.

Senator GRAHAM. Dr. Larson?

Mr. LARSON. The record is quite clear. Anyone who has taken a look at the success of wetland creation—usually that's only measured on the basis of whether plants grew there or not, there's been no real ability to measure their various functions—there's no better than a 50-50 chance that you will be able to create a wetland plant community.

The frustrating thing from the science point of view is when you try to go out and learn something from that effort and it's very difficult to do because in the first place most of these sites have not been preceded by a careful determination of what the functions were that were being lost on the original wetland. Therefore, there were no design criteria for the project. There being no design criteria, there are no criteria on which to measure the success. There have been virtually no efforts to monitor what has gone on afterwards, so it is extremely frustrating to know that there are perhaps thousands of sites at which this has been tried and yet we try to learn from that, there's very little to learn except that it's a high risk operation.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. Thank you, Mr. Chairman.

Dr. Larson, there's a lot of confusion about the growing season and I realize they vary, but I understand the growing season in North Carolina for wetland delineation begins in March and ends in November. That's an extremely long growing season, isn't it?

Mr. LARSON. For some wetland plants, there is no end to the growing season.

Senator FAIRCLOTH. Oh, this is the wetland plants, not crops? The growing season is for wetland plants, not the corn, soybeans, row crops?

Mr. LARSON. For some wetland plants at some latitudes, there actually is no end to the growing season.

Senator FAIRCLOTH. So then why have a growing season; what does the growing season delineate, wetland plants?

Mr. LARSON. Growing season has meaning in terms of crops.

Senator FAIRCLOTH. In terms of crops, it's too long. In terms of a cypress tree, you could add the 13th month, I guess. It keeps growing.

Mr. LARSON. Yes.

Senator FAIRCLOTH. So the growing season is for crops?

Mr. LARSON. That's the most useful and usual use of that term, the historic term. I think we're failing to communicate here.

Senator FAIRCLOTH. We are. What does growing season mean; what are we talking about? What's the growing season for corn?

Mr. LARSON. That's a different growing season than a cypress. There is a growing season for each species.

Senator FAIRCLOTH. That's a revelation, but which are we talking about?

Mr. LARSON. In what context?

Senator FAIRCLOTH. The delineation of wetlands is during a specific growing season?

Mr. LARSON. Yes.

Senator FAIRCLOTH. As set forth by the EPA?

Mr. LARSON. Yes.

Senator FAIRCLOTH. It is from the beginning of March until the end of November. If this is the wetland season, it's far too broad if we're talking about row crops, crops. If we're talking about wetland plants, of course you're right, it's year-round.

Mr. LARSON. The reason that it's appropriate to look at the growing season for the wetland plants is that the wetland plants and the soils are what are providing the functions that the wetland is performing. So if you're looking at the water quality role of wetlands in which plants and sediments are intimately involved, it's that growing season that's appropriate.

Senator FAIRCLOTH. Let me ask you another question. Would you say that all wetlands are of equal ecological value?

Mr. LARSON. I have a problem with the value. They have different ecological functions if you'll allow me to make that distinction. If by value, you're thinking of the use of value in terms of the proposals in the last Administration to put wetlands in high, medium and low value classes, I have a great problem with that because that begins to lump functions that are very different and that are performed differently in different wetlands.

A wetland in the eastern United States at the headwaters of a river system is much more likely to be important for water quality than a wetland at the midstream or at the mouth. However, if you look at wetland flood control, the wetlands in the midstream are much more likely to be highly important for that particular function than a wetland at the headwaters.

If you lump disparate functions like water quality, maintenance and flooding into one value class, there you've got some real problems.

Senator FAIRCLOTH. I'm told the single most reliable factor in making a wetlands determination is the soil of the land, yet the delineation manuals do not refer to a standard soil textbook, the so-called Soil Bible, the Soil Taxonomy. Very few Government delineators are familiar with this factor. In your professional opinion, shouldn't we require anyone who is doing wetland delineation to be versed in the soil?

Mr. LARSON. When the present soil taxonomy was published, the concept of hydric soils was not very well understood.

Senator FAIRCLOTH. When was it published?

Mr. LARSON. I can't give you the date.

Senator FAIRCLOTH. In the 1980's, 1970's or when?

Mr. LARSON. I believe it was in the 1970's. The classic distinctions that manual lays out are distinctions between organic soils and mineral soils. Hydric soils, which are the saturated soils that occur in wetlands, are both mineral soils and organic soils. Since the publication of that manual, the Soil Conservation Service and the soil experts in the U.S. Forest Service and in the Corps of Engineers have developed a very well understood definition of what hydric soils are. For each State, there is a published list of hydric

soils. These are the soils that are related to wetlands and it is a mix of the organic and mineral-based soils. I would say that someone who is engaged in wetland delineation needs to be very well versed in the hydric soils.

Senator FAIRCLOTH. The 1987 manual has sections which describe situations when "on-site inspection is unnecessary." Do you agree that prior to restricting a private property owner's right to utilize his own land, an on-site inspection should always be required?

Mr. LARSON. I think the private property owners should always have the right to insist on an on-site inspection. There are times when regulatory agencies are very willing to do a desk review and may not, on their own initiative, wish to go out, but I think the landowner always should have the opportunity to have that done.

Senator FAIRCLOTH. Do you have any feeling that we have too many overlapping rules and regulations and that some of the restrictions and constraints could be relaxed on private property?

Mr. LARSON. I come from a State and a town where we not only have the Federal Wetland Program, we have a State Wetland Program but on our own initiative, we have enacted a local wetland program.

Senator FAIRCLOTH. What State and what town?

Mr. LARSON. I'm in Massachusetts and I live in the Town of Pelham, about 1,300 people.

Senator FAIRCLOTH. That explains that.

Mr. LARSON. My own forest property where I had a woods road going through a wetland area and I bogged down wife's my four-wheel drive, I had to apply for a local permit as well as a review under the State level to make sure that my shifting that road out of the wetland was done in a way that would not harm the wetland. I am very comfortable with that. We're in a part of the country where we have a lot of wetlands and we have a lot of people.

It is curious to me. We started this business of wetland regulation 14 years before the Federal Government got involved and we seem to have been able to work out a relationship between the local, Federal and State governments so that we work pretty well on this. I would suggest that possibility is open elsewhere but it does mean that you've got to have local involvement, you've got to have State involvement and it's very difficult to come down from above and impose these kinds of things.

Senator FAIRCLOTH. Would you agree that a \$25,000 per day penalty is excessive and out of line with any reasonable realistic approach to penalizing a farmer? It wouldn't take many days at \$25,000 a day to chew up most of the farms in this country. That is what the penalty can be. Would you agree that the penalty is out of line and should be reduced to something more practical such as the value of the land involved?

Mr. LARSON. If I were a willful lawbreaker and if I had ignored successful warnings from the Corps of Engineers that what I was doing on my property was in violation of the Clean Water Act, I think that would be an appropriate level. I think the distinction has to be made, and it was touched on in the earlier panel, between the unwitting violator and the willful violator. There needs to be opportunities for the unwitting violator to undo the damage.

To that extent, that kind of penalty would probably be inappropriate.

Some of the most celebrated cases where citizens have gone to court, have been fined and jailed are from records of willful violators, repeatedly ignoring the agencies.

Senator FAIRCLOTH. Would you have any problem with codifying the fact that the penalty should be less rather than leaving it to the discretion of the Corps of Engineers or, in the case of Senator Boxer's bill, there isn't even an appeal? Would you agree to codify what stages it gets to \$25,000 a day?

Mr. LARSON. I think that might be useful.

Senator FAIRCLOTH. Thank you.

Senator GRAHAM. Any further questions?

Senator FAIRCLOTH. No.

Senator GRAHAM. Dr. Larson and Dr. Cooper, we appreciate very much your contribution. Dr. Larson, did you have a concluding comment?

Mr. LARSON. I would like to respond to your question to Dr. Cooper about the Federal role in wetlands. When you made the observation at the beginning of the day that this was an interest of yours, I wrote down a list of directions I thought that already existed.

Clearly, the Federal Government already has a mandated role under various international treaties and conventions. The Migratory Bird Treaty is well known. The Natural Heritage Convention conveys a certain Federal responsibility in some types of wetlands and the Everglades is an example.

Under the RAMSAR Convention on Wetlands of International Importance, I've been on U.S. and IUCN delegations to that convention, the United States already has accepted two obligations—one, to list certain wetlands under the RAMSAR. The second and less well know obligation under the RAMSAR Convention is the United States has the obligation to adopt national policies to ensure the wise use and management of wetlands, whether or not they are on the RAMSAR list.

I think from the international treaty point of view, there's already a broad framework in place. Clearly, the Federal Government has prime responsibility in international rivers and aquifers and in wetlands that are contributing to marine fisheries that go into international waters. The Federal Government's role, I believe, is also extremely important on interstate rivers, interstate aquifers, coastal fisheries.

If you begin to build that list and start to draw circles around the watersheds that contain wetlands that have these functions, you begin to comprise a very large part of the United States. So I would suggest that there is already a large role for the Federal Government but it is not an exclusive role, nor do I think it is a preemptive role because the whole process has to involve States and in some places, States may wish to involve municipalities.

Senator GRAHAM. There was a study in the mid to late 1980's I think done under the aegis of the Conservation Foundation which contains some recommendations as to what should be the areas of wetland jurisdiction, not as a matter of constitutional law, but as a matter of wise public administration policy, the Federal Govern-

ment should direct its attention to and the Federal Government should have a further role of encouraging States to accept and exercise jurisdiction over wetlands that fell beyond the appropriate Federal role. Are you familiar with that?

Mr. LARSON. If you're speaking of the Wetland Forum?

Senator GRAHAM. Yes.

Mr. LARSON. Yes, I was a science advisor to that activity.

Senator GRAHAM. Using that as a touchstone, to what degree would you support today its recommendations?

Mr. LARSON. I would still support those recommendations. I think one of the unfortunate events was that Forum produced a series of recommendations that truly had involved the regulated community, the conservation community and the regulators, both Federal and State. For various reasons that agreement fell apart. I would like to see that brought back together. The recommendations of the Forum, I think, are still worthy of serious consideration.

Senator GRAHAM. Dr. Cooper, do you have any concluding comments?

Mr. COOPER. I would just like to correct Representative Edwards' statement that there is not a wetland definition for the United States. There is a wetland definition published in the Clean Water Act. It is agreed to by most scientists it is accurate and can be used in the field, and it is used in the field.

Senator GRAHAM. Gentlemen, thank you very much for your contribution to our consideration of this important issue.

We have arrived at the conclusion of panels one, two and three. As previously indicated, panels four, five and six will be heard after the lunch hour. There has been scheduled one or more votes at 1:30 p.m. Based on that, I would recommend that we reconvene at 2:15 p.m. with panel four being our first topic.

Without objection, we will recess until the hour of 2:15 p.m.

[Luncheon recess.]

Senator GRAHAM. Call the meeting to order.

The hearing of the Clean Water Subcommittee of the Environment and Public Works Committee reconvenes to continue our discussion on wetlands policy.

Our first panel this afternoon will be Senator Murkowski to discuss some of the specific issues affecting the State of Alaska. As Senator Murkowski takes his place at the witness table, the Chair of the Environment and Public Works Committee, Senator Baucus is here. I'd call on Senator Baucus for any opening statement.

OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE OF MONTANA

Senator BAUCUS. Thank you very much, Mr. Chairman.

I want to begin first by complimenting you for your subcommittee's extraordinary work on the Clean Water Act. These hearings have been very comprehensive, they've been insightful, they've been productive, and you've done a terrific job. I'd just like everyone to know, at least from my perspective, you've done a terrific job and I thank you.

Today's wetlands hearing marks the end of the hearing phase for the Clean Water Act reauthorization. I also hope it marks the be-

ginning of a long awaited resolution on the divisive debate over wetlands policy. Wetlands are important to all Americans. Wetlands clean our water, wetlands protect us from floods and droughts, wetlands buffer our coasts against storms, wetlands recharge our groundwater aquifers, and our commercial and recreational fisheries depend on wetlands. Wetlands provide essential habitat for waterfowl, endangered species and other wildlife. Nationwide, support fish and wildlife that generate more than \$40 billion to our economy.

Unfortunately, while wetlands are important to all of us, we have lost too many of them. When George Washington convinced Congress to build the Nation's Capital along the Potomac wetlands, there were more than 220 million acres of wetlands in what would become the lower 48 States. Since then, we have lost more than half of those wetlands. In my own State of Montana, we have lost more than a quarter of our original wetlands. Nationwide, we continue to lose nearly 300,000 acres of wetlands each year.

Section 404 of the Clean Water Act is our Nation's principal means of stemming this loss. As such, section 404 is essential to achievement of the Clean Water Act's goal of maintaining the "chemical, physical and biological integrity" of the Nation's waters.

While section 404 is important, it has many problems. It is confusing, particularly for farmers and ranchers who must figure out how to comply with section 404, the Swampbuster provisions of the farm bill. Section 404 is often full of needless delays. Applicants for permits wait for months or years for a permit decision. When a decision finally is made, the only avenue of appeal is through the equally slow Federal courts.

Section 404 is often difficult to comply with. Determining what is a wetland and whether a Federal permit is required is beyond the financial and technical ability of many small landowners. Section 404 does not adequately encourage State involvement in wetlands protection. It does not provide for adequate coordination on all levels of government.

Section 404 does not adequately protect against wetland losses. Drainage and excavation of wetlands has not been regulated under section 404. The individual permit process under section 404 has resulted in a piecemeal approach to wetlands protection and under section 404, the cumulative impacts on entire watersheds have often been overlooked.

To address these problems with section 404 and to promote the protection and restoration of wetlands, Senator Chafee and I have introduced S. 1304, the Wetlands Conservation and Regulatory Improvements Act. The four has four principal goals. First, the bill will enhance the protection and restoration of wetlands nationwide. It will enhance it. Second, our bill will make regulation of wetlands more fair, efficient and consistent. Third, the bill will make it easier for farmers and ranchers to comply with efforts to protect wetlands. Fourth, our bill will strengthen the Federal-State conservation partnership.

I believe that S. 1304 is a fair and balanced approach to wetlands protection. I'm pleased that the wetlands initiatives recently announced by the administration so closely parallel our bill.

Mr. Chairman, I look forward to hearing from today's witnesses about the problems they see with wetlands protection in this country and hearing their views on S. 1304 and other wetlands initiatives. I look forward to working with you and other members of the committee as well as other Senators—believe me, we both know there are many of them who are interested in this issue—in moving toward the legislation that assures balanced and effective wetlands protection.

Than you very much.

Senator GRAHAM. Thank you very much, Mr. Chairman. I appreciate that statement.

We are honored to have as our first witness this afternoon, Senator Frank Murkowski of Alaska. Senator Murkowski?

**STATEMENT OF HON. FRANK H. MURKOWSKI, U.S. SENATOR
FROM THE STATE OF ALASKA**

Senator MURKOWSKI. Thank you very much, Mr. Chairman.

On behalf of my senior colleague, Senator Stevens, who unfortunately had to go back to Alaska for a funeral of a very dear mutual friend of both of ours, I'm pleased to say this testimony that I'm about to give represents the consensus of our delegation.

First of all, let me thank you for the opportunity to testify. I think the commitment of the Chairman, Senator Faircloth, and others relative to the necessity of addressing the resolve of our wetlands situation with the emphasis on conservation is certainly appropriate.

Someone said, if the shoe fits, wear it. I'm reminded of the opening statements relative to the State of Montana and would ask that a list of wetland loss of all States be included in the record.

Senator GRAHAM. Without objection.

NOTE: Surface area - There are some discrepancies between the total surface area of states. These differences are probably due to shifting river channels forming state borders. The area given is that presented by the U.S. Geological Survey, National Atlas of the United States, 1970.

Wetland distribution and changes vary dramatically within states dependent on both geographical and/or land use patterns.

Senator MURKOWSKI. The State of Montana shows approximately 27 percent of its wetlands as being lost. I think Senator Baucus used the figure of 30 percent. In any event, Florida has a 46 percent loss. My State of Alaska, less than one half of 1 percent has been lost.

Senator BAUCUS. Aren't there States with greater loss. Illinois on that list, isn't that close to 90 percent?

Senator MURKOWSKI. Oh, absolutely. Illinois is 89 percent loss. I think that I would certainly concede New Jersey is one of the States with a relatively small amount—no, it's 39 percent. Even New Mexico is 33 percent. My reference to, "if the shoe fits, wear it," is reflected on the realities associated with uniformity in the application of wetlands legislation and the recognition that the problem is not in my State of Alaska. The problem, as it exists, is with the other 49 States relatively speaking.

I would implore you as you reflect on my testimony to recognize that Alaska has only been a State for 34 years. As a consequence, we find ourselves in a rather unique position. I would ask that you refer to the fact sheet that is before you relative to the public lands that are already withdrawn in Alaska under the first portion which you can read at your convenience relative to the fact that 51 million acres of Park Service land is in Alaska which is 70 percent of the Park Service acreage, 76 million acres of U.S. Fish and Wildlife Service refuge are in Alaska, 85 percent of all Fish and Wildlife Service lands; 90 million acres of BLM lands, 34 percent of all BLM lands; and there are 57 million acres of wilderness designated in Alaska, 60 percent of all the wilderness designation in the United States.

If you go down to the wetlands, you'll see there are approximately 170 million acres of wetlands in Alaska; 40 percent or 68 million acres are already protected in perpetuity within Federal and State conservation units and further, wetlands cover 45 percent of the surface area of our State. So we are rather unique in that regard. Seventy-four percent of the nonmountainous areas of the State are wetlands and on the North Slope, 99 percent of the surface is wetland.

Wetland loss in Alaska is 80,000 acres, less than one-half of one percent. That is over the last 126 years. So as you reflect on this legislation, please recognize that at the current rate of development in our State, it would take about 250 years for Alaska to develop even one percent of its wetlands.

I've also provided you with a national wetland policy issue which is available to others. I would encourage you to refer to page 14 because I think it makes a reasonable case for consideration that Alaska's wetlands are well-protected. If you refer to the chart at the bottom of page 14, you'll see the Federal and State oversight requirements relative to any activity on Alaska's wetland.

At this time, I'm told that there is a meeting that Vice President Gore has consented to attend in Senator Dole's office relative to reinventing government, to try and make government more efficient, more responsive. I would ask that you reflect and the professional staff reflect as well on the oversight as highlighted in the document on page 14 because I think it fairly applies to the reality

that indeed the regulatory oversight is established, is functioning and is balanced between Federal and State.

To be specific, I'm concerned that some of the provisions in the Senate bill 1304 will simply not solve our wetlands problem in my State and in some cases, make things simply worse. I think that the Senate bill 1304 would continue the no net loss, plus it would set a long-term goal of increasing quality and quantity of wetlands. The no let loss is unnecessarily restrictive as a goal in my State of Alaska. Increasing wetlands in my State that has almost 180 million acres of pristine wetlands simply doesn't make much sense.

The bill expands the definition of fill and regulates additional activities in wetlands such as dredging, draining, building on piling and the bill doesn't solve the problem of definition of wetlands or account for wide variations in abundance, function and value. It does not account for permafrost wetlands. Clearly, when the committee was reflecting on the definition of wetlands, the application of permafrost, which is unique to my State and virtually my State alone, was not a consideration but permafrost in most cases does constitute wetlands. The restriction there under the definition means that you simply can't build on this area which makes up a significant part of the geography in the State of Alaska.

So without modification, Senate bill 1304 will constrict and you might as well say, strangle the development in Alaska by providing more onerous Federal conditions, more compensatory mitigation, more delays. It will mean less community expansion, less community facilities constructed, and less resource development in Alaska. Again, I would refer to the fact that we've only been a State for 34 years. So what we're attempting to do today, other States achieved 100 years ago without the science and technology, without the safeguards, without the regulation that currently exists.

The President's proposed wetlands policy, what about it? I think it's similar to Senate bill 1304 but it contains four significant errors which I would like to identify for the committee. The Administration policy assumes that the Wetlands Regulatory Program is working fine in Alaska. That's not true. It's not working fine. The President's Task Force on Wetlands received testimony from the delegation, from the Governor, the Native community, other residents of Alaska and industry groups and we all pointed out that serious problems were distinctly associated with the wetlands program.

The policy rejected the Alaska 1 percent rule. The Alaska 1 percent rule was simply a way to address the dilemma associated with development on an area which most of the ground qualifies as wetlands. Under the regulatory oversight of no net loss, you simply cannot get there from here in Alaska because there is no provision other than mitigation. So the 1 percent rule was to apply to all States, including Alaska with the theory that all States had already exceeded the 1 percent rule but Alaska would not. It could come up to the 1 percent rule and that's all, which seemed rather simplistic perhaps in the bureaucratic process but nevertheless was functional and agreeable with some concern on the part of Alaskans, but nevertheless, it was a way to get there from here and it seemed to be reasonable and responsible.

The President's policy rejects the 1 percent rule on the grounds that the rule would deregulate wetlands development and some 1.5 million acres of wetlands would be destroyed. That's not true. In fact, the 1 percent rule would only remove the requirement for compensatory mitigation. How can you have compensatory mitigation when you don't have anything to mitigate, because you've had no development. We've got 80,000 acres of wetlands that have been developed.

Other mitigation measures such as avoidance and minimization would remain in place. Alaska's wetlands would remain regulated by the Clean Water Act and all the existing Federal, State and local laws which we are entirely supportive of.

The President's policy, point three, would claim that potentially all of Alaska's coastal wetlands would be destroyed if the 1 percent rule were adopted. This simply isn't true. Alaska has a very effective coastal zone management program developed in accordance with the Federal Coastal Zone Management Act and the CZM program is developed specifically to protect the valuable resources of the coastal zone and sets more rigorous standards for approval than the 404 Program alone.

Fourth and last, the President's policy claims that if the 1 percent rule were adopted, it would hinder management efforts of threatened and endangered species. That's not true either. Nothing about exempting up to 1 percent of Alaska's wetlands from compensatory wetlands would interfere with any management activities required by the very powerful Endangered Species Act which we all respect. Finding a reasonable policy to allow development of a small percentage of Alaska wetlands does not equate to total wetlands destruction.

As you note, we have 170 million acres of wetlands, equal to the size of the State of Texas. Alaska has 65 million acres more wetlands than all the wetland of the lower 48 States combined. I have excluded Hawaii. In Alaska, you can find a place to build on but you might find that it is a wetland more often than not because wetlands cover 45 percent of the State, 74 percent of the nonmountainous areas of the State are wetland. On the North Slope, as I've said, 99 percent of the surface is wetland. So Alaska is completely saturated with wetlands and you might say we're all wet. I'm sure by now some of you might agree. But many of Alaska's wetlands are permafrost wetlands that very frankly have a lesser value. In areas with an abundance of wetlands, uplands are often the higher value habitat.

I'd like to show you some photographs because it's pretty hard to depict Alaska unless you've been there and recognize the realities associated with the geography and the land mass. Before I do, I have a little more here.

I'd like to reemphasize that we really don't have a wetlands problem as the problem exists in the other 48 States because our wetlands are not really endangered as a consequence of Federal and State prevailing policies and the fact that we have virtually a very small amount of wetlands that have been developed, as I indicated, 80,000 acres or less than half of 1 percent over the last 126 years. No other State in the Nation has over 99 percent of its original wetlands. In fact, no other State even comes close. California,

I'm told has lost 91 percent of its wetlands. That's nearly 1,000 times greater percentage loss than Alaska. The national average is 53 percent, 500 times greater loss than Alaska.

If you compare this with the lower 48 States where over 50 percent of the original wetlands have been lost, the lower 48 States loses over 270,000 acres per year, three times more acreage lost in one year than Alaska has ever lost. We already contribute greatly to the Nation's wetland resource. We don't feel we should bear the burden of unnecessary and unworkable wetland regulation that allows us virtually no growth at all. We do our fair share, as I've said and you have in the handout, 68 million acres of wetlands are already protected within Federal and State conservation units. They will never be developed, they are protected in perpetuity.

Let's go to the photos. Let me show you the dilemma of our problem. The large photo on the left is the one we're going to start out with. That photo shows an area 60 miles across, 23 miles north and south. That photo shows about 1,400 square miles. It shows continuously poorly drained permafrost wetlands. It shows you an area that goes on for 1,000 miles across the Beaufort Sea, the coastal plain, but it also happens to show you Prudhoe Bay where 25 percent of the U.S. oil production has been flowing for the last 18 to 20 years.

If you look at that photo you can readily see the dilemma. Not only is it wetlands, it's permafrost. To mandate legislation that would suggest that in order for any development to occur, you initiate corresponding mitigation, I implore you to reflect on the reality of where that mitigation is going to occur. You are simply going to disallow the development within the oversight of both Federal and State on any areas within Alaska that qualify as wetlands.

Let me show you a small area that is in red because that reflects on the Prudhoe Bay production and camp facilities which are enlarged on the next photo. Would you show the audience the large photo while we're working on the next one so they will know what we're talking about. That's 1400 square miles.

The Prudhoe Bay facilities are represented in that picture that Alan has before you which shows you again that is an onshore facility, not an offshore facility. That's land at the North Slope. It's mostly water though, isn't it. You have wetland as far as the eye can see. A no net loss concept would prevent, prohibit, eliminate these projects. When everything is already wet, how do you create more? In my State, where and why do you conduct compensatory mitigation? This is the dilemma we have which is unique, if you will.

Let me show you a couple of other photos as well because I think they represent a reality. What you have in the next photo is a little different because this represents the closest thing to offshore activity in the State of Alaska. It represents the Endicott Field. That field is on a gravel island offshore with a causeway and it came in as the tenth largest producing field in the United States at 100,000 barrels per day. Senator Faircloth has that and that is a BP production facility. That's an offshore facility that's not very far offshore. It's within the 3 mile limit so it really doesn't qualify as offshore.

The significance of that is it came in as the tenth largest producing field in the United States. Today, it's the sixth largest field in the United States. It's producing at about 100,000 barrels a day. That's the technology that we've been able to develop. How big is it? It's less than 60 acres. That's the kind of technology that is applicable in Alaska today. As a consequence of cost, it's not good enough to find oil, you've got to find a lot of it in order to bring it into production. How can we do that in compatibility with the ecology and the environment and that's by reducing the footprint. That's just what we've done. That would be basically eliminated because it's extended the land by the causeway.

We're proud of this technology and we think that we can add something if you will to the wetlands problem by Alaska being used as an example of how to do it right.

This represents a general tundra area in the Arctic, in the North Slope area of Alaska and represents one of the river drainages that for all practice purposes is dried up in the wintertime and flows only in the summer.

This shows the North Slope or ANWR which has received an awful lot of consideration by Congress on the merits of opening it up for a limited exploration and drilling. It's believed to be the largest potential of any major oil discovery left in North America. That's what it looks like in the wintertime and there's 19 million acres out there in ANWR. That's a pretty big chunk of real estate, bigger than the State of Massachusetts.

The proposal by industry, if allowed to develop, is to develop, if the oil is indeed there, an area of about 12,500 acres out of 19 million acres which would be the production facility. It would be like having the Dulles International Airport in the State of Virginia as the only single footprint in the State and the rest of the State were a wilderness. Those are the kind of proportions that I'm trying to communicate to my colleagues.

We'll go to the next one because this represents the same area of ANWR in the summertime. That's what those 19 million acres look like for about 6 weeks of the year.

I guess that's all the photos. So you can see what a no net loss policy means in Alaska.

In conclusion, gentlemen, the wetlands program as regulated by section 404 of the Clean Water Act simply has not worked in Alaska. We have property owners in Alaska regularly experiencing ridiculous bureaucratic nightmares and I know you folks share that as well, senseless projects, delays. We have opposition in some projects from storing snow as it accumulates in parking lots and roads without the proper 404 permitting. Of course this kind of bureaucracy in an area where you get a lot of winter snow is simply unconscionable. When you have the responsibility of representing your constituents with these bureaucratic nightmares, it grows even more frustrating.

We're faced with realities that the community growth is stymied, houses cannot be built, community facilities for basic health, education, safety and sanitation can't be built. It's true the Corps of Engineers claims that they rarely deny wetlands permits and this technically is true, but as you and I know, the Corps requires an extraordinary amount of permitting information which has been

expanding, endless requests for additional information. The average person responding to it is absolutely overwhelmed; few individuals are in a position to preserve and persevere through this onerous process. So the effect is basically the same. Denial is probably the most insidious form of bureaucracy that exists.

I've had constituents come to me and say their property has been designated as wetlands. That amounts to a taking. Maybe they had a lot or two in an industrial area in Fairbanks, Alaska. They've been paying taxes on it as a potential for industrial development and suddenly, it's determined because of the application of an interpretation of wetlands to be determined as wetlands, therefore, it's a cloud on the title, the ability to build and develop is stymied dramatically and the person is left with an appeal through his congressional representative. What I must do obviously is appeal to you for some kind of rational reason to address those realities as they exist in my State where I hate to say it, but things are different.

We have, in our Native Land Claim Settlement Act of 1971 which the Federal Government under the sanctity of the contractual commitment, gave the Native Alaskans the right to select certain lands in exchange for extinguishing their aboriginal rights to the land and the settlement was to provide for some real economic incentives for our Native people. Unfortunately, the current wetlands program prevents the Natives from developing their own selected lands. The current wetland program violates the spirit of the Alaska Native Claim Settlement Act. It also violates the spirit of the Alaska National Interest Land Claims Act. The land not placed in conservation units was intended to be available for development. Development of Alaska's abundant natural resources was the economic promise of Statehood. Those are the terms and conditions under which we accepted Statehood, that we would have an opportunity to develop responsibly our resources. I think we have done that and the reality associated with the modest wetlands development that we have, less than one-half of one percent.

So basically both the State and the Nation are being deprived of the benefit of responsible development. It is simply not right to solve or attempt to solve the lower 48 wetland problems in Alaska. We should not be held hostage by the problems and mistakes of the lower 48.

We recommend some specifics and I would encourage you to reflect on them. We think the wetlands legislation should recognize that wetlands vary in abundance, they vary in functions, they vary in value. With our 175 million acres of wetlands, much of which is abundant, we recognize much is low value, much is permafrost. There should be some priorities. Regulation should be based on the extent and proportional loss of wetlands. Alaska has nearly all of our original wetlands in tact.

Some credit should be given for wetlands that are already protected. We've got 68 million acres protected in perpetuity, 40 percent of our total wetlands are protected in Federal and State conservation units in perpetuity. Permitting should be simplified and streamlined so that the process can basically work. I'm pleased to say that we hope that the Vice President's commitment to the reinvention of government can address this. We all want it to happen,

yet we want to have responsible oversight, but by the same token, the system has to work.

Gentlemen, I can tell you, if you are on the other end of a wetland problem or wetland permitting, God help you. I would venture to say none of us could basically do it alone without hiring engineers and professional help. That's a terrible burden and a terrible responsibility to mandate on the public when it's not necessary. General permits and local government wetlands planning should be encouraged. Regulations should recognize and protect the property rights of private property owners because what we're doing here in the mandate is a taking with no repayment by the individuals. It will be interesting to see how this committee reflects on the dilemma associated with the recent floods in the midwest and the realization of reclassifying productive farmland that clearly is a wetland designation, is it a taking, do you have an obligation to make a payment to those landowners. It will be interesting to see and I don't envy you the difficulty in addressing that dilemma but it is as much a responsibility for this committee to deliberate and debate as it is in the inclusion of wetlands legislation that's workable.

Regulation should not conflict with the economic goals of the Alaska Native Claim Settlement Act and the promises of Statehood under the Alaska Land Claims legislation. The State should be able to assume the Federal wetlands program more and more and manage it in a way that makes sense in that State subject to Federal guidelines and conformance because if the State doesn't meet the Federal guidelines, obviously the realization is that the Federal Government will take it over.

Alaska needs a wetland policy that allows the continued responsible development of our abundant natural resources. We've demonstrated the ability to balance the environmental protection with resource development and the rest of the country simply has not. So let's solve the wetlands problem where there is a problem.

I thank you for the opportunity to make my extended remarks. Again, I would appeal to you to recognize the dilemma that is unique to our State. I would be happy to respond to any questions you may have.

Senator GRAHAM. Thank you, Senator.

Senator BAUCUS, do you have any questions?

Senator BAUCUS. Thank you very much, Mr. Chairman.

Senator, I think you've touched a cord that most people would agree with, namely the frustration with delays and problems with the section 404 Program. As I'm sure you know by looking at the bill that Senator Chafee and I introduced, many areas, in fact every area that you've mentioned, I would think meeting with your approval except for the one and that is the failure to have a 1 percent exemption.

For example, there are provisions in the bill which do encourage State assumption of wetlands permitting process and so forth. In addition, there are very definite time limits, 90 days within which the Army Corps must issue a permit. Beyond that, at least with respect to a lot of farmers around the country, prior converted cropland as of 1985 is all exempt, so those farmers who did convert as of that date would have no concern under the Act.

We have one stop shopping at SCS and avoids the problem that many have with going to the EPA, the Corps, the Fish and Wildlife Service, et cetera. General permits, we do expand the use of general permits in the bill. The agricultural exemption is made more clear. There are many areas in the bill that deal with the frustrations you're talking about.

I grant you Alaska is a different State and I've been up to the North Slope several times in summer and winter. It's a different part of the world, there is no doubt about it. I think a 1 percent exemption, the question that comes to my mind is, because Alaska is so big, it reminds me of the law of averages, 1 percent of something isn't very much, but 1 percent of Alaska is a lot. So we're talking about what part of Alaska. That is, is it the permafrost up the North Slope, is it wetlands down around Anchorage? There's lots of different wetlands and different characteristics of wetlands in Alaska.

I'm wondering the degree to which you could indicate to us whether some kind of Alaska provision, if that made sense to you, would have some greater effect on some parts of Alaskan wetlands as opposed to some others?

Senator MURKOWSKI. First of all, I appreciate your sensitivity and I would certainly agree that there are many aspects of the legislation which we do agree with, the one stop shopping particularly. As far as the dilemma that we're in with regard to how we address some relief for Alaska, we would like to encourage prioritization of wetlands and consideration on whatever relief formula we might come up with would be based upon that prioritization because we recognize that some areas have a higher value—a bird nesting area, an area where eagles perhaps have their nests—and to allow for development initially on the lower value wetlands I think makes sense and I think all of us would agree in our own States as we look at the wetlands application that there should be a prioritization.

What we're looking for is some kind of relief and the 1 percent gave us that relief. That would be 1.7 million acres which would be the maximum developed. You talk about that percentage out of the whole, we have 365 million acres in our state. So we don't think that is an unreasonable request because 1 percent of our total 170 million acres would be 1.7.

Senator BAUCUS. The data I have here is between January 1972 and October 1992, roughly a 20-year period, the Corps received about 4,000 wetlands permit applications for activities in Alaska. Of these, 108 were denied and the Corps issued permits to 3,017 and of the remaining 872 applications, they were either withdrawn or otherwise inactivated.

I wonder if you could tell me generally in what parts of Alaska were those wetlands permits generally denied and where were they generally granted?

Senator MURKOWSKI. It's pretty hard to tell you specifically but I can generalize with a good deal of accuracy and say all over. It can be an individual's driveway from their home which is located perhaps by a river up to the highway. The application is the vegetation, the water content, any number of considerations. If there is a rivulet coming down a mountain and within so many hundred

yards, you happen to build a school and that rivulet flows into an anadromous stream within so many hundred yards and that flows into salt water, that place where you're going to build the school may be on a mountaintop as it was in Juneau and be denied as a consequence of it being in violation of the Clean Water Act under the 404 permitting process.

Senator BAUCUS. What I'm really getting at though is on the North Slope, I'm just curious if any oil company applications for 404 from the tundra up the North Slope been denied or not?

Senator MURKOWSKI. It goes a little further than that, Senator Baucus because as you know, this legislation would require mitigation. The problem you run into is what do you mitigate? Do we have to force Alaskans to go down to California and buy some wetlands—buy an area in wetlands that have been developed and turn it into its natural state so that we can develop something in our State when we have nothing left to mitigate? That's the dilemma really.

Senator BAUCUS. Is that what has happened?

Senator MURKOWSKI. What we have as a consequence of Federal and State policy is to try and initiate mitigation in those areas where we have had modest development. Let's say there is an oil pad on the North Slope that's dry, it's mitigated, it's going back. If you apply your legislation or the administration's legislation, we simply are left without mitigation capability. We have to go someplace else under the letter of the law. That's the major dilemma and I think that's where we part in how we get there from here because there is a lot of your legislation that we can live with that we can work with.

Senator BAUCUS. I understand. Indulge me with one final question. I'm just trying to get some information here. Have applicants in Alaska been forced to restore, mitigate wetlands in other States to compensate for wetlands that have been filled say in Alaska?

Senator MURKOWSKI. The problem is very complex because there is a delay factor here. If you have a major project in the North Slope, the permitting, there's over 44 permits that have to be granted. Development can take as long as 5 years and that is a reality associated with the development of the Kuparak area which is an oil producing area. You're talking about a sophisticated industry with the technology and the engineers to address the realities associated with the economics of whether they are going to go ahead and fight this process for 5 years based on their anticipated return of the resource vis a vis the mom and pop that suddenly have had a couple of lots in the industrial area in Fairbanks where Fairbanks grew up and why did it grow up in wetlands, because it was along the river and that's where the initial development occurred and where the town is because it's level. That's where the railroad is because it is level. You can't get permits. The time, the cost of obtaining those permits, many people just go away in frustration.

Senator BAUCUS. I totally agree and the main thrust of this bill is to address that issue. The Corps of Engineers submits to this committee data which says that in Alaska from January 1, 1991 to June 30, 1993, only two percent of permits required mitigation. Is that accurate or is that inaccurate, in your view?

Senator MURKOWSKI. The point is under the interpretation of the law, there is a mitigation requirement. There is some flexibility in the Corps' interpretation but less and less all the time because there is fear of a suit being filed and many suits are filed challenging the Corps interpretation. So the Corps is becoming more and more skittish. They are doing a better job on the environmental impact statements and that's fine for industry that can meet those requirements but the average person that's got to try and get a permit to put in a driveway and has to hire an engineer to provide the plans and specifications just because his or her particular land addresses water solubility—you have the same problem in your State and I know you do in Florida and other areas and that is why the one stop shopping I think makes a lot of sense.

I think there is an awful lot of this, Senator, that we can work out but where we are left high and dry in wetlands is on the application of mitigation and I would implore you to try and work with us to help us put some kind of responsible structure that we can proceed in our State because if you do it uniformly, we're out of business.

Senator BAUCUS. I hear you. I'm just trying to ask questions to determine how we can put this together because Alaska is different, there is no doubt about it.

Thank you very much.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. Just sitting here doing a little arithmetic, you only have 5 million acres in all of Alaska in private hands?

Senator MURKOWSKI. That's correct.

Senator FAIRCLOTH. Assuming some sort of governmental agency controls or owns all the rest?

Senator MURKOWSKI. That's correct.

Senator FAIRCLOTH. They cannot develop it as they see fit, I assume that's right. They don't have to let public lands be developed if they don't want to?

Senator MURKOWSKI. That's correct but recognize that not only is it not likely to be developed, a lot of it cannot be developed because it is wilderness.

Senator FAIRCLOTH. But even if they allowed any development on it, it would be an infinitesimally small percentage. If every inch of the privately owned land was wetlands, it would only be 1.4 percent.

Senator MURKOWSKI. I believe the Senator is correct, yes.

Senator FAIRCLOTH. If every inch of it was wet. I think it is ludicrous for us to pass a law or rule or regulation to constrict the growth of a 34-year-old State and apply the same rules that apply to those that have been developed over many years and other wetlands. I have a totally different feeling on the entire wetlands issue. I think it is a weapon, a tool that we have placed in the hands of an entrenched bureaucracy that penetrates three or four different agencies that all sing to exactly the same tune, to gain further control over private property and the abuse of private property rights.

I think if the wetland issue wasn't there, they would pick up the dry land issue or there would be an issue because there is a concerted attempt on the part of the bureaucracy to get control of pri-

vate property, one way or another. I think the wetlands is the current issue.

I know you might not even know but was there not an attempt to stop and to stop a homeless shelter in Juneau because it was on wetlands? Are you familiar with such a story?

Senator MURKOWSKI. Yes, that's St. Vincent de Paul Shelter. It was delayed over 2 years even though the land immediately around it had modest development on it. We've had several of those. We had another one in Sweitser Creek in Juneau, a middle school delayed for 2 years because of an EPA concern, even though it was on the side of a mountain. That was the interpretation of wetlands I spoke of where a drainage area came down the hill near the school, just a little creek, no fish at any time, dried up in the summer but flowed, but it flowed eventually into an anadromous stream within 3 miles from the location which flowed into salt-water and that qualified this mountain site for the school as wetlands.

So what we've got here is clearly something that I'm sure wasn't legislative intent in the definition but when you pull all the spaghetti out, you find you can't build there because of this series of coincidences, all well-meaning, but in my particular case, impractical because we have in southeastern, as you know, mountains that go right down to the sea. It wasn't designed for that, it was designed for more the application of a flatter topography.

I just want to make one other comment. I think it's interesting to note that in none of our discussion—you touched on it, I mentioned it—but there is a concern in the committee I think for the realization of these classifications on private land which amount to a taking and what kind of an obligation this committee has as well as this Congress to address that reality as you look at your wetland and Clean Water legislation pending.

Senator FAIRCLOTH. It is absolutely cause for concern with me. We must have hundreds of thousands of people out here agitating and working and in the bureaucracy to protect wetlands. If we have one solitary soul with an interest in protecting private property rights, he hasn't spoken within the Federal Government. That was part of the Constitution.

Senator MURKOWSKI. I haven't heard him either.

Senator FAIRCLOTH. If he's here, he sure hasn't said much.

Senator Baucus keeps saying you can get the permit. I am confident that Exxon knows how, has the time, the people, the engineers, the environmentalists, the hydrologists, to get a permit. Poor Farmer Brown can hardly find his way to the courthouse to file a deed and he is far from being able to file for a permit with the Corps of Engineers and the EPA. If he doesn't get the proper permits, he is subject to a \$25,000 a day fine which would probably consume the value of his farm before breakfast.

All these people are saying the same things from whatever agency they represent. They read a common statement this morning, a common statement from five government agencies. A Dr. Larson from Amherst, Massachusetts sat exactly where you are and told me that there was no difference in the value of wetlands, it all had the same value, whether it was 50,000 acres of brackish

marsh or a quarter of an acre pothole isolated in a field. Of course he was from Massachusetts, so I understood.

[Laughter.]

Senator FAIRCLOTH. I hope, before this wetland issue is settled and goes to the White House to be signed, that somewhere some common sense for the protection of property rights and the people of this country will be written into the bill as well as the protection of wetlands.

Senator GRAHAM. Senator, we appreciate your very thoughtful presentation and I can assure that your comments will be given full consideration as we proceed with this legislation.

Senator MURKOWSKI. Might I ask the Chairman the general time frame under which you anticipate further hearings and a mark-up?

Senator GRAHAM. This is our final hearing. This is the eighth hearing that we've had on this legislation. Our schedule is to have a bill ready for subcommittee mark-up in October and depending on when this session of Congress recesses, possibly to have it before the full committee prior to that recess.

Senator MURKOWSKI. I don't want to suppose something that's not there, but if the members and more specifically the subcommittees are receptive to considering some kind of—I hate to use the word exception—redress for our particular set of circumstances, might we have the opportunity to be afforded the courtesy of that knowledge and perhaps the opportunity to try and work with the subcommittee in addressing some responsible relief?

Senator GRAHAM. Yes. We look forward to working with you and your colleagues and whatever representatives of the State and citizens of Alaska are interested in pursuing what might be some reasonable recognition of your special circumstance.

Senator MURKOWSKI. May we do that by contacting your Chief of Staff?

Senator GRAHAM. Yes.

Senator MURKOWSKI. I very much appreciate that, Senator Graham, Senator Faircloth, Senator Baucus and the professional staff associated with this. I assure we in Alaska are not at all inclined to abuse the realities associated with responsible wetland reclamation. We just have this unique reality where our State is already wet and it is pretty hard to be any more wetter than wet. That's why the mitigation in the administration's proposal and Senator Baucus' proposal leaves us with such a dilemma.

Thank you very much for the opportunity to address the committee.

Senator GRAHAM. Thank you very much, Senator.

Panel four, I would ask if the members of this panel would please come forward and you will be called upon in the order in which you are listed on the agenda starting with Mr. Scott Hausmann, Chairman, Association of State Wetlands Managers, and Chief of Water Regulations for the Wisconsin Department of Natural Resources; Mr. Langdon Marsh, Executive Deputy Commissioner, New York State Department of Environmental Conservation, also representing the National Governors Association; Mr. Mark Latch, Division Director, Florida Department of Environmental Protection; and Mr. Ken Bierly, Wetlands Program Manager, Oregon Division of State Lands.

Gentlemen, I appreciate your participation today and I appreciate your patience. First, Mr. Hausmann.

STATEMENT OF SCOTT HAUSMANN, CHAIRMAN, ASSOCIATION OF STATE WETLAND MANAGERS, AND CHIEF, WATER REGULATION, WISCONSIN DEPARTMENT OF NATURAL RESOURCES

Mr. HAUSMANN. Thank you for the opportunity to present the following comments on behalf of the Association of State Wetland Managers and the Wisconsin Department of Natural Resources.

The Association of State Wetlands is an organization comprised of professionals from local, State and Federal agencies and private consultants which has as its primary interest the protection and wise management of the Nation's wetlands. Our comments and recommendations are based on over 16 studies, workshops and symposia conducted by the Association since 1989 which collectively involve several thousand State and local wetland managers, wetland scientists, Federal agency staff, developers and other participants.

Wisconsin has a well-founded reputation and tradition of environmental protection. Wisconsin has strongly supported the Clean Water Act and the section 404 Program believing the program complements our State and local regulations and provides comprehensive protection to Wisconsin and the Nation's valuable water resources.

We believe that Senate bill 1304 is the first serious bill to build upon and address deficiencies in the section 404 Program. The bill will do much to implement the recommendations of the National Governors Association and the concepts put forth by the Association. It is also consistent with the ideas and recommendations of the scientific and technical communities which we represent.

Both the Association and Wisconsin strongly support wetland protection and restoration. However, we have also recognized that wetland protection and restoration require the understanding and the support of public and private landowners and the protection of the quality and quantity of water supplies of wetlands through watershed approaches.

We recognize that the bill raises issues with the environmental community with regard to general permits, enhanced State and local roles, advanced planning, prior converted wetlands, mitigation banks, and perhaps other matters. We believe that these topics must be approached with great care but we also believe that after 21 years with the section 404 Program which really does not protect many wetlands, it is time to try some new partnership approaches and to better address landowner needs. These are keys to actual protection and restoration of wetland ecosystems.

Today, in addition to providing general support for 1304, I'd like to briefly address seven areas of this legislation and close with some thoughts on wetlands, this bill and flood damage reduction.

First, the specific authorization for State and local programmatic general permits clarifies uncertainties about general permits under current regulations. The Association strongly supports the use of programmatic permits where the State or local program meets or exceeds Federal regulatory standards. My State, Wisconsin, is now

entering into its eleventh year with the State program general permit.

Second, State conservation plans as proposed is a very positive, proactive approach that can initiate useful changes to managing wetland resources, especially when combined with wetlands and watershed management plans.

Third, for reasons discussed in a brief paper attached to this testimony, advanced planning in the watershed context of the sort encouraged by this bill is needed to help resolve many of the severe problems and conflicts in the protection and management of freshwater and estuary wetlands now facing the Federal agencies, States and local governments. Such planning is needed to meet private and public landowner and developer needs for more certainty, predictability, flexibility and lower costs in wetland regulation.

Fourth, while the Association supports timely decision making, the inadequacy of many of the permitting applications presently submitted raises some concerns on how this provision of the bill will be implemented. We would strongly recommend that language be added to make sure that the 90-day time clock does not start running until adequate information to assess the impact of the proposed actions is in hand.

I would add as the Senator from North Carolina has said, I would like to have my property looked at in person before a regulatory decision is made. You have to realize though that I'm from the State of Wisconsin and 6 months of the year, all you are going to see is a blanket of white stuff out there.

Fifth, we support the intent of the Agricultural activities section of the bill. However, we believe that the existing provisions for prior converted wetlands should be maintained. Also the ability of the Soil Conservation Service to carry out this mandate in terms of resources and expertise is questionable. Training of SCS at the county level is absolutely critical to make this provision work.

Sixth, the Association supports the requirements for the establishment, use, maintenance and oversight of mitigation banks relying on practical and scientifically sound methods. However, the bill does not, but should include the explicit sequencing language as now found in the 404(b)(1) guidelines and as recommended by the National Governors Association and this Association. This is critical for the appropriate use of mitigation banks. Also, we question the creation of wetlands as an effective mitigation technique.

Seventh, the funding mechanism provided in the bill includes section 104, 106, 205, 319 and 604. These funds have become increasingly competitive as they are used to support multiple Clean Water Act programs. Congress must be willing to financially support the excellent intentions of this bill.

The Association and the Association of State Floodplain Managers recently conducted the first of two meetings in St. Louis on post flood recovery and restoration of Mississippi River flood plains and wetlands. The second meeting will be September 27th to the 29th and I invite you and your staff to attend.

Many provisions of this bill—State wetland plans, watershed management plans, programmatic general permits, and mitigation banking—will be important tools to accelerate the restoration and protection of open wetland, bottom land, backwater, prior convert-

ed and flood plain areas important to water retention and release of floodwaters.

As an illustration, a 5 percent increase in riverine wetlands in Wisconsin and Minnesota would reduce the floodwaters to the south by 1.5 billion gallons a day or a 20 percent decrease in flow.

In summary, we believe this bill will help create an effective national wetland regulatory program that is integrated with other Clean Water Act goals and programs. It will achieve this by creating new Federal, State, and local partnerships to evaluate, plan and regulate wetlands on a watershed basis as part of broader water resources systems.

Thank you.

Senator GRAHAM. Thank you very much, Mr. Hausmann.

Mr. Marsh?

STATEMENT OF LANGDON MARSH, EXECUTIVE DEPUTY COMMISSIONER, NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

Mr. MARSH. Thank you, Mr. Chairman.

I've had the privilege of working with the National Governors' Association and was chair of the NGA staff working group that developed the wetlands policy endorsed by the governors in February 1992. I'm testifying today on behalf of the NGA and the State of New York.

I'd like to start by saying how pleased we are by the provisions of Senate 1304 and commend Senators Baucus and Chafee for drafting and introducing the bill. We are proud at NGA and in New York to have helped develop the recommendations that are reflected in this bill. We are also pleased that the policy recently released by the White House is consistent with the direction of this bill. With the administration and the Senate so closely aligned, we are optimistic that progress in wetlands protection can be made.

The governors have recommended that any wetland strategy incorporate five general principles. First, protection efforts should be coordinated to make the best use of scarce resources and minimize inconsistencies among Federal, State and local programs. Second, wetlands management should be integrated with other resource management programs such as flood control and nonpoint source pollution. Third, wetlands delineation criteria and policies should recognize significant regional variance in the resource.

Fourth, land use regulation is traditionally a State and local function and a wetlands regulatory program should be designed to facilitate State assumption.

Finally, the governors believe there should be recognition of the unique situation encountered by the State of Alaska as Senator Murkowski so eloquently testified.

As States, we are reassured that Congress recognizes that State and local governments can be partners and viable players in wetlands protection. States are better positioned than the Federal Government to provide program services. In addition, they can often respond to the regulated community in a more timely and predictable manner. Of course the abilities and interests of the 50 States and the thousands of localities vary considerably but States and

local governments should be encouraged to participate to the extent that they can.

We're aware that some parties to the debate are wary of stronger State and local involvement, fearing that a loss of wetlands protection will result. This will not be the case. We welcome a strong Federal framework and close cooperation to ensure a strong program, but it is likely that States and localities that choose to become involved will do so to strengthen protection or to improve the delivery of the program. Consistent Federal oversight will ensure that wetlands do not fall victim to local politics in the future.

We also welcome provisions of Senate 1304 that endorse programmatic general permits, support and fund State comprehensive wetlands conservation plans and regional watershed-based plans and ensure State representation on the Interagency Coordinating Team. I note, however, that the bill is silent on program assumption. While most of the problems with assumption are regulatory and not statutory, we strongly recommend authorizing full or partial program assumption. States should be permitted to assume discrete and clearly identifiable portions of the section 404 Program as they develop the capability to do so rather than requiring the entire program to be delegated at one time.

We're pleased to note that many provisions of Senate 1304 will decrease the conflict that has historically occurred between wetlands protection and agriculture. Provisions to increase coordination with the Secretary of Agriculture, for example, should prevent problems from occurring by considering the impact of new policies on agriculture early on. We support exempting from the definition of wetlands prior converted croplands and certain artificial wetlands created incidental to agriculture. We also support continuing the exemption for ongoing agricultural practices.

In addition, we're pleased that Congress has chosen to expand the wetlands reserve program supported by us and the White House policy to create a national cooperative wetlands restorative strategy. We recommend, however, that the restoration strategy complement and not replace the Wetlands Reserve Program.

Perhaps the types of provisions that will be most welcomed by the majority of the affected public will be those that provide for regulatory reform. NGA and we in New York have supported efforts to make the regulatory process fair, reasonable, and predictable, believing that the vast majority of the people prefer to comply with wetlands protection efforts if they can understand what is required and expected of them. We have recommended some of these changes in the past and are pleased that they appear in the bill. They include reasonable time lines for permit review, establishing an administrative appeals process, and supporting mitigation banking.

Senate 1304 also strengthens wetlands protection and endorses the no net loss goal, clarifies the definition of wetlands, expands the list of activities subject to jurisdiction under 404, and more clearly defines what is fill. We do believe that watershed-based planning for wetlands also will greatly enhance wetlands protection in the long term. My colleague from Oregon, Ken Bierly, will be speaking in more detail about watershed and local wetlands

planning but I want to express my strong support for these provisions in the bill.

I understand that local and regional wetlands planning has been characterized by some as an effort to weaken rather than strengthen wetlands protection. I cannot disagree more. Absent a context for wetlands decision making, we will continue to see cumulative losses and will not have the proper perspective for functional assessments and mitigation.

In spite of our enthusiasm for Senate 1304, we are disappointed that the bill does not contain explicit language governing sequencing of mitigation requirements. We believe it is critically important, first, always to avoid impacts to wetlands, then to minimize any impacts that cannot be avoided, and finally, to offset any remaining impacts through compensatory mitigation such as restoration or creation of wetlands.

Without an explicit declaration in the statute of these sequencing requirements, we fear that too often the process will jump to compensatory mitigation when in fact the impact may have been avoidable altogether.

We do believe some flexibility must be available which is best defined through watershed or regional plans but we strongly urge that sequencing be followed whenever possible.

In closing, I'd like to reiterate that we are encouraged by the similarities between Senate 1304 and the White House wetlands policy. I urge Congress and the administration to continue this cooperative approach and to aggressively seek to move wetlands protection forward out of the morass of conflict that has consumed it for the past several years.

On behalf of New York and the other States, we welcome the new spirit of cooperation and partnership with the States and look forward to helping deliver a stronger wetlands program.

Thank you.

Senator GRAHAM. Thank you very much, Mr. Marsh.

Mr. Latch?

**STATEMENT OF MARK LATCH, DIVISION DIRECTOR, FLORIDA
DEPARTMENT OF ENVIRONMENTAL PROTECTION**

Mr. LATCH. Good afternoon. My name is Mark Latch and I'm the Director of the Division of Water Management in Florida's newly created Department of Environmental Protection.

The Department is the lead State agency for permitting activities impacting waters and wetlands in the State. At the present time we are seriously considering State assumption of the Clean Water Act section 404 Permit Program. For these reasons, we are specifically and very specially interested in reauthorization of the Clean Water Act, especially the activities relating to section 404.

Florida has an extremely active wetlands permit program at the present time based on regulation of wetland impacts in the dredge and fill program and regulation of the management and storage of surface water. The authority of these two programs is split between my department and five regional water management districts.

Recently, we have entered into interagency agreements and there has been legislation that has resulted in the first steps

toward streamlining these regulatory programs into a single, decision making process and, in addition, developing a Statewide, single wetlands delineation methodology. The intent is when the streamlining process is completed, an applicant will deal with a single agency for all wetland permits required under State law.

To further the streamlining initiative, the State has requested and received funding from EPA to investigate the feasibility of assuming the section 404 Program. In the process, we are working on that grant to see whether or not we want to develop an assumption package.

However, based on the work that we have done to date under that grant, we have found that a State programmatic general permit may be a much more attractive alternative for the State than the assumption process. Given the current statutory restrictions that we have found in the Clean Water Act, it is just not possible for us to develop an assumption package for a comprehensive, statewide program such as Florida's.

An attempt to address some of these concerns and possibly to remove some of these impediments, we have proposed language to the Florida delegation to amend the Clean Water Act. The detailed language is contained in my written statement but I'll outline some of those things here.

One, there is currently a provision that specifies that certain waters are not assumable. In Florida's case, that's approximately 50 percent of the wetlands and waters. We would recommend that language be modified so that all waters in the State could be assumable.

There is another provision that restricts permits under an assumed program to a 5-year period. Currently, our program in the State allows for 25-year permits with 5-year reviews. The Corps of Engineers issues very similar permits. We would like to see an amendment that would allow this practice also to be done.

There is another provision in the Clean Water Act that requires all permits that are pending at the time an assumption is done to go immediately to the State taking the program. This means both complete applications and incomplete applications. We feel that would be an undue burden on the State at that point in time and cause much confusion both with the State and with the applicant. We think it should be changed so that the State could get those applications that are received after the date of assumption and the Corps would finish off the processing of those that they currently have in-house. In addition, we would recommend language clarifying that the Corps of Engineers would retain authority to administer and enforce the permits that they have issued.

Also, there is no provision under the existing statutory language for financial incentives for the State to assume the existing Federal program. Shifting costs of this program from the Federal budget to the State budget will undoubtedly result in a substantial reduction of Federal costs and an increase in State costs with no offsetting revenue. Therefore, we would recommend language that would allow grants to the State for at least the initial part of the start-up until this problem can be addressed.

These amendments would go a long way toward making assumption of the section 404 Program more attractive to Florida and

other States. Given the experience of Florida and other States that have considered assumption, we would suggest consideration be given to this language for clarifying the relationship between the Federal and Endangered Species protection statutes and the State-assumed section 404 Program.

Protection of the endangered species has a major emphasis under the existing Florida program. However, should we assume the section 404 Program, we are concerned that current Federal statutes and policies may result in excessive Federal agency coordination burden on the State with no increase in endangered species protection.

I thank you very much for the opportunity to comment on this. I'd be glad to take any questions. I have a more comprehensive version of my remarks that will be attached and you can get the specific language we are suggesting there.

Senator GRAHAM. Thank you very much, Mr. Latch.

For the benefit of the members of this panel as well as others who have or will testify today, full statements will be accepted for the record and if you would like to supplement your statement within the next 15 days, the record will remain open to do so.

Mr. Bierly?

**STATEMENT OF KEN BIERLY, WETLANDS PROGRAM MANAGER,
OREGON DIVISION OF STATE LANDS**

Mr. BIERLY. For the record, my name is Ken Bierly. I am Wetlands Program Manager for the State of Oregon, Division of State Lands.

It is a pleasure to be here before you with the opportunity to speak about regulation of wetlands under the Clean Water Act. I would like to bring a State perspective to this issue and my comments are based on more than 20 years of direct experience with the State program.

Oregon has had a State legislatively mandated permit program prior to the passage of the Clean Water Act in 1972. Our direct experience with a command and control approach to wetlands regulation might provide some insights as you deliberate on changing the structure of the Clean Water Act.

The first realization that came to us after some years is that a permit program does not protect wetlands. We need to be very clear about that. A permit program can protect some wetlands from some discharges, but it does not protect wetlands in the landscape. It cannot and does not look at which wetlands should be protected. It is entirely a reactive program.

Additionally, that inherent structure means that the Federal Government, under the Clean Water Act, reacts to someone's desire to place fill in a wetland somewhere in the universe. The program is structured around a reaction to someone else's desire to destroy a wetland. So the permit program is inherently defensive and it creates a defensive reaction because people typically don't indiscriminantly place fill for no reason, primarily because it is expensive to move dirt.

People have legitimate reasons for placing fill and it is for this reason that we feel that the planning approach, watershed man-

agement planning, or other forms of planning that provide a context for regulatory permitting is extremely important.

In preparing for these remarks, I reviewed the General Accounting Office's recent review of the 404 Program. They reported that Congress has increased funding for the Corps from \$55 million to \$86 million in the 4 years between 1988 and 1992. Even with that level of increase in Federal funding, the problems identified in 1988 which had to do with cumulative impacts, lack of tracking, et cetera have not been resolved. This is an issue where additional Federal funding is not necessarily the solution. I am convinced that there is a more fundamental problem. The problem that we faced in Oregon and that I see with the Federal program is that no matter how well you administer a permit program, it will not achieve broad-scaled wetland protection objectives unless the permit program is changed into an implementation mechanism for a broader wetland resource planning program.

You must additionally establish goals for the program and 1304 does clearly establish goals for the program. Senate 1304 takes important steps in recognizing these shortcomings of the permitting program. Section 3 provides explicit goals for the program that have been long needed and broadly discussed. Many people have agreed upon the explicit goals stated for the program.

Section 12 allows wetland and watershed management plans to be developed to provide a context for the 404 permitting. I believe that the wetlands and watershed management planning aspect of this bill is a necessary element of the program. It provides the opportunity for local communities to be empowered to define solutions within Federal guidelines to solve problems locally. I think it is important that we understand that bottom-up approaches will be inherently longer lasting, more durable and quite likely be more creative than top-down approaches.

S. 1304 starts to address the need for partnerships. In sections 3, 4, 7 and 12, partnerships with State, local government, private property owners, and other individuals are addressed. This is a breath of fresh air. The partnership approach, I am personally convinced, has much power within a defined framework.

S. 1304 also explicitly addresses the need to integrate the Clean Water Act Program with agricultural programs, particularly sections 7 and 8. The lack of Clean Water Act recognition of SCS/USFWS minimal effects determination has been a plague that is being addressed in S. 1304. The integration and explicit recognition of the need to integrate the Department of Agriculture programs under the "Swampbuster" provisions of the Food Security Act with Clean Water Act programs is a very clear need.

EPA's recent brochure on how 404 affects farmlands is a useful piece of public information that should be emulated. In Oregon, \$3 billion annually is generated by our agricultural economy, so in the agricultural sector of the community, it is extremely important to maintain their productivity as well as maintain protection of wetlands.

I would also like to talk to you about another approach that is important to us in Oregon and throughout the west. I think it's important that nearly 100 years ago, Captain John Wesley Powell was before this body and indicated that watersheds were where it's

at, all water ends up, comes from a watershed and goes through the watershed. We must look at water and water resources within their natural context.

Unfortunately, we failed to listen to John Wesley Powell when he was director of the U.S. Geologic Survey and recommended that county boundaries be structured around watersheds. We have local government boundaries and State boundaries that run across watersheds and are trying to treat water as if it were pork bellies or other things that could be traded on the open market. We're starting to realize that we can no longer do that. If we look at how the wetlands fit within the watershed, we may be able to develop priorities for those wetlands that make sense to local people and the Federal Government.

I've provided detailed comments in my written testimony and would be glad to answer any questions.

Thank you.

Senator GRAHAM. Thank you very much, sir.

Mr. Hausmann, you talked about the fact that one of the positive features in this legislation was the concept of State conservation plans. That sounded very much like some of the comments that were made later about the desire to shift this program from being a reactive permit program to something that was more futuristic and positive in its orientation. Could you elaborate on your feelings of that? In light of some comments made by an earlier panel where there was stated resistance to the concept of classifying wetlands, would that not be an inherent part of a State conservation plan?

Mr. HAUSMANN. Let me approach the classification portion of that question first. Classification is something that we're doing every day. I run a permit program, Mark Latch runs a permit program. Every day in effect, we are making a value judgment. We are classifying a wetland; we are saying yes, this is something that we believe we can issue a permit to allow a wetland to be altered in some form or manner. So is there classification, are there value judgments going on? Yes, there are.

However, if you asked me could I implement some type of classification scheme and mapping for the State of Wisconsin, I would tell you there is not enough time or money in this world to do it. To do it on a national basis would be even more of a nightmare.

Having said that I have very negative feelings, obviously, about classification and trying to do it on a State basis or a national basis, I do believe that we do need to do it in certain problem areas within every State. That's what I look at wetlands conservation plans or watershed plans to be able to do, to look at areas that we can handle with existing staff and expertise that we have and I'm particularly thinking of those trouble areas, those areas that either have some unique natural feature that makes them hard to interpret or hard to deal with. In Wisconsin, we have what we call red clay areas. The soil is red clay, nothing percolates through it so everything on top of it by hydrology and plant species is wetland. We also happen to have a major port city of the United States, Duluth-Superior, sitting in this landscape.

Issuing permits on an individual basis there is a very difficult and contentious task. We are now in the process of doing a watershed plan which is identifying and classifying wetland areas that

are up for development, in the next 10 years, and making the permit decisions ahead of time, and determining what is going to be required in that area. So that's one area where classification can be done.

The other place I think that it can be done is where you are having development pressures, areas that are rapidly developing. Those areas can be done in the watershed plan or a watershed context. They can combine Federal, State and local interests and private and public interests into a plan.

The process of trying to classify wetlands on a State or a national basis, I'd look at as an impossible task but in a watershed plan or a local plan context I think it's very, very capable of being done and it is something that we have to do. It is a much needed direction.

Senator GRAHAM. The question that has concerned me is whether it is wise policy to have the Federal jurisdiction over wetlands be defined as the totality of wetlands or the full reach of the Federal Government's constitutional capacity. It has been suggested elsewhere that there should be a clear demarkation between the Federal jurisdiction and then with States having the responsibility to decide how to regulate those wetlands which were beyond the Federal jurisdiction.

I'd like any comments that any of you might have on whether there should be a single Federal jurisdiction that is all inclusive or some dividing of the wetlands?

Mr. MARSH. I'd like to take a crack at that. I believe that it is important to have a strong Federal framework for the wetlands management in this country. Because we did not do as John Wesley Powell suggested and organize ourselves along watersheds as opposed to artificial boundaries, we do have a problem of inter-jurisdictional management of resources that are common resources. I think having a strong and comprehensive Federal framework for resource protection, in this case wetlands, makes a great deal of sense.

However, I believe and we have testified I think fairly uniformly here that we would like to see as much as possible that the mechanics and implementation of that Federal authority be delegated to, assumed by the States to the extent that we have the capacity and resources to do so, and that will allow us to have the flexibility through these regional and regional watershed planning mechanisms as well as the comprehensiveness that resource requires.

Senator GRAHAM. Any other comments to my question? This will be my last question for this round.

Mr. HAUSMANN. If I may interject briefly, it's my understanding that Congress debated that very issue in 1977 when there was questions about the extent of what constituted navigable waters and there was a bill from I believe a gentleman from Texas who indicated that the regulation at the Federal interest was limited to traditionally navigable waters. The balance there was States would assume those other waters at that point in time.

Senator GRAHAM. I am prepared to accept the argument that the Federal Government has a constitutional reach that is broad enough to encompass virtually all wetlands in the United States. I'm really asking a different question which is the wisdom of utili-

zation of that reach. Mr. Marsh I think made some persuasive arguments as to why it is wise to have the maximum Federal jurisdiction. Would anyone else like to comment on that as a matter of wisdom rather than law?

If not, Senator Faircloth?

Senator FAIRCLOTH. I would totally agree with what you're saying, turn the inspection over to the States and allow them to have some authority to do it. I see a problem with that. I don't remember in my lifetime a Federal agency ever reducing itself or giving up jurisdiction. I missed it if one ever did. So if you put the States in charge, you're still going to have the Feds sitting there, so you're adding another layer of bureaucracy to take your permitting process through. That is what I'm afraid would happen.

I notice that Mr. Latch said that the Feds should fund it. Did I understand what you said?

Mr. LATCH. No, sir, not in totality. I don't ever see that happening. What I'm saying is that right now, for most States to even consider it, they are going to need something to give them a jump start, at least in the initial phases as they go into the transition.

Senator FAIRCLOTH. Do you think they are going to reduce their program to jump start yours?

Mr. LATCH. I agree with you, sir, I've never seen anyone reduce, so it's probably not realistic.

Senator FAIRCLOTH. You think we need more spending?

Mr. LATCH. I'm just saying there needs to be some incentive for the States to take it. At the present time, there isn't much of one.

Senator FAIRCLOTH. Where would you suggest we get the money?

Mr. LATCH. I don't know that I have any real good ideas for that, sir.

Senator FAIRCLOTH. Mr. Bierly, you said that the permit is a reaction, not a good system. In a word, what would you replace the permit system with?

Mr. BIERLY. It would be difficult to replace it in a word.

Senator FAIRCLOTH. Just a very few words.

Mr. BIERLY. The system that I anticipate is that the permit is an implementation instrument. It implements someone's idea of how you get from A to B. What we see as an appropriate governmental structure would be a planning mechanism done by local communities that integrates wetlands within the infrastructure of the community and then the permit becomes the implementation mechanism once the plan identifies what areas would be filled, what areas would be restored, so there would be predictability in the system and you would have a very good idea of what the outcome of a permit system would be before you even enter it.

Senator FAIRCLOTH. In a word, would that not be total assumption of private property rights?

Mr. BIERLY. No.

Senator FAIRCLOTH. What would it be?

Mr. BIERLY. In fact, our experience in Oregon is that what it would do is allow the voices of private property individuals more control over the establishment of community goals and assignment of direction for their future. My experience has been that the people who own property have a very strong role in making sure that those goals are achievable and realistic.

Senator FAIRCLOTH. The interpretation I usually get of things when we start dealing in individual personal property rights and community goals, that closely becomes the taking of personal property.

I thank you.

Mr. HAUSMANN. Senator, can I add a comment? You asked for an assumed program where you might get money?

Senator FAIRCLOTH. Yes.

Mr. HAUSMANN. This is just an idea and I've never seen an agency give up things either, including my own, but it certainly makes sense to me that if my State were to assume the permitting program from the Corps of Engineers, that some portion, some percentage of the money that they use to run that program in a State could be given to that State to run that program at least on a seed basis until the State legislature acts to fund the program.

For example, the Corps of Engineers spends close to \$2 million a year to run the program in the State of Wisconsin. I can guarantee you that if there was an offer of 50 percent of it, \$1 million, my legislature would probably be giving me directions to assume the program from the Federal Government.

We did a study of the feasibility of assuring the S. 404 program in Wisconsin, completed in 1990, and the one major reason that we did not go ahead and assume the section 404 Permit Program was lack of funding. Every other Clean Water Act Program that the State of Wisconsin has taken on has come with funding, including the Discharge Permit Program, Nonpoint, et cetera. The only assumable program that does not have any funding, other than study grants, is the section 404 Clean Water program.

Senator FAIRCLOTH. I can give you the Corps of Engineers' answer now. We are underfunded as it is. Our programs have been cut, our budget has been cut. We hardly can survive. We would be glad to give some authority to the State of Wisconsin but no money.

Mr. HAUSMANN. I've heard that answer already from the Corps.

Senator GRAHAM. Mr. Latch, you talked about the similarities or differences between an assumption program and the programmatic general permit program. Could you elaborate on what are the practical differences or similarities between those two and why you feel the general permit might be a preferable way for a State to move into this area?

Mr. LATCH. The biggest problem right now is that you can only assume, as I said in my prepared remarks, about 50 percent of the program. In Florida, we would only be able to assume isolated wetlands, headwater wetlands. We would not be able to assume any permitting authority in rivers, major lakes or the coastal areas.

Senator GRAHAM. Is that because the 404 regulations restrict assumption?

Mr. LATCH. That is correct. It says that you cannot assume navigable waters, any waters that are susceptible to navigation or can be made to be navigable with improvements. There's some real funny language on it. In Florida, as you know, that's most of our State in large part; that's probably 50 percent or more of our permitting load. So then you have a fragmented program right there.

Under the State programmatic general permit, you negotiate with the Corps of Engineers for taking over whatever portion you want. It's a lot more open-ended. We've opened discussions with the Jacksonville office of the Corps and we're proceeding under that guise.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. What is navigable water?

Mr. LATCH. That's one of the questions and the Corps makes that decision. They have to tell us what it is and that's another problem that you get into with defining where the navigability stops in the river. So you have to undergo these real extensive studies to find where the St. Johns River is no longer navigable. It becomes a morass that I just frankly cannot recommend—

Senator FAIRCLOTH. I'm not talking about the St. Johns River, I'm talking about the St. Lucy Canal and everything else. That's navigable water.

Mr. LATCH. We would presume so but the Corps would have to tell us that.

Senator FAIRCLOTH. In other words, it is all navigable water?

Mr. LATCH. Up to where you probably can't take canoes and things like that. It just depends upon how they define it and how they want to get out and do their studies. So, like I said, it becomes a nightmare trying to make that distinction.

Senator FAIRCLOTH. You're in charge of the water division in the Department of Environmental Protection?

Mr. LATCH. Right.

Senator FAIRCLOTH. And you don't know of a stream, you can't even identify a ditch that isn't navigable water in the State of Florida?

Mr. LATCH. Sir, you asked me what I thought was navigable and I don't have a good definition for that.

Senator FAIRCLOTH. All right.

Senator GRAHAM. Several of you have identified the principal restraints on greater State assumption of responsibility whether it be through a delegation or through general permits, et cetera. How well do you feel the legislation that has been introduced would deal with the mitigation of those restraints on State assumption? If the legislation that Senators Baucus and Chafee have written were to be the law today, how would that affect your recommendation to your State as to whether it should assume the program?

Mr. MARSH. As I testified, Senator, I think the one area of improvement that I would see would be the spelling out that a partial assumption could take place of either geographic area or a part of the program in terms of certain types of wetlands or some other partial assumption that would be commensurate with the ability of the State and its resources to do the job well.

I think there also needs to be some attention paid to some of the issues that Mr. Latch has raised in order to make sure that assumption could be as broad as possible. What we're pushing for is to make it as easy and as effective to transfer that first line authority from the Federal Government to the States as possible, commensurate with a firm Federal oversight to make sure that all the States are doing it equally well.

Senator GRAHAM. Let me ask one follow-up question relative to that oversight. One of the criticisms that I think has come from the State of Michigan which I believe is the only State that has assumed is that oversight is on a case-by-case basis, so you are in the situation that you're always subject to Monday morning quarterback on each individual permit. Is that an accurate description of that? If that is accurate as to what the current oversight is, how would you suggest the oversight ought to be?

Mr. MARSH. This is an ongoing concern of States with Federal oversight in a variety of programs and generally what States prefer and we would prefer in this case as well, is that the oversight be of the effectiveness of the program to undertake and accomplish the objectives of the program and have a review or post-audit or something of that nature to make sure that the permits that have been issued are consistent with the terms of the assumption or the State program general permit or whatever the mechanism is, and that be reviewed on a periodic basis and a decision then made whether to continue the delegation or assumption, withdraw it in part or take some other action which might include, for a period of time, permit by permit review until the State could again demonstrate that it was doing the job correctly.

As the baseline type of review, we'd prefer a much more stand-offish one that looked at the general accomplishment and effectiveness of the program.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. I have just a brief and somewhat theoretical question. Particularly Mr. Latch and the State of Florida, I'm not as familiar with some of the others, all of you have people sitting on land that are paying heavy ad valorem taxes on it with the assumption that it has some intrinsic value and that they have property rights to it. Is this not right, they are paying pretty heavy ad valorem taxes on it? At what point, when they ask for a determination of whether it's wetlands or not, or if they ask for this determination in view of an inheritance or in view of a advantageous sale to a child or whatever, they ask for this review and you declare it wetlands, they might encourage you to declare it wetlands, then it's value drops from what it is on the tax books at from \$4,000, \$5,000 to \$10,000 an acre, whatever it might be whether it's in Sumter, Hardee, or Palm Beach, to \$50 an acre because it's worthless. If you declare it wetlands, what good is it? What can they do with it? Maybe it's growing trees but that's probably likely Australian pine or whatever. So it's worthless. How does the county cope with that loss of ad valorem tax when that is, in the case of 99 percent of the counties in the country, the principal source of income?

Mr. LATCH. Senator, you've identified one of the major problems that we've been wrangling with in large portions of the State, especially in some of the counties that you were talking about—Palm Beach, Dade, Broward County—where a lot of the land that hasn't been developed is in fact wetlands.

We've been working with the Corps of Engineers, EPA and some other areas to do the advanced identifications and to try to identify areas that can be developed, to identify wetlands that can be impacted and we are in the process right now of trying to establish mitigation banks even within these areas to work with these areas

to identify areas that can be developed, those that if they are developed, we'll work to figure out some way to mitigate under the Federal and the State policy. So it's a very difficult situation as you said and there isn't an easy solution that we have found. We are trying to work with the counties, with the cities and with the landowners to try to figure a way around this.

Senator FAIRCLOTH. If I owned land in Palm Beach or Broward County today, I'd call you tomorrow and tell you to come identify it as wetlands. I'd sell it on an advantageous sale to my child at \$50 an acre and hoped the law changed and some common sense came back into the policy a few years down the road.

Mr. MARSH. Senator, I think you're getting indirectly at the question of taking. I just wanted to clarify that the governors have wrestled with this in their statement.

Senator FAIRCLOTH. They wrestled with it. Who won?

Mr. MARSH. I think everybody wins because we have a long tradition in our country of being able to take these kinds of questions where there is a potential diminution of value to the point of no value at all, to the courts and to get a judgment as to whether or not a taking has taken place. That has been the consistent result in our State. We have not had those kinds of problems, although we've had a wetlands statute on the books now for nearly 20 years, with a direction that says that the local assessor must take the burden of the wetlands' regulation into account in making an assessment. We have not had those kinds of problems that you mentioned. In fact, there have been a few cases where the landowner has been able to demonstrate that the burden of the wetlands regulation is such that it constituted a taking. So there is a mechanism in place, we believe, and the governors agreed with that to handle these kinds of extreme situations.

Senator FAIRCLOTH. You're talking extreme situations, I'm talking about ordinary situations. Have you hired any lawyers lately?

Mr. MARSH. Yes.

Senator FAIRCLOTH. It took your salary to pay them, didn't it if you had anything more than a speeding ticket. How many ordinary, small landowners, citizens, farmers, do you think have the resources to hire a legal firm, an engineer, MIA appraisers, hydrologists, to prepare a case to present against the plethora of Federal agencies, plus the U.S. attorneys with unlimited governmental funds, to fight that or take a case to court? How many people do you know? BP can, but the average property owner is devastated. He doesn't have a prayer or a chance to bring it and not only that, if he wins, the amount of the reward he might receive, although the government loses and he wins, is consumed by the preparation of the case in his attorneys' fees. Certainly in the case of him winning and the government losing, they should have paid the cost of his suit. Would you recommend that as a Federal policy, that if in the case of a suit the Federal Government loses, they pay the attorney fees?

Mr. MARSH. I think it is the case in some circumstances. I'm not sure I would recommend it in all.

Senator FAIRCLOTH. Tell me which ones you'd recommend it.

Mr. MARSH. I think in cases where there is clear government oppression.

Senator FAIRCLOTH. How do you know it's a clear government oppression? A lot of people think the whole wetlands issue is government oppression.

Mr. MARSH. It's up to the courts to decide that too.

Senator FAIRCLOTH. Thank you.

Senator GRAHAM. Gentlemen, thank you very much. This has been a very instructive discussion and I appreciate your bringing the State perspective to bear on this issue.

Thank you very much.

Panel six consists of Mr. Bob Szabo, Executive Director, National Wetlands Coalition; Mr. Dean R. Kleckner, President, American Farm Bureau Federation; Dr. Doug Inkley, Director, Biodiversity Conservation Division, National Wildlife Federation; Mr. Ted R. Brown, Vice President and General Counsel, Arvida Company; Mr. Kevin Martin, President, Soil and Environmental Services, Inc.; and Mr. Dan James, Federal Affairs Representative, Pacific Northwest Waterways Association.

Gentlemen, we appreciate your participation in our hearing today. As I indicated to the previous panel, any statement that you would like to supplement for the record will be received and the record will stay open for 15 days after today's hearings.

Mr. Szabo?

STATEMENT OF ROBERT SZABO, COUNSEL, THE NATIONAL WETLANDS COALITION

Mr. SZABO. Mr. Chairman, thank you for letting us appear today. I am in fact the counsel to the Coalition and not the executive director.

The Coalition is a cross-section of the regulated community that is affected by this program. I won't go through the litany of the importance of wetlands. That has been pointed out to you and we agree that wetlands are very important. However, we also agree that this is a difficult program for several reasons.

First, I think the program evolved more than it was designed by Congress. Second, more often than not, in fact the Fish and Wildlife Service says 75 percent of the time, the program regulates privately owned property. Because of that fact, there is an incredible dilemma that Senator Faircloth and you have gotten into with previous panels.

I was pleased to hear Senator Faircloth point out that not only does this affect the rights of the landowner but it also affects the very way we fund our local governments, our schools, and so forth. In my home State of Louisiana, when your land is designated as a wetland, the value drops to about 20 percent of its predesignation value. So the program has a significant impact on local tax bases.

I'm particularly pleased that you have agreed to address this issue in the Clean Water Act, that you are asking the kind of questions that you just asked, that Senators Baucus and Chafee have put in a bill that we think is a step in the right direction. We think the President's plan is a further step in the right direction, but we think some more needs to be done and should be done as you ask the kinds of questions you are asking about what Federal policy should be with respect to wetland.

We support the Hayes bill in the House as the best approach and continue to believe that it has many things in it that are very important to this program.

Let me cut to an issue that hasn't been discussed very much. We think the crux of the problem today is the concept called sequencing, that the rigidity of the sequencing program on primarily private property in this country has created the reaction that has brought this issue to your attention and forced Congress to look at this issue.

We think the concepts of sequencing, categorization of wetlands, and restoration, if applied properly, provide the way out of this dilemma and can provide a way to both conserve the wetland resources of the Nation and also to relieve some of the pressure and the conflict between private landowners and the regulatory system.

Sequencing evolved. It was adopted first by regulation by the EPA and then by memorandum of agreement between the EPA and the Corps. Sequencing requires that to get a permit I must first prove that I cannot avoid the wetland in question, I have no other place to go with my activity. Second, if I can get past that step, then I must minimize my impacts. Finally, I must mitigate those impacts that aren't avoidable. Sequencing has turned the wetland equality program into a program that attempts to avoid economic activity on private property and that's why the reaction has been the way it has been toward Congress about this program.

We believe that classification of wetlands, albeit a difficult task and a big task, is a way to try to prioritize the attention of the Government on the most important wetlands and maybe add a little flexibility on the less important wetlands to try to relieve some of the pressure on the program.

We think that classification by functions in the State watershed plans is a good first step, if the States will do it, but we still think classification is necessary on the full Federal plan. The President said it's not achievable and feasible, but we note two things. The Government is talking about becoming more customer friendly. Nothing could be more customer friendly telling American citizens how their property is going to be treated. This is a very customer friendly idea in line with the reinventing government initiative.

Second, we note that the Congress, without having authorized it, has appropriated \$160 million-plus for the National Biological Survey, which is set to begin next month. This program is not going to map just the wetlands of the country but all the land of the country by its biological diversity. That seems to us to be an even bigger undertaking than mapping the private lands that are already regulated at the Federal level. In fact, we also understand that the first task of the National Biological Survey is to complete the wetlands inventory that has been begun by the Fish and Wildlife Service.

So if these things are true, it seems that the Government does have the money perhaps to try to help the private sector by mapping the wetlands so that there is some notice; classifying wetlands; and then adjusting the rigidity of Federal regulation based on the importance of the wetland value involved.

Again, we like the watershed management approach, we like the programmatic permitting approach, but there is no assurance that this will happen at the State level.

Restoration is a key issue. The private sector can be part of a restoration program. A lot of the wetlands in this Nation have been converted from wetland and can be converted back to wetlands. Mitigation banking is an important tool in that effort. We would suggest, however, that you not limit mitigation banking to just restoration of wetlands. Certainly creation of wetland is possible in certain circumstances. There are many instances of mining reclamation that has turned uplands into wetlands, where environmental awards were given for that achievement. We think that the Congress should take cognizance of this achievement as the President's program has.

We also believe that if Congress wants these mitigation banks to be private sector banks that are funded by the private sector, Congress might want to go a little easy on the notion that they have to be created in advance of their use. Perhaps they can be created contemporaneously with their use when there is normally an incentive to create the bank. Clearly, they need to be examined, to be monitored, to be enforced when they are not working properly, but we think they are an important tool.

Mr. Chairman, you raise a very good question about the extent of waters of the United States. We believe that for now the 1987 guidelines for identifying wetlands are probably the best wetlands identification tool that can be done at this point. We would encourage the Congress to provide that, when more information is available, if Congress thinks the definition is not correct, then Congress should legislate that definition rather than change the definition through a rulemaking. This is a fundamental jurisdictional decision by the Congress of whether the Federal Government should be regulating in this area and we think Congress should make that decision as elected officials.

We agree with the extra activities that should be regulated—drainage, excavation, channelization. If you're going to have a wetlands program, then Congress need to regulate the activities.

There are some things about the program implementation that I'd like to talk about very briefly. Senators Baucus and Chafee make strides on the 404(c) veto provision of the EPA. It's very clear to us now that the EPA and the Corps are in concert in this program, that they are working together, that the EPA's voice is being heard. Then we would invite Congress to consider doing away with that veto. The veto is a very unique mechanism in government. It is a back-end mechanism and perhaps the time has come to get rid of that mechanism. So we would invite Congress to take one more step than has been taken in the Baucus-Chafee bill.

The administrative appeal is a good provision. We prefer the President's approach which limits the administrative appeal to the landowner who has been denied a permit or who has other difficulties. The environmental groups and others can participate in a judicial appeal. There are many agencies involved to represent the public; the question is, does the landowner have an appeal. So we prefer the President's approach to the Baucus-Chafee bill approach.

Deadlines for action are good but we ask you to include a "hammer" on the deadline. If the permit hasn't been issued, then it should be deemed to have been issued. There is no hammer today in the law. Ninety days for action is what is required often today and if something doesn't happen automatically, Congress perhaps will not have made the strides Congress would like to make.

General permits are good things and we are pleased that the President's plan nor the Baucus/Chafee bill has changed general permits.

One comment about the role of government and the one comment about private property rights. We like what the bill and the President have done with regret to the role of the State and local governments. If Congress you wants it to work properly when these other programs have been set up, then you must get the Federal Government out of the program. There is no reason to have the Federal Government look over the shoulder of the State and second guess their permit judgments. If the State proves not to be acting properly, then the Federal Government can move back into the program, but while there is a State and local program, remove the Federal government or else we will end up with two programs, not one program, and Congress will have made no great stride forward.

Finally, the issue of private property rights. We all recognize these rights and we know they are important. This program directly affects these rights. It is not enough, we think, to say if you have a problem, go to court. For a person to go to court against the Government is probably a \$200,000 or \$300,000 legal fee kind of burden; it's a 5- or 10-year period of time. The Federal Government will pay if they lose—that's what the law says—but who can carry the case while it's ongoing?

We would recommend that you create some mechanism for at least some classes of people to get compensation when they have had takings occur. Secretary Babbitt has suggested in a hearing on the House side that the Land and Water Conservation Fund might be used for this purpose. We think that's an interesting idea that bears some examination. But to say Americans are protected because they have the right to go to court is often to say that only rich Americans and corporations are protected.

Thank you for your efforts in this issue, Mr. Chairman. We look forward to working with you toward a resolution of this issue.

Senator GRAHAM. Thank you very much, Mr. Szabo.

Mr. Kleckner?

STATEMENT OF DEAN R. KLECKNER, PRESIDENT, AMERICAN FARM BUREAU FEDERATION

Mr. KLECKNER. Thank you, Chairman.

I'm Dean Kleckner. I'm a hog, soybean, corn farmer from Iowa and I'm President of the American Farm Bureau. I want to thank you for holding these hearings that you've been holding and this one, and the one coming up next week in Montana.

The Farm Bureau has made the Clean Water Act, especially the wetlands part of it, our number one priority issue. Our board of directors did that. Senator Graham, Mr. Loop in your State, and Mr. Jenkins in your State, Senator Faircloth, are on our board of direc-

tors and helped to make that decision. It's a number one priority for us.

My comments today are focused on the issue of wetlands policy. I've submitted a statement and I'm going to make a few comments based on my statement that you have.

To America's farmers and ranches, wetlands policy became an all too familiar issue in recent years, more than we want to know about it we've been hearing. It was in large part triggered by the 1989 Wetlands Delineation Manual and while the expansive part of that manual in 1989 was a key concern, it quickly became apparent that there were other fundamental concerns that we had to deal with if we were going to have a fair wetland policy in this country.

To help put it into some perspective, farmers and ranchers are generally long-term landowners whose primary asset and source of capital is the land itself as opposed to the concerns of short-term landowners whose primary interest is just kind of navigating the 404 Permit Program, winding their way through that. We're long-term and we have to live with this forever.

We're especially concerned with the negative effect of wetland regulation on property values and property rights and believe strongly you need to address this as a committee. Already, in the short time I've been here, I've heard comments on that in your questions.

Regarding the two proposals at hand, we are pleased that several of the key issues of concern to agriculture have been raised, but are troubled that they don't go far enough to solve the problem. For instance, the Farm Bureau agrees with both the Baucus-Chafee bill and the President's proposal that prior converted cropland should be excluded, but both proposals limit the exclusion to the production of annual crops, thereby we think unintentionally excluding perennial crops like hay and fruit trees, for example. They are not included. I think unintentionally, I hope unintentionally and is one that you could rectify easily.

We recommend the exclusion for prior converted cropland similarly apply to all land regardless of the type of crop produced. On a related matter, we recommend that farmed wetlands that are so dry that you crop them virtually every year also be given prior converted status.

We're supportive of the concept first raised in S. 824 by Senators Bond and McConnell and that were continued in the President's proposal that would consolidate all wetlands delineation authority for agricultural land within the USDA. That is the concept of one-stop shopping and I know that's been mentioned also earlier today. We support it.

We also agree with the need for an informal appeals process for permit denials as well as wetland delineations. We would recommend also that this be subject to judicial review as well. Combined with the proposals for certification and training of wetlands delineators, we believe that it will have the effect of forcing integrity and better decision making on down through the system.

We are in favor of strengthening the normal farming and ranching exemptions in section 404(f) and we're generally pleased with the direction of both proposals but we think the committee may wish to explore additional changes there to ensure that the exemp-

tion works as intended. An example might be the recent Tolloch decision regarding the regulation of mechanized landclearing. A lot of farmers in my State of Iowa and other States that tear out a fence now and then and take in their bush hog and tear up the fence, the shrubbery that's been growing in the fence might have been there 40 years, so is that going to be allowed? It ought to be but the Tolloch decision, I wonder about it.

Classification of wetlands is another reform that we believe should be included in this legislation. We strongly believe that wetlands functions and values vary considerably and that a successful and fair wetland policy must take that into consideration. Wetland categorization is not only possible, it is an essential ingredient in a reform effort.

I agree with what Mr. Szabo said, we're going to spend apparently \$160 million or something on the National Biological Survey, so I don't really soak up many of the crocodile tears that cried about we can't afford to do wetland categorization.

Finally, we come to the issue of private property rights. Essential to the debate—Senator Faircloth, you raised it here a moment ago in your questions also—it's a primary reason that wetland policy is so contentious. Landowners around the country believe that the current regulatory program is restricting the use of their property and adversely affecting property values.

We were pleased that the President's proposal speaks to this issue, including recognition of the need for compensation but regrettably the proposal is silent on how to resolve the problem. The current option available to a landowner of bringing action against the Federal Government in claims court is simply too expensive and too time-consuming for the average citizen to justify. They just can't afford it and can't afford the 6 or 8 years it is going to take to run it through the court.

If this remains the only vehicle for seeking redress, then most Americans will find themselves precluded from protection under one of the most basic constitutional rights. New ways simply must be found to enable the average landowner to obtain compensation for the lost use and value of property.

In conclusion, many of the reforms we have suggested previously, such as regulatory categorization, would provide some relief to the property rights concern of landowners. However, fundamentally, the Corps and the EPA must be directed to take into account the property rights concerns of landowners and be directed to minimize the adverse effect of their actions on the use and value of private property.

We thank you again for what you've been doing and appreciate your efforts. We look forward to working with you and I'll be happy to answer questions at the proper time.

Senator GRAHAM. Thank you very much, Mr. Kleckner.

Dr. Inkley?

**STATEMENT OF DOUGLAS B. INKLEY, DIRECTOR, BIODIVERSITY
CONSERVATION DIVISION, NATIONAL WILDLIFE FEDERATION**

Mr. INKLEY. Thank you, Senator Graham. I appreciate this opportunity to testify on behalf of the National Wildlife Federation.

You are not aware of it at this time, I know, but you were very much responsible for the career tract that I am currently on and end up sitting here today. I want to commend you for your efforts as Governor of the State of Florida to establish the State's Non-game Program. That was my first real job, working for the State of Florida's Nongame Program following my graduation and I ended up here today, so thank you.

Senator GRAHAM. I'm glad to know that we created at least one job.

[Laughter.]

Mr. INKLEY. You've created many more jobs than that, I can assure you of that, through that program.

I know that you and I would also much rather be in Florida today fishing as Florida is so famous for. I would point out that according to the National Fish and Wildlife Service statistics, there are hundreds of thousands of anglers in the State of Florida and over 100,000 angler days of fishing are occurring just today in Florida. So there's 100,000 people in Florida fishing, showing the importance of fishing and the wetlands resource.

While I'm testifying on behalf of the National Wildlife Federation today, I would be remiss not to mention that there is a clean water network which has been established and is comprised of over 400 organizations across the country. These groups are united in their effort to strengthen the Clean Water Act and especially wetlands protection as the Clean Water Act is reauthorized.

I feel somewhat like the Lone Ranger today being on this panel, however, I would point out there are dozens of other organizations that too wish they could testify today in behalf of wetlands protection.

The reason that I'm here and the National Wildlife Federation is interested in this issue is because we are deeply concerned about the fate of our Nation's wetlands. We recognize that they have many functions. One of those functions is flood control. Unfortunately, we have witnessed during the summer months extensive flooding that occurred in the central part of the country. Those floods were certainly unprecedented. Unfortunately, the flooding that occurred in the central part of the country was exacerbated by the loss of wetlands.

The result of that is we've had loss of human life, loss of private property values in those flooded areas, we've had businesses that have had to close, we've had peoples' homes flooded. So, indeed, wetlands loss has had an impact on the American public.

Another benefit of wetlands is storm surge abatement. One example is that Hurricane Andrew which blew ashore and reeked havoc in your own State unfortunately caused over \$20 billion in damage. When that hurricane blew into Louisiana with approximately the same strength, there was about \$2 billion in damage. There are many factors that contributed to the tenfold difference in damage in those two States. One of those factors is the fact there are extensive wetlands along the coast of Louisiana that helped to provide a buffer of protection.

Fish and wildlife habitat is an extremely important benefit of wetlands protection. Forty-three percent of the Nation's threatened

and endangered species are dependent upon wetlands at some stage of their life cycle.

Clean water, by providing clean water, we have much lower costs needed for water treatment plants to provide the drinking water for all of us. Groundwater recharge, 50 percent of our Nation is dependent upon groundwater. Wetlands are extremely important for recharging the groundwater and providing clean drinking water.

Finally, last but not least, is the economy and jobs. There is a \$55 billion annual commercial landing of fisheries in this country that helps employ over 1 million workers. In the 10 States represented by this subcommittee, there are provided over 235,000 jobs for people in the recreational fishing industry alone. There are over 36,000 commercial fishermen in these 10 States alone making a living that way, and over 14,000 jobs provided in fish processing plants.

That's the reason for the National Wildlife Federation being here today and being so interested in wetlands protection, because of all their functions, because of the values that they provide to every American citizen.

Let me briefly address the legislation and also the Clinton Administration's position which has recently been released. That is a lot to talk about. Senator Boxer's bill and Congressman Don Edwards' bill, both bills we strongly support. In the interest of time and brevity, I will not go into the details of those.

We perceive those bills to be balanced, fair approaches to helping address this problem of wetlands protection. I probably shouldn't let you in on this secret, but if you'll promise not to tell anyone, I will, and that is that when H.R. 350 and Senator Boxer's bill were written there was some consideration given to what the approach should be. Should the approach be to try to set the lefthand side of the debate and then work for a compromise or should the approach be to try to come out with something that is reasonable, fair and balanced? The secret is that we decided to do the latter and come out with something that is fair and balanced. So that is where we are coming from.

Another bill that I should mention is the Hayes bill introduced in the Senate last year by Senator Breaux, H.R. 1330. The National Wildlife Federation does not support this bill in any way. We believe it will tremendously increase the cost to the Federal Government of implementing the wetlands protection program and lead to accelerated wetlands loss.

We commend Senators Baucus and Chafee for their introduction of a wetlands bill. We appreciate their efforts to try to bring everybody to the table. We look forward to working with them. We are very pleased with certain aspects of their bill, but would like to work to strengthen their bill as well.

With respect to the administration, we are pleased with several portions of the administration's position. One is the withdrawal of the Alaska exemptions. Let me address the Alaska exemptions. I think Senator Murkowski's photos were very appropriate to show today because they did show through the oil and gas development which was in those photos can development can go ahead and move forward in Alaska. The fact of the matter is that 75 percent of the permits that were applied for in the last 20 years in Alaska were

granted. The fact of the matter is only 15 permits total in the last 20 years required mitigation requirements.

The Fish and Wildlife Federation is working for strengthening the wetlands protection at this time because of the current status of wetlands. Having lost more than 50 percent of this Nation's wetlands, we continue under the Clean Water Act as it is implemented today according to the latest Fish and Wildlife statistics, to lose 290,000 acres of wetlands a year.

If this Subcommittee on Clean Water, Fisheries and Wildlife is to fulfill its mission, as indicated by the name, then we must strengthen wetlands protection.

We look forward to working with the committee. Thank you for the opportunity to be here today.

Senator GRAHAM. Thank you, Dr. Inkley.

Mr. Brown?

STATEMENT OF TED BROWN, VICE PRESIDENT AND GENERAL COUNSEL, ARVIDA COMPANY

Mr. BROWN. Let me first make it clear that my appearance is not on behalf of my company but on behalf of a foundation which is comprised of approximately nine companies, while small in number, but nonetheless representing landholdings in 44 States of the United States.

We applaud initially the efforts evidenced by Senate bill 1304 and by the President's initiative, but I think we believe there is more that can be done to make the program more workable and more rationale.

First and foremost, I think it is important to point out something that I have not yet heard today in my sitting here and that is a clarification of the concept of no net loss. I believe everyone accepts the idea that no net loss is a goal to which we ought to aspire, but I note with interest and hope it was an oversight that there is no mention of no net loss of function and value which has been the touchstone of this process, at least up until this time and one which I believe is imperative, be it part of the process going forward, if we have any hope of achieving a net gain in the future.

Second, I'd like to talk briefly about administrative and judicial review. Senate 1304 as submitted provides for administrative review of a permit denial and suggests that you must go through that course of action prior to being able to proceed forward with judicial review. I would urge as you review this particular piece of legislation to give serious consideration to allowing a permit applicant who has had a permit denial to select either of those alternatives.

It occurs to me that after one has spent usually hundreds of thousands, and in some cases, maybe millions of dollars to get to the place where a permit denial has taken place, the applicant ought to have the ability to determine which of those two courses is more likely to generate a result he can live with. It may well be that the administrative review process affords an opportunity for compromise that would be more expeditious. So I think incorporating that into the bill is an important step.

On the other hand, the applicant may well perceive that the level of conflict that exists on his application has no prospect for compromise and in that instance, he ought not be forced as a condition to proceed to go to court to have to spend another 6 months, 9 months or a year in administrative review at that stage of the proceeding. So we would urge that on that particular aspect of the bill, either option ought to be available to the landowner or permit applicant.

The President has suggested an administrative review for jurisdictional delineation determinations and we applaud that initiative and ask that it be incorporated in any legislation which you might adopt. It is long overdue and it certainly will give rise to greater accountability within the system itself if those who are called upon to make delineations understand that they are subject to administrative review by independent personnel within the agencies.

Another subject which is frequently talked about and about which there seems to be some hesitancy to deal with is the notion of one agency controlling this process. In the President's remarks, he notes that he wishes to eliminate duplication, eliminate the contentiousness of the process and I would report to you that there is nothing more contentious and more duplicative than having to engage in the shuttle diplomacy that one engages in as you move back and forth between the offices of the EPA and the Corps of Engineers in an effort to achieve a permit.

The President interestingly enough, not in his direct remarks which he released, but in the questions and answers which accompanied those remarks, notes "The Administration is prepared to take steps to emphasize a single decision maker, to streamline the various Federal wetland programs and reduce duplication, overlap and delay." That ought to be the linchpin upon which this committee should go forward and give serious thought to consolidating the administration of this program in either the EPA or the Corps of Engineers.

If that is absolutely politically unworkable, let me suggest a compromise that I think would at least inure to the benefit of permit applicants in any event. It goes something like this. If an application is filed with the Corps of Engineers, the EPA would, and I'll arbitrarily pick a period of 60 days, make a determination that the application affects waters or wetlands of national significance and it would have the right to preempt the Corps at that point and take over the permitting responsibility.

If it makes that election, then the Corps of Engineers would simply become a commenting agency and the absolute prerogative for administering the permit would then be vested in the Environmental Protection Agency. On the other hand, if the EPA is not prepared to make that certification within the 60-day time frame, then the application would remain with the Corps of Engineers and the EPA would simply become a commenting agency with no right of a veto.

The effect of this is at least the permit applicant has at a particular point in time now knows it's dealing with one resource agency, one Federal permit decision maker. We think that is a way that would materially improve the effectiveness of the program

without disengaging either of those agencies if it is politically impossible to do so.

Last, I want to talk quickly about classification because a lot has been said about it but I think some points that need to be made have not been made.

Your bill 1304 does nothing with this idea. The President says that prior categorization ranking would not provide for consideration of individual impacts associated with specific projects and it would cost too much. The President also agrees and very importantly to two fundamental predicates that go right to the heart of classification. He acknowledges that not all wetlands are equal and he acknowledges that the process rigor should coincide with the value of the wetland that is being impacted.

We believe that is classification and that classification can be done but not across the whole country—I differ with Mr. Szabo a little bit on this. My view is that criteria ought to be developed on a watershed basis as we do the watershed analysis that we have been talking about and that at the time an applicant comes in to have a jurisdictional delineation of his property, he would simultaneously get a classification. Then the rigors of the permitting process that apply to that classification after that classification is in place would be adjusted to reflect whether it's a high, low or medium value wetland.

I notice my time is up. There are a few more observations I'd like to make about that but I want to be responsible to your rule.

Thank you very much, sir.

Senator GRAHAM. Thank you very much, Mr. Brown.

Mr. Martin?

STATEMENT OF KEVIN C. MARTIN, PRESIDENT, SOIL AND ENVIRONMENTAL SERVICES, INC.

Mr. MARTIN. I appreciate the opportunity to be here today. I'm going to keep my initial statement short because I'd like to allow plenty of time for questions. I think that's normally more productive. I found it was in the White House Interagency testimony.

I'm an environmental consultant from North Carolina and about 40 percent of my work is involved in wetlands. I have a Bachelors Degree in conservation, a Masters in soil science and hydrology. In essence, by accident, I fell right into the three parameters that are required for looking at wetlands. I can assure you I didn't intend to.

In 1985, about 10 percent of my business was related to wetlands. Currently, it's gone up to 40 percent over the last few years. I am the Chairman of the Technical Committee of the National Society of Consulting Soil Scientists and I'm on the Wetlands Restoration Committee for ASTM. Also I've help test the 1991 manuals and on a daily basis, I'm out in the field delineating wetlands. So most of my comments are going to be based on experience dealing with the 404 Program.

Unlike a lot of other testimony I've heard, I'm going to try to stick to just the aspects of the program that I have firsthand experience in and not broad generalizations about things I don't know anything about.

In general, the White House policy and Senate bill 1304 make steps in the right direction to clarify the muddy wetlands issue that we currently have. In fact, I'm pleased to see that some of the specifics that many of us presented during the White House Inter-agency Task Force meetings have been incorporated into the White House policy.

I do have several concerns related to these matters, however, and associated wetland issues. An appeals procedure for both delineation and permitting is a necessity as you've heard before. Permitting alone would not be adequate; there must be an appeals procedure for delineation. This should be by persons who are not involved in the original action and possibly from an adjacent district. It would be ludicrous to ask the initial person who made the first opinion to come back and reaffirm his own opinion.

A value-rating system is a must. It is briefly mentioned in the White House policy. The hydrogeomorphic classification system that was developed in North Carolina is mentioned. Unfortunately, that system won't work for the purpose that we are after. It only identifies the types and kinds of wetlands that are present but not the way their functions and values can "be ranked" into high, medium and low.

Other systems like those developed by the NC Division of Environmental Management have been utilized and have been shown to work effectively. Such systems allow a person like myself or anyone else who looks at these systems to go to a site and determine, am I dealing with a high, low or medium value wetland. Once you know that, you can immediately ascertain and advise someone as to what their potential is for successful completion of a project. In other words, a high value would have low potential, a low value would have high potential, and a medium value would probably be a negotiated mitigation type project.

Currently, the Corps districts are too free to develop policy that can in many cases significantly change their authority. Luckily, in North Carolina our district uses this power responsibly and in my opinion, has been very responsible and reasonable in their actions. Other districts I have dealt with purposely ignore guidance from the Corps of Engineers office in Washington, D.C. and therefore, this results in property owners in one State being treated totally different than property owners in another State by the same set of laws.

For example, with the nationwide permit, it clearly states under 26, the permit could be authorized for between 1 to 10 acres. However, if in the district's opinion it is a significant impact, the whole process can be stopped, yet there is no way or no procedure for determining what is a significant impact. It's the independent opinion of an individual.

The development of regional indicators of hydric soils by the USDA is a dangerous process and it should be renamed or the project should be dropped. It was initially called regional indicators of soil saturation which was appropriate. There is no such thing as a list of indicators of hydric soils. You cannot reduce an entire field of science to a two-page punchlist which is exactly what is being attempted.

Several government officials in SCS have noted that the imposition of such a criteria could reek havoc if in the wrong hands. If you want to water down soil science, you will have to be prepared to accept huge errors in wetland delineation one way or the other, either vast areas will be claimed that shouldn't be, or vast areas that should be claimed will not be.

Continued funding of the national wetland inventory maps does not make sense. These funds could better be used elsewhere. I'm not in favor of raising taxes, as Senator Faircloth mentioned, to come up with new programs and new issues. I would rather see a redirection of funds that exist. In our experience, the NWI maps do not do as good a job as existing soil survey maps in predicting the presence of wetlands. In fact, if you read the disclaimer on every national wetland inventory map, it notes that the same procedures utilized by the Corps for delineation of wetlands are not those utilized in the preparation of NWI maps. Therefore, it's not consistent with the 404 Program.

For example, funding exists for States to set up wetlands programs but once set up, no money is available to help run the program. It makes no sense. This money could better be directed from NWI to the States to help and assist in their wetland programs.

Proposed funding to map all wetlands in the U.S. is not sane. You should consider the cost and need for this. Who will do it, how will it be done, where will qualified persons be found, and how long will it take and at what cost? I think when those questions are answered, you'll be shocked at the cost that will be there. There is no need to map wetlands on a property unless there is a proposed change of use in that property.

The EPA has already funded projects in various States for mapping that will not be accurate for Corps use. In fact, some of the mapping that is being done if we come up with a new manual, will be no longer valid.

The delineator certification is a good idea for the private sector *and* government personnel. I would like to point out that agricultural land is not exempt, contrary to popular belief. In fact, it is subject to two sets of regulations, Swampbuster and 404, unlike private development that is subject only to 404. Thank you very much.

Senator GRAHAM. Thank you, Mr. Martin.

Mr. James?

STATEMENT OF DAN JAMES, FEDERAL AFFAIRS REPRESENTATIVE, PACIFIC NORTHWEST WATERWAYS ASSOCIATION

Mr. JAMES. Thank you for giving me this opportunity to speak to you today.

PNWA, the Pacific Northwest Waterways Association, includes 149 organizations in the States of Idaho, Oregon and Washington. Our membership includes public port authorities, utilities, irrigation districts, grain growers, major manufacturers, several forest products industry concerns, transportation providers and others interested in the economy of the Pacific Northwest.

Today, I am here representing the work of our Wetlands Committee which includes wetlands biologists, water rights attorneys,

and representatives of several parts, public utilities, and agriculture concerns from throughout the Pacific Northwest.

We have endorsed the administration's wetlands policy and support much of S. 1304. We have on major concern in the bill which we would like to see addressed and that is the benefit of bringing State and local land use planning together with wetlands regulation. You heard a bit about that earlier from Ken Bierly from the State of Oregon.

Most northwest cities and counties develop land use plans to guide both development and preservation. Land is zoned for natural preservation, residential, commercial, industrial and other purposes. The problem arises after the planning process is completed when a public or private landowner seeks to develop its property. For example, public port authorities own a substantial portion of their community's industrial or marine industrial-zoned land. It's not until a client has been identified and the port seeks to develop its industrially zoned property after all other land use decisions have been made that the Federal wetlands process begins. Often it results in a portion of the port's industrial property being delineated as a wetland, which reduces the community's inventory of industrial property and reduces the ability of the local community to meet its economic needs.

As Senator Kempthorne knows, many of our communities in the Pacific Northwest include timber-dependent communities trying to diversify their economies. They are competing to attract new industry with other countries in the Pacific Rim. Their success in winning a new facility can be directly tied to predictable permit decisions to prepare property for industrial sites.

The following are a few of our recommendations to incorporate wetlands regulation into land use planning. Section 12 of S. 1304 sets criteria for wetlands and watershed management plans, "to integrate wetlands planning and management with broader resource and land use planning and management." We agree with this approach. However, we propose to take this concept one step further by allowing local jurisdictions to elect to initiate the Federal regulatory process, including sequencing and alternatives analysis for land use classes as a part of their local land use planning process.

The result of this cooperative process would be the issuance of a programmatic general permit for development, protection and mitigation activities consistent with the plan. We believe this will increase the quality of local land use plans, increase the certainty of implementing the land use plans adopted by local jurisdictions, increase the certainty of protection for valuable wetlands, and increase the certainty that local communities will be able to meet their economic needs. We have included concept language that will meet this objective in our written testimony that we have provided.

In comments on other provisions of S. 1304, PNWA endorses the establishment of deadlines for issuing permits and we support the establishment of mitigation banking as a form of advanced compensation for development. Our written testimony also includes suggestions for modifications. They include the definition of fill material; in section 6, we propose the bill be amended to use the administration's policy regarding appeals which would limit appeals to determination of regulatory jurisdiction, permit denials and admin-

istrative penalties. In section 8, we propose adding confined dredge material disposal areas constructed in uplands to the list of what shall not be considered navigable waters. In section 9, we would add an expressed preference for using mitigation banks over on-site mitigation because of their numerous advantages. In section 12, we propose to broaden the authority to issue programmatic general permits to include activities consistent with approved State or local land use plans.

Finally, there is one issue that is not included in S. 1304 which we propose adding. There needs to be more flexibility in the permitting process to adjust the regulatory requirements based upon differences in wetlands function and values. We believe this is a necessary improvement and we were pleased to see that it was included in the administration's wetlands policy.

PNWA greatly appreciates this opportunity to present our views on wetlands reform to the subcommittee. Thank you for giving us this opportunity to advise you on the wetlands portion of the Clean Water Act reauthorization and we do look forward to working with the subcommittee throughout that process.

Senator GRAHAM. Thank you very much, Mr. James. You may be our last witness for the day and I'm certain you're the witness that came the farthest to be here, so we appreciate that.

One issue that I've been concerned with in this program and have raised several times today has been the relationship between the Federal Government and the States. Is it your general proposition that the States should be encouraged, discouraged from assuming a greater role in the administration of this program. If it should be the States should be encouraged, do you believe that the provisions that are in the legislation as introduced or the administration's proposal would be sufficient to attract the States' interest?

Mr. SZABO. We think that state assumption is a good idea. We think the proposals probably need to address maybe two or three other things that aren't addressed. First, we think the greatest incentive for states is to let the states have some flexibility in program implementation. We don't think they are going to be very interested in assuring the program if they are forced to implement a mini-Federal 404 Program, so you're going to have to give them some flexibility. Second, we think the Federal Government is going to have to let go of the program when states have assumed it, whether through a watershed management plan or a partial State assumption or a full State assumption. We understand that Michigan, for instance, is not happy that the Government looks over its shoulder on all section 404 permit judgments.

Finally, somehow or another, Congress is going to have to figure out how to help the States pay for these programs. We don't think the regulated community wants to spend more money than it is already spending today on these programs. Somehow or another, how state programs get paid for has to be addressed.

Senator GRAHAM. As to the general proposition of encouraging States to assume more of the administrative responsibility, you would think that's a good idea?

Mr. SZABO. Yes, sir. We approve of that.

Senator GRAHAM. Other comments on that?

Mr. INKLEY. I'd like to address that from the perspective of the National Wildlife Federation.

We do have some concerns about making the program easier for State and local governments to assume what is now a Federal responsibility. I would point out, however, that as the Clean Water Act is currently written, there are already mechanisms for the State to assume the program. We do not feel that it is appropriate to relax those standards. One of the great concerns that we have is that there will not be adequate enforcement and oversight of the program should it be delegated to State and local authorities.

I would add that we very much agree with Senator Faircloth's statement that in the condition where a State is granted authority to assume the program, that should not include funding.

Senator GRAHAM. You say it should not?

Mr. INKLEY. It should not include funding.

Senator GRAHAM. Has not the experience of States been that one of the reasons that only Michigan has accepted the current delegation is because of the uncompensated financial burden that is being assumed?

Mr. INKLEY. I think that the point Senator Faircloth may have been making is that it is a very expensive program to administer and by handing it over to the States, the Federal Government will lose additional control of the program and in doing so, perhaps at greater expense for implementing the program. So yes, the State of Michigan has been the only one that has implemented it to date, but we do not have a problem with that. There are other opportunities for States to assume the program.

Mr. MARTIN. I'd just like to say that I'm pretty pleased with North Carolina. The State already, as many States do, handles the 401 Program. Without a 401, your Corps permits are not valid. In essence, they are already dealing with it. I would agree I would not like to see any additional funding appropriated, but as I pointed out just a minute ago, I came up with \$15 million that is not being used correctly that could easily be reappropriated to such issues.

Mr. BROWN. I just might add I think as a general proposition we would want to encourage you to find more creative ways to pass this program downstream. In a perfect world, when I say that I mean that I don't have any hope that the Federal Government will totally disengage from this mechanism, but you could devise a system which recognized that where there are wetland resources that clearly meet the test of being a national resource from a watershed point of view, the Federal Government would stay and play with those and then give consideration to taking the States totally out of play. Then there is a basket of resources after that the Federal Government has clearly not put in play that would then be properly put into the States' basket of manageable resources.

Then if the State wishes to go beyond that and move that down to a county to regulate on some basis, they can do it but at least under that type of a system, a landowner or an applicant for a permit can discern is this a federally regulated resource and go there and not have to concern himself with State or local regulation, or is it a State-regulated resource in which case he doesn't have to concern himself with county or Federal.

As it stands now, if I apply for a permit in the State of Florida and other States in which our companies do business, I not only deal with the Corps of Engineers, EPA, and U.S. Fish and Wildlife Service at the Federal level, but I deal with the State of Florida, the county, and a water management district all regulating the same resource, all with slightly different definitions of what constitutes a wetland and what does not, and all with differing mitigation requirements, and I'm supposed to somehow, through some measure of shuttle diplomacy, finally end up with a permit that all of those people buy off on.

I would like to see that we come to a place where there is a set of Federal resources that are important as national resources and the rest is left to the States and the Federal Government gets out of it and if the States, want to in their own programmatic agenda delegate that down to counties and other water management districts, let them do it.

Senator GRAHAM. My time is almost up. Senator Faircloth?

Senator FAIRCLOTH. I'll start with Dr. Inkley. I am opposed to the Federal Government giving money to the States unless they take it out of existing Federal programs. I would very much be in favor of passing the authority to issue permits and regulate the system down to the States and even the counties, but let's reduce the Federal bureaucracy as a means of doing it. That was what I was saying a while ago, I don't think you're going to see any Federal agency want to give up anything.

What I would like to see is the counties and certainly the State given the authority to issue or deny permits and the Federal EPA with no oversight unless they go to the Federal courts to question the decision.

What you're saying is you like Ms. Boxer's bill. Ms. Boxer's bill denies the right of appeal of the government's determination, is that right?

Mr. INKLEY. No, that's not correct. The Boxer bill does not contain a provision regarding the appeals process such as the Baucus-Chafee bill does and we do support that segment of their bill which does provide for an appeals process. It is simply unaddressed in the Boxer bill.

Senator FAIRCLOTH. In the Boxer bill, you have to go to court to appeal it, isn't that right?

Mr. INKLEY. That is correct and we do support the establishment of an appeals process as indicated in the Baucus-Chafee bill.

Senator FAIRCLOTH. You're saying that is the part of the Boxer bill you don't like, you should have an appeals process?

Mr. INKLEY. There is nothing about the Boxer bill that I do not like. It is simply an omission in the Boxer bill that is a provision of the Baucus-Chafee bill which we support.

Senator FAIRCLOTH. Don't tell me we've made an omission.

Mr. Martin, as a practitioner in wetlands, have you seen land delineated as wetlands thereby subject to rules and regulations when it was not?

Mr. MARTIN. I've seen it on many occasions.

Senator FAIRCLOTH. Why was the mistake made? What happens in such a case?

Mr. MARTIN. There are several reasons. People are human and that is who is putting the line on the ground out there and humans make mistakes. Fortunately in North Carolina, anytime I've run across such a situation, the Corps has been ready and willing to come to review even though there is no appeal procedure currently, based only on a telephone call or request. However, in some other districts, the northeast, for example, we've made requests in some cases for a year-and-a-half and were denied at the district and the Washington level an appeal to relook at the delineation under any circumstances.

Senator FAIRCLOTH. If a farmer was told by the Corps that his land is wet and you find it is not, what recourse does he have?

Mr. MARTIN. It would be the same. In North Carolina, we'd have a very good recourse. The Corps would be glad to meet me, discuss the issues. In other States, some of the farmers would just be out of luck unless they went to court which like you pointed out, they wouldn't be able to afford to do.

Senator FAIRCLOTH. You've worked in a number of States as a wetlands consultant. Do Federal agencies vary in the application of the law from State to State?

Mr. MARTIN. Yes, they do. As I pointed out in the White House testimony, lots of time it's through policy decisions. For example, I'll give you one that North Carolina did that I would agree with. They were told by Washington, D.C. not to implement the regional indicators of soil saturation, yet North Carolina and South Carolina both utilize those in wetland delineation even though they were specifically told not to until it was finalized.

I've seen other cases where I didn't agree with what was happening but there was nothing we could do about it because the policy at the district level was, "we decided not to do it because we don't want to".

Senator FAIRCLOTH. I understand that agriculture is exempt, is that right? If it is, why do I get so many calls from people in agriculture and in farming that are having problems? What brings that about?

Mr. MARTIN. I can't answer all of that. I was riding around in blueberry fields and cow pastures last week with the Corps of Engineers and if agriculture is exempt from the wetlands regs, I think myself and the Corps personnel I was riding with would like to know why we were out there doing it. If it's exempt, I don't think we should have been doing that. The Corps personnel was just as frustrated by the case as I was.

Senator FAIRCLOTH. We see that agriculture is exempt but we continue to have problems with it, time and time again.

I have read the Chafee-Baucus bill that \$4 to \$5 million would be appropriated to assist small landowners to comply with 404 programs. What effect do you think this would have and where would you see the funds being utilized?

Mr. MARTIN. I am not for sure how it would be apportioned. That would be a question I would want to know, how you get it and \$4 to \$5 million wouldn't go anywhere in handling the process that you would have to go through in wetland permitting, mitigation, et cetera, so I think it would be a big nightmare trying to decide who gets what and how it would be utilized.

Senator FAIRCLOTH. Mr. Kleckner, you were talking about farming and I thought I knew a little bit about it but the administration does not consider haying, I assume mowing, cutting, planting, and grazing a normal ranching activity. Being familiar with farming, would you tell me what is a normal ranching activity if cutting hay and grazing cattle is not?

Mr. KLECKNER. Senator, that's just as normal as the sun rising in the morning and setting in the evening. Somehow in the infinite wisdom of the Government, they have exempted that. I think it goes back to your question to Kevin Martin just earlier on agriculture is supposed to be exempt from wetlands regulations or at least normal farming practices, but they are not. It is frustrating as Kevin Martin says and you're hearing from your constituents. I guess raising corn, tobacco or soybeans is normal, but haying, grazing, cutting for hay and baling is not normal farming practice, I don't understand how that can be because it is a normal farming practice. If you are a cattle farmer, you make hay, you bale hay for the cattle. That ought to be a normal farming practice.

Exempting, I think what I said in my testimony, I think it's simply a mistake on the part of the Congress to say that annual farming but not perennial farming is exempted in certain areas, but trees, hay and pasture are normal.

Senator GRAHAM. Senator, your time has expired.

Senator FAIRCLOTH. I have one quick comment. I can answer the question exactly: The people writing the rules have never played the game.

Senator GRAHAM. Senator Kempthorne.

Senator KEMPTHORNE. Mr. Kleckner, in the State of Idaho, among the farmers and ranchers this whole issue of the definition of wetlands has been a real dilemma, not only what is a wetland but what is not a wetland. Is that your experience in the rest of the country, is it the same dilemma and how do the average farmers become aware that their property contains wetlands that are subject to regulations?

Mr. KLECKNER. I think when they want to do something that's out of the ordinary, someone tells them or they think I'd better find out if I can do this or not. We've gotten to the point in this country now where a lot of normal things are forbidden and can I clean a ditch, for example, can I tile, there's a few trees in this area that have grown up and to make my rows straight, I think I'll take those trees out and that will help my farming practice. If you're in North Dakota, it could be a little bit of what is now called a prairie pothole, as little as a few feet, they can't farm through that. There is now a prairie pothole program in the Dakota, maybe in Minnesota, maybe even in northwest Iowa where farmers say I would like to keep this as a pothole, for example, but I think I should be paid for it for the environment because it's going to be land that I won't farm or I can't farm and I'm concerned about ducks also and we're advocating and people that want to pay a farmer, that's my pothole. A Mississippi lawyer I'm familiar with got a prairie pothole on a farm in North Dakota but two people are willing to do it and he's actually paying.

I would suggest that these environmental groups running around the country sending me letters on occasion asking me for money,

and I cry when I read the letters because they are ducks and cat-tails, and their budget in 1991 was over half a billion dollars. Instead of spending the money going into court and fouling up the system, and sending out more letters for me to send in money, why don't they actually buy some of these farms and pay taxes on it to support the local school district. That would make sense to me for that half a billion that they are raising, just the 12 biggest ones. Beyond that, I'm not sure.

Senator KEMPTHORNE. In relative terms, how high a priority is resolution of this wetlands issue to the American Farm Bureau?

Mr. KLECKNER. Number one priority. Of the four or five priority issues we have, this is the number one priority issue in 1993. There is nothing anymore frustrating for farmers and ranchers around the country than trying to sort through the maize of wetland regulations that to them don't make any sense and they can't get straight answers from twice in a row.

Senator KEMPTHORNE. As I understand it, you support the concept of the Soil Conservation Service as the lead agency for wetlands determination in agricultural lands. If the Soil Conservation Service is so designated as the lead agency in dealing with wetlands, what kind of oversight or consultation if any would you consider acceptable from the EPA, the Corps of Engineers or Fish and Wildlife?

Mr. KLECKNER. I'm very leery of that oversight responsibility. To me there needs to be oversight in some manner but we supported the administration when they announced that SCS would be the delineator for agricultural land but going on to say that they would do it in consultation with or an oversight again with Fish and Wildlife, et cetera, I said oh, brother, here we go again. So I think it is the degree that would be involved.

I think in the end, the answer is there always needs to be an appeals process. I think we need to have a single delineator for farmers who can go one place and get an answer but I'm sure there will be disagreement with the delineations both ways.

Senator KEMPTHORNE. Why does the Farm Bureau not endorse the no net loss of wetlands goal?

Mr. KLECKNER. I think one of the big reasons would be that we don't think, at least up to now, that wetlands have been defined properly and how can you define a no net loss of wetlands when there is no agreement on what wetlands are.

To interpret our opposition to no net loss of wetlands to saying you're in favor of draining the Okefenokee Swamp and the Florida Everglades and the Great Dismal Swamp, et cetera is wrong. I don't know anybody that wants to do that.

The lack of a clear definition of wetlands is what concerns us and to say then for us to agree to a no net loss when we don't know what's even being talked about with wetlands is our problem. I would certainly disagree with what I heard earlier here on this panel that there's been a 290,000 acre annual net loss of wetlands in the country. Since 1985, since Swampbuster, I'm not so sure there's been any loss of wetlands in the country if they are defined property and count everything. Certainly to come up with a figure like that, you're exempting a lot of things from being counted and you're counting things that shouldn't be counted.

I can't bring wetlands on my farm in Iowa back into production if it's there under Swampbuster, nobody else can. I don't think we've had a net loss of wetlands in this country to any degree at all since 1985.

Senator KEMPTHORNE. Mr. Kleckner, thank you very much.

Mr. Chairman, I would just reiterate how much I look forward to working with you to resolve this wetlands issue.

Senator GRAHAM. Thank you very much, Senator. I share that feeling.

I'd like to pursue that line of questions as it relates to SCS. If we have a program that is going to make it more likely that States will accept the responsibility for administering the program, how would you see dealing with the issue of agriculture and specifically the role of SCS, should the agricultural side as well as the Corps of Engineers and EPA components be all subject to assumption and/or delegation by States or should the SCS portion be treated separately? If so, how should that separate treatment be?

Mr. KLECKNER. I'm not sure I can answer your question and I think I understand it. I don't know that I have an answer. The Soil Conservation Service is really connected at all levels, local and State and Federal in USDA. I'm not sure I think that's really the way Fish and Wildlife and the Corps of Engineers are, although they have offices out there. I think of them as more completely Federal.

This isn't answering your question very well and perhaps Mr. Martin or Mr. Szabo could answer your question much better than I. SCS it seems to me is thought of in the country as local, we know the people. I think of them as really experts in the area, that's their job to work with farmers, to look at soils. They know it and are trained that way as Kevin Martin. So I respect their judgment.

To be honest, I've got a lot more questions about respecting the judgments of the other agencies. I've seen them more to be adversarial. I apologize, I'm not answering your question exactly as you asked it.

Mr. SZABO. Let me try to take a crack at question. We think if the Congress is trying to treat agriculture with surety and certainty, the one distinctive feature of their current treatment is that there is a Soil Conservation Service person in every county and every parish of the country. That's not true for the Corps and the EPA. Therefore, there is a better chance of getting a consistent message the same page than you have the other agencies.

Whatever you do with agriculture, it seems to us that you have to take into consideration that reality and what will happen to those resources they are now delineating in the counties and parishes for the agricultural community.

Senator GRAHAM. That completes my questions.

Senator Faircloth?

Senator FAIRCLOTH. Talking about this loss of wetlands, we've heard it and heard it. I don't know from what period they started counting but this country gained millions of acres of wetlands between 1870 and 1950, millions of acres. The land that was cleared in this country from the beginning of agriculture about 1950 was that land bordering rivers, land that had a lot of nutrients in it deposited there over the years. This is the only land that really had

natural fertility in the southeast that you could farm. At that time, the Federal Government and the county and State governments worked the rivers, they were drained, there was natural drainage. These lowlands were ditched, drained and farmed.

Once the rivers ceased to be used for navigation and some very small rivers were used at one time, they ceased to be maintained. Chemical fertilizer, South American guana became available, Chilean nitrogen, so there was no longer a need for the natural nitrates. Vast areas of the southeast, particularly and especially all up into Virginia, were abandoned as farmlands.

The loss of wetlands began in 1950, and was started by the Corps of Engineers and the ASCS paying for canals, drainage, tile-laying: an aggressive program followed into the early 1970's. SCS supplied technical knowledge and the ASCS supplied the money to pay for it. Vast areas of the country were now drained. Of course the Corps was involved in channelization of rivers and the destruction of a lot of wetlands.

I appeared before Herman Talmadge and the Agricultural Committee in the late 1950's to say that the Federal Government was making a mistake draining farmland. We were supporting prices and bringing too much land into production. I was almost laughed out of the hearing room because we were getting ready to have worldwide starvation. As a farmer, we've heard that every year that crops are really going up, we're going to have worldwide starvation and what I said about not paying for anymore drainage was laughed out and I went home and forget it and kept on draining.

Now the same wisdom coming out of the same people has decided that to drain anything is a mortal sin. I don't know how they could have been so stupid 20 years ago and acquired this infinite wisdom in such a brief period of time but they obviously have.

If there is anything that has been overstated, it's the loss of wetlands. Certainly in Florida, the Everglades, and Senator Graham as Governor provided great leadership and a great program to begin restoration and a lot needed to be restored. It's a unique situation. The Corps of Engineers channelized the Kissimmee River and changed its name to Channel 38 and now they are restoring that.

I have one question and I'm going to quit for the day. Mr. Martin, you heard the question this morning I asked Mr. Larson about the growing seasons. Give me an answer to what you think of what he said if you understood what he said?

Mr. MARTIN. I think it was a good example of a lot of what I've seen. Unfortunately, persons in academia as well as in some of the agencies are office-bound and don't get hands-on experience dealing with the day-to-day regulations. He was expounding about certain plants have this growing season and that growing season when I assume your question was related to what is the growing season that the Corps of Engineers utilizes in implementation of the 404 Program, which is clearly stated, unclearly in the criteria. There is more than one way to determine it according to the current rules. There is no way to determine which way is the right way, according to the rules. By the right way, I mean which one will be determined by the Corps to be right. It seems to be a preponderance of this kind of occurrence that is happening with the growing season.

In reality, the growing season in North Carolina is based on a frost-free period, anyone that goes outside that has trees knows the leaves fall off of the trees in the fall and they grow back in the spring, so the growing season ends when the leaves fall off the trees, and most wetland plants also die then or go dormant.

The problem that I think you were getting at was from a realistic frost-free period in North Carolina, say in the Piedmont, roughly April through October is the growing season, but by the definition currently utilized by the Corps manual, it extends it into March through November in North Carolina which would encompass times of the year when plants are not actively growing.

Senator FAIRCLOTH. Mr. Larson extended it year-round. He said certain water-bearing plants or plants that grow in wetlands grow year-round. Mr. Larson was totally confused.

Mr. MARTIN. I agree. If the Congress did something like that, which is currently not the criteria, if they did, you would find instead of 80 percent, east of I95, probably 90 percent of that part of the State of North Carolina would meet the criteria in the winter when the plants are not transpiring and the water table as high.

Mr. INKLEY. If I could comment on that briefly. I would point out that there are three criteria which are frequently used to determine whether or not a particular area is a wetland. Those criteria include the presence of hydric soils, the presence of hydrophilic vegetation, and hydrology.

The fact of the matter is that area could be flooded for extensive periods of time and may not be the growing season at all. Would that then lead to that area not being called a wetland and would you believe that area should not be called a wetland? The fact of the matter is the area could be flooded for 3 or 4 months during the winter period when there is no growing season. Does that mean it is not valuable as a wetland? It could have extremely important functions and values as flood control, important over wintering value for waterfowl such as the bottomland hardwoods in the southern part of the country.

Senator FAIRCLOTH. Maybe you should give me your description of a growing season in eastern North Carolina, quickly?

Mr. INKLEY. Now I regret jumping into it. Actually, the definition of the growing season with respect to the way wetlands are delineated is applied to the determination of whether an area is a wetland has to do with crops, it does not have to do with hydrophilic vegetation.

Senator FAIRCLOTH. That's exactly what I was talking to Mr. Martin about and that is exactly what Mr. Larson was dancing around this morning. He went all over the woods.

Mr. INKLEY. It also makes the point that the area could be flooded for extensive periods during the nongrowing season and it really is, technically in my perspective, a wetland.

Senator GRAHAM. Senator Kempthorne?

Senator KEMPTHORNE. Mr. James, several of the witnesses today, like you, I believe, have recommended that wetlands delineation and planning and mitigation be considered at earlier stages in development. S. 1304 seeks to accomplish this by connecting wetlands permitting with watershed planning. You recommend that local

land use planning provide the vehicle for earlier consideration of wetlands issues.

Which do you believe is the superior approach and why or are they complementary?

Mr. JAMES. I believe that they are complementary. We believe that State and local jurisdiction should be given the opportunity invite the Federal regulators in as they are developing their land use plans. We would not like to see that be imposed on State and local jurisdictions. We think that each State and local situation is different and that those jurisdictions should be allowed to invite the Federal regulators into their planning process to provide guidance and oversight and facilitate the issuance of a Programmatic General Permit upon federal acceptance of the State or local plan.

Senator KEMPTHORNE. Mr. Martin, the Farm Bureau cites a recent Duke University study that concludes the National Wetlands Inventory maps and even the soil survey maps have no more than a 35 percent accuracy rate. Are you familiar with this study?

Mr. MARTIN. Yes, I am familiar with it. It was out of Duke University. I don't know the exact numbers you're quoting but there was a significant amount of error that would be not adequate for our purposes for wetland delineation under a Corps program unless as a property owner you are willing to have that kind of error. That's the reason I mentioned the cost of delineating the Nation. If you look at the cost of a soil survey per county and there is that much error, what's it going to cost to get it right? We can't afford it, there is no way.

Senator KEMPTHORNE. So you don't dispute the Duke University study that it is a very low number?

Mr. MARTIN. I have seen errors on NWI maps of 100 percent in both directions, errors that were obvious wetlands that were not caught and errors that were obvious nonwetlands that were called wet. The soil survey, however, in my opinion is much more accurate in undisturbed areas. Obviously, in a crop farm field that is ditched and drained, it doesn't matter what the soil type is. The soil survey could serve the purpose of the National Wetlands Inventory equally or increase the accuracy so why not take that money and put it to something more useful.

Senator KEMPTHORNE. Let me ask you this, what tools if any can science provide in classifying and ranking wetlands according to high and low values?

Mr. MARTIN. I'd be glad to send you a copy of the third draft of what North Carolina uses, the Division of Environmental Management which looks at all the functions and values of a certain site, various ones and rank it accordingly. For example, in what was proposed by the White House, it would call an area of bottomland hardwood. If you had an acre of bottomland hardwood wedged in between two K-Marts, it's value would not be the equivalent of a bottomland hardwood flood plain that was a continuous corridor of hundreds or thousands of acres, whereas under that methodology they would both rank equally.

Senator KEMPTHORNE. I think I read in history that much of Washington, D.C. had to be drained in order to build this facility. Isn't that ironic.

Mr. Szabo, I'd like to ask you to discuss your perspective of how many acres of wetlands are lost each year?

Mr. SZABO. I have some of the same concerns that Mr. Kleckner mentioned about the numbers. Three hundred thousand acres of less a year, I think, translates to about 10 square miles a State that is being lost (if you divide 640 acres per square mile into 300,000 acres). We're losing in coastal Louisiana 25 square miles annually of our coastal wetlands. This morning, the NOAA witness said we were losing nationally about 32 square miles of coastal wetlands annually. So I'm confused about where all those other acres are being lost because we haven't had an expanding economy with a lot of construction and my perception of agriculture, is that the tiling of agricultural land has been declining, so were not sure where all those additional area of wetland conversions are coming from.

Senator KEMPTHORNE. Mr. Inkley, I understand the administration proposal and S. 1304 both provide exclusions from wetlands regulations for prior converted croplands. How do you suggest we treat other kinds of land that may have been developed at some point and then fallen into disuse, for example, a waterfront area along a river or lake. We have a specific example I'm aware of where a new owner has purchased it and for approximately 100 years it had been a dump site—railroad ties, old cars, mill machinery. They removed all the junk, it left crevices and they filled those. They've now been cited for filling a wetland area. How do we deal with this?

Mr. INKLEY. The issue you bring up is the issue of prior converted wetlands. The prior converted wetlands issue is one we have had a lot of concern about. Basically, it says if you have a wetland that was converted to agricultural land prior to 1985, then that would be exempted from regulation under section 404 of the Clean Water Act. That affects 53 million acres of wetlands. Many of these areas continue to have the potential to be very important, especially if they were restored.

I can recall having worked with Mr. Martin before in testifying before the White House Interagency Task Force and he identified that these 53 million acres of wetlands were prime areas that could be used for restoration of wetlands. Indeed, we do need to look at these for restoration but they continue to have many important functions and values as wetlands even today. So we're very concerned and oppose the blanketing exemption of prior converted wetlands.

With respect to your question about lands that have been abandoned, we believe lands that have been abandoned from agricultural production should, if they have reverted to their natural characteristics as wetlands, they should be protected as wetlands, they should fall under the purview of section 404 of the Clean Water Act.

Please understand that we also recognize—I know there has been dispute today on this panel about it—but the normal, ongoing ranching, farming silvicultural practices are allowed to continue under the Clean Water Act as it exists today. The fact of the matter is if you have a drainage ditch that needs maintenance and clearing, you can go ahead and do that. If you want to expand the

capacity of that drainage ditch to drain additional wetland, yes that would be regulated by the Clean Water Act and it should.

Senator KEMPTHORNE. Is there room in all this regulation for common sense?

Mr. INKLEY. Absolutely. One of the problems we are facing here is that we have already lost half of the Nation's wetlands, 100 million acres. It makes a lot of common sense to a town that last week voted to move itself to higher land because of the flooding that we should provide additional protection to wetlands.

Mr. MARTIN. The statement that Dr. Inkley made in general is in some cases about PC land, true. One exception that I can think of immediately, and these are the problems, are the exceptions. The blueberry farm I was on last week with the Corps, blueberries themselves are wetland plants, the weeds that grow in between them are wetland plants. Blueberry plants have a definitive life. At a point, they die. When they die, they must be replanted. Obviously, the farmer can't do it instantaneously, it takes a while a big significant outlay of funds but by literal interpretation of the law, if he went out, yanked the blueberry plants out today and went back to plant them tomorrow, he would have to get a permit because it's now a wetland. It meets the vegetation, the soils and the hydrology. So these kind of problems I think are the horror stories that you've heard from the Farm Bureau. They do exist and they are out there. That is a big challenge for you to figure out how to handle those because the site I was at has been in blueberries since 1945. All they want to do is put them back.

Senator KEMPTHORNE. I know my time has expired but I've asked all a question except Mr. Brown, may I offer him the potluck where he can have any final statement he'd like in this?

Mr. BROWN. You asked the question and I'll try to answer, can you bring some common sense to this program. One of the things I'd like to suggest you give some thought to, and I know it is antithetical to the environmental agenda, one of the goals of this program it seems to me is to find a way to appropriate private capital for the restoration of this 53 million acres of farmland that may some day be developable land in some way, shape or form. It occurs to me if you're going to do that, you have to create a system in which private capital finds an incentive to invest in this endeavor.

I would go back to my fundamental statement I made earlier that classification is the linchpin that will do that. Imagine a system in which at the time I ask for a jurisdiction delineation on a 10,000 acre site that I plan as a master plan community that takes 25 years or so to develop, that I could simultaneously have a determination made that some of the wetlands that exist on this site are of high value, some are low, some are medium; assume within the low value wetlands I could immediately proceed to a mitigation component and the law required me as a condition of doing that I would bring back to the system something in excess on a function and value basis that I took out—120 percent, 150 percent, I don't know what the percentage should be but I would be putting back in the system a higher value function and value wetland than I took out. The tradeoff for that is I got to go there quickly without practicable alternatives and without sequencing so

I immediately have eliminated one of the major bones of contention for those of us who have to work the permit process.

If I want to look at a medium value wetland, the ante goes up and in that situation, my recommendation is you would have to go through the iterative process of showing your avoidance, your minimization and your compensatory mitigation but it would be looked at holistically, it would not be looked at in the rigid sequence because sometimes that tradeoff is well shown and is well worth the price of admission. The ratio might go up because I am now approaching a higher value resource.

For the high value wetland, maybe here the rigid sequencing, the rigid practicable alternatives would be in play and the ratio would be even higher.

What does that say to the private sector, you immediately have imposed market-driven forces that will work for the avoidance right off the box because no one in my business is going to go out and look for the opportunity to fill high value wetlands under that type of system. We will avoid automatically. We know that if we attack medium value wetlands, what the price of admission is going to be and what difficulties are encountered but our capital will definitely be attracted to low value wetlands and we will be saying we're prepared to sacrifice some of those in exchange for getting more back into the system through restoration and rehabilitation by using the private capital we would bring to play to do that.

That essentially ultimately happens at the end of the permit process but it takes 2 and 3 years to get there. If you had the courage to look at something really creative and take the blinders off the system we have in play now, and trust the market system to channel capital where it needs to go, there really is an opportunity to do that.

My real objection to premature classification is my experience has been is that develops a series of rigid parameters that are oftentimes wrong but it locks them in cement. These resources are fluid. Sometimes they are a wetland, sometimes they are good, sometimes they are bad, so I agree with the President when he says the prior categorization would not give consideration to individual impacts associated with the specific projects. The reverse is also true, I don't want a system that goes out and does what aided studies do now and preclude me from bringing in a project-specific solution.

So I say to you when you do your watershed studies, develop the criteria for classification so that I can hire my consultant to go out and look at that resource and get a preliminary determination, do I want to buy the land and what problems are associated with it, and when I bring out the Corps to look at it, they look at that land and we get not only my delineation but I get my classification. Now, I'm in a position to determine exactly what economic consequences are going to inure to my benefit and how much capital can be brought to bear on the system.

Senator KEMPTHORNE. Thank all of you for your excellent important input.

Mr. Chairman, I commend you for conducting such a worthwhile session today.

Senator FAIRCLOTH. I would like to do the same thing and I want to ask one quick question of Mr. Brown to answer yes or no. If Arthur Davis had to sit through this hearing today, would he have ever bought Boca Raton?

Mr. BROWN. No, sir.

Mr. SZABO. Mr. Chairman, may I raise one more issue. The Oil Pollution Act of 1990 uses that broad "waters of the United States" definition that you referred to earlier. The Minerals Management Service of the Department of the Interior is right now trying to do its \$150 million financial responsibility regulations under the Oil Pollution Act and they are realizing that the Act could cover tanks on farms that might be located on wetlands. That's not really what Congress was looking at. So they don't see any flexibility. They are concerned about the burden of the proof of financial responsibility requirement. The Committee might want to look at this issue as it reauthorizes the Clean Water Act this year.

Senator GRAHAM. Thank you very much. I appreciate your bringing that to our attention.

I want to thank each of you for the excellent presentation you've made and the contribution to our understanding the reality of this program as it affects the folks that each of you represent. We appreciate your assistance.

The hearing is adjourned.

[Whereupon, at 6:00 p.m., the subcommittee was adjourned, to reconvene at the call of the Chair.]

[Statements submitted for the record, and the bill S. 1304, follows:]

TESTIMONY OF JIM LYONS, ASSISTANT SECRETARY, NATURAL RESOURCES AND ENVIRONMENT, U.S. DEPARTMENT OF AGRICULTURE

Good morning Mr. Chairman and distinguished members of the Subcommittee. We are pleased to appear before you today to outline the Clinton Administration's wetlands policy. This statement is being presented on behalf of the Environmental Protection Agency, the Army Corps of Engineers, the Department of Agriculture, the Department of the Interior and the National Oceanic and Atmospheric Administration. This joint statement demonstrates the tremendous cooperation and coordination among the Federal agencies that participated in the Interagency Working Group on Federal Wetlands Policy that produced the Administration's wetlands policy.

Three weeks ago the Administration released a comprehensive package of improvements to Federal wetlands policy. This package reflects a broad-based consensus within the Executive Branch. It is a departure from the gridlock of the past and contains a balanced, common sense, workable set of initiatives that will make Federal wetlands policy fairer, better coordinated with State and local efforts, and more effective in protecting wetlands. We have attached the Administration's full policy statement to this testimony.

We would like to begin by briefly describing why wetlands protection is important, and then provide some background on the process used to arrive at this consensus package. We will then highlight some of the main provisions of the Administration's wetlands policy, noting in particular where Congressional action is recommended and whether these provisions are similar to S. 1304, the Baucus-Chafee wetlands bill.

Why Wetlands Are Important

Wetlands are among our Nation's most critical and productive natural resources. Wetlands are the vital link between land and water. They provide a multitude of services to society, are the basis of thousands of jobs, and contribute billions of dollars to the economy. Wetlands fulfill vital functions within the ecosystem, such as wildlife and aquatic life habitat and food chain support, water quality improvement and flood storage, and shoreline erosion control. In some areas, up to two-thirds of

our commercial and recreational fisheries are dependent on wetlands in their life cycles. This means that wetlands protection may contribute over \$15 billion annually to our economy for fisheries alone. A high percentage of our endangered species rely directly or indirectly on wetlands for their survival. Protecting wetlands is essential if we are to achieve the Clean Water Act's objective to restore and maintain the chemical, physical, and biological integrity of the Nation's waters.

Given the fact that wetlands are so important, it is a tragedy that we have lost over 50 percent of the wetlands that were present in the coterminous United States at the time of European settlement. Information available from the U.S. Fish and Wildlife Service shows a loss rate of 290,000 acres a year from the mid-1970's to the mid-1980's. From the mid-1980's to the present, agricultural wetland losses have declined significantly due to the enactment of the Swampbuster provision in the 1985 Farm Bill. While these represent an improvement from the 450,000 acres we lost annually from the 1950's to 1970's, it is still far more than the Nation can afford.

The Consensus-Building Process

The Interagency Working Group was formed in response to a request to President Clinton from seven Senators. The purpose of the group was to provide a forum to allow the appropriate Federal agencies to work together, with input from members of the Congress and the public, to develop a consensus on wetlands policy issues. The group was convened by the White House Office on Environmental Policy in June and included nine agencies: the Environmental Protection Agency (EPA), the Army Corps of Engineer (Corps), the Office of Management and Budget (OMB), and the Departments of Agriculture (USDA), Commerce, Energy, Interior, Justice, and Transportation. In addition to interagency discussion, the Working Group solicited the views of a broad range of stakeholders representing all perspectives in the wetlands debate, including members of Congress, representatives of State and local government, environmental interests, the development community, agricultural interests, and scientists. With this information in mind, the group met intensively over many hours to develop a package of more than forty specific initiatives. The result is a significantly revised Federal wetlands policy that provides fairness, flexibility, and predictability to landowners, farmers and others, while also ensuring more effective protection of our Nation's wetlands.

President Clinton's Plan

The Clinton Plan includes both regulatory improvements and innovative, nonregulatory approaches to protect and restore wetlands. It includes administrative actions, some of which took effect immediately and others that will begin during the coming months. It also includes legislative recommendations for Congress to consider during reauthorization of the Clean Water Act. Several of the themes of this package are consistent with S. 1304 and S. 1114.

At this time, we would like to highlight some specific elements of the policy. A guiding principle in formulating the policy was to exercise strong Federal leadership while empowering State and local action. The Administration believes that the Federal government should lead by example as well as by directive. To this end, the existing Executive Order on wetlands will be revised to establish an interim goal of no overall net loss of wetlands and a long term goal of increasing the quantity and quality of wetlands. We are pleased to note that S. 1304 establishes the same short and long term goals as the Administration. The revised Executive Order will also direct Federal agencies to take a watershed or ecosystem approach to wetlands protection and restoration in working toward these goals.

The Administration policy also identifies voluntary, non-regulatory wetlands restoration as an essential vehicle to achieve these goals. The Wetlands Reserve Program (WRP) is a crucial part of the Administration's wetlands restoration plans. The 1990 Farm Bill requires a minimum of one million acres to be enrolled in the WRP by the end of fiscal year 1995. The Reconciliation Act of 1993 amended the WRP acreage provisions to require not less than 330,000 acres be enrolled by the end of 1995, reduced the minimum acreage target to 975,000 acres, and extended the enrollment period from 1995 to 2000. In 1992, a 50,000-acre pilot of the WRP was very well received, with proposals from 2,300 farmers to restore 250,000 acres. The fiscal year 1994 Agriculture appropriations provides for 75,000 new acres to be enrolled, which would more than double the number of States eligible for participation in the program. Under the policy, the Administration will use this program in the Midwest in conjunction with emergency assistance programs to restore wetlands and assist farmers affected by the recent flooding. The Administration will pursue full funding of the President's budget request for the Wetlands Reserve Program in FY 1995 and will seek to have this program expanded in the FY 1995 Farm Bill.

In addition, the Administration will examine opportunities to expand existing Federal programs that seek to restore wetlands through cooperative, voluntary agreements with private and other non-Federal landowners. The Administration is pleased to note that S. 1304 also promotes wetlands restoration.

To increase State and local roles in the wetlands protection and to reduce duplication between wetland protection programs on different levels of government, the Administration encourages Congress to adopt several measures. The first is to authorize the development of State/Tribal watershed protection programs which should provide for local and regional involvement and Federal approval of State programs, including minimum requirements for wetlands protection and restoration planning. In addition, the Administration recommends that Congress provide EPA with the authority to use its Wetlands Grant program to fund both the development and implementation of State/Tribal Wetlands Conservation Plans. Congress should also authorize partial assumption of the section 404 program by States and Tribes as an interim step toward full assumption. Finally, the Administration recommends that Congress amend Section 404(e) of the Clean Water Act to provide explicitly for the issuance of programmatic general permits with appropriate environmental safeguards for approved State, Tribal, regional, and local regulatory programs. Most of these measures, with the exception of those related to assumption of section 404 programs, are in S. 1304.

The Administration policy will streamline and clarify wetlands programs affecting the agricultural community. At the heart of this effort is a commitment on the part of all Federal agencies to minimize duplication and reduce inconsistencies between the Swampbuster and section 404 programs. To that end, the Soil Conservation Service (SCS) will be the lead Federal agency for wetlands determinations on agricultural lands for both programs, in consultation with the Fish and Wildlife Service and under the programmatic oversight of EPA and the Corps. The SCS will use agreed-upon methods that are consistent with those used by EPA and the Corps, and will participate fully in an interagency training program to ensure that field personnel are properly trained.

In addition, the Administration has issued a final rule that affirms the exclusion of an estimated 53 million acres of prior converted croplands from Clean Water Act jurisdiction. These are areas that, prior to December 1985, have been cropped and hydrologically manipulated to the extent that they no longer perform the functions they did in their natural condition. Consistent with S. 1304, the Administration recommends corresponding Congressional action to define the term "waters of the United States" in the Clean Water Act to exclude prior converted croplands.

The Administration policy also addresses landowner concerns regarding the section 404 program. The Corps will develop, through rulemaking, an administrative appeals process under the regulatory program so that landowners, farmers, and others can seek review of jurisdictional determinations and permit denials without going to court. The Corps will also modify its regulations to impose deadlines to ensure that permitting decisions are made in a timely fashion. The policy also endorses the use of mitigation banks for compensatory mitigation under the section 404 program within environmentally sound limits.

The Clinton policy takes several steps to increase the predictability and public acceptance of efforts to identify areas as wetlands subject to jurisdiction under the Clean Water Act. Use of the 1987 wetlands delineation manual has provided a workable and broadly accepted delineation procedure over the past two years. The Administration supports continued use by all agencies of the 1987 manual pending completion and review of the National Academy of Sciences study, expected in September 1994. To increase public confidence in the section 404 program, the Administration also is recommending Congressional endorsement of continued use of the 1987 manual, which is provided for in S. 1304.

To put to rest the notion that Congress did not intend to protect wetlands under the Clean Water Act, the Administration recommends that explicit definitions of the terms "wetlands" and "waters of the United States" be included in the statute, consistent with longstanding regulatory definitions. S. 1304 does include the definition of "wetlands."

Finally, the Administration's policy revised the definitions of discharge of dredged or fill material to close regulatory loopholes that allowed wetlands to be drained, ditched, or cleared without a section 404 permit. The Plan recommends that Congress affirm these definitional changes in legislation, as does S. 1304 for the "discharge of dredged or fill material."

Conclusion

In conclusion, we believe the Administration's reform package represents a tremendous opportunity to move beyond the polarization that has characterized the wetlands policy debate in recent years. As indicated in this testimony, there are many similarities between the Administration's policy and S. 1304. We look forward to working closely with the Committee to enact bipartisan legislation that will improve wetlands protection in the United States. Thank you. We will be happy to take any questions you may have at this time.

DEPARTMENT OF THE ARMY
OFFICE OF THE ASSISTANT SECRETARY
CIVIL WORKS
108 ARMY PENTAGON
WASHINGTON DC 20310-0108

REPLY TO
ATTENTION OF

28 OCT 1993

Honorable Bob Graham
Chairman
Subcommittee on Clean Water,
Fisheries and Wildlife
Committee on Environment and
Public Works
United States Senate
Washington, D. C. 20510-6175

Dear Mr. Chairman:

The purpose of this letter is to furnish information for the record for a question by Senator Kempthorne at the September 15, 1993, hearing on wetlands held by the Clean Water, Fisheries and Wildlife Subcommittee of the Senate Committee on Environment and Public Works.

Senator Kempthorne's question was:

"Does a system of strict liability make sense in a context where it is not always clear to a person that the land in question is or is not a wetland, particularly where criminal penalties, fines and jail terms are imposed in some cases where the Corps dispute has been over whether the land in question is a wetland?"

The following expanded answer is furnished for the record:

If what is meant by "strict liability" is that one can be found liable without fault, then the answer would be no. The Army Corps of Engineers and the Environmental Protection Agency (EPA) do not proceed with criminal penalties, fines and jail sentences where the facts indicate that the responsible party did not knowingly violate the law.

Because not everyone is able to recognize a wetland, the Corps and EPA have worked very hard to publicize the need for permits for work in these aquatic areas. Also, the Corps enforcement program has as a central tenet, a

policy of seeking voluntary compliance through restoration or measures determined necessary through the evaluation of an after-the-fact permit application.

When a violation occurs in a wetland subject to Federal jurisdiction, one of the first considerations is whether or not the violator had prior knowledge of regulatory requirements. This would be indicated by any past involvement of the violator in permitting actions or violations, or by the violator having received a cease and desist order from the Corps prior to taking additional actions that would require a permit. Another consideration is the willingness of the violator to correct or minimize any environmental damages that may have occurred as a result of the action in question. Only approximately 1 percent of the 6,000 or so annual enforcement actions handled by the Corps result in litigation. Of those few cases that do result in judicial action, a very small subset (less than 1 percent) result in criminal action.

Thank you for your interest in the Corps enforcement program. Should you have additional questions, do not hesitate to contact me or Mr. Michael Davis, Assistant for Regulatory Affairs at (703) 695-1376.

Sincerely,

G. Edward Dickey
Acting Assistant Secretary of the Army
(Civil Works)

Honorable Bob Graham
Chairman
Subcommittee on Clean Water,
Fisheries and Wildlife
Committee on Environment
and Public Works
House of Representatives
Washington, D. C. 20510-6175

Dear Mr. Chairman:

This is in reply to your letter of October 12, 1993, requesting information concerning Senator Lautenberg's questions related to cranberry production, following the September 15, 1993, hearing. A copy of the questions and answers as provided by the Army Corps of Engineers are enclosed.

We apologize for the delay in providing the response and thank you for your interest in this matter.

Sincerely,

G. Edward Dickey
Acting Assistant Secretary of the Army
(Civil Works)

Enclosure

DRAFT.**QUESTION 1:**

Why did EPA and the Corps determine that cranberry growing is a water dependent activity?

ANSWER 1:

EPA's Section 404(b)(1) Guidelines provide that an activity is considered water dependent if it requires access, or proximity to, or sitting within, a "special aquatic site" (e.g., wetlands) to fulfill its basic project purpose. Given that cranberries are a wetland plant and must be grown in wetlands or in areas altered to create a wetlands environment, EPA and the Corps believe it is reasonable to consider the construction of cranberry beds, including associated dikes and water control structures associated with dikes, to be a water dependent activity.

QUESTION 2:

Why did the Corps issue a nationwide permit for some cranberry growing in wetlands?

ANSWER 2:

Given the considerable interest from the cranberry growing industry in developing a nationwide permit for certain discharges of dredged or fill material associated with cranberry production activities, the Corps sought comments, in April 1991, on the feasibility of designing an appropriate nationwide permit for these discharges into waters of the United States. After receiving numerous comments, the Corps issued, in November 1991, a nationwide permit for certain cranberry production activities at existing cranberry operations. The nationwide permit is designed to ensure that only minimal impacts would occur as a result of activities authorized under the permit.

DRAFT**QUESTION 3:**

What are the positive wetland functions of cranberry wetlands and the habitat values and other environmental values of reservoirs, uncultivated wetlands, transition areas and uplands which accompany cranberry wetlands?

ANSWER 3:

Some positive values can be attributed to overall cranberry production operations, including the maintenance of open space, hydrological support and enhanced wildlife habitat. However, a determination of the environmental values associated with cranberry operations depends on the particular facts of each operation. The expansion of commercial cranberry beds, including development of associated structures such as reservoirs and irrigation ditches, generally involves eliminating the native wetland plant community and replacing it with a monoculture plant community. In addition, the area is usually ditched, filled, and diked to control the hydrology of the cranberry bed. Conversion of natural wetlands for cranberry cultivation, therefore, often reduces the diversity of habitat. In addition, there are concerns regarding the impact of cranberry operations on water quality, especially with regard to levels of phosphorus and pesticides in waters discharged from the cranberry fields.

QUESTIONS 4:

Have the water dependency determination and nationwide permit resulted in any expansion of cranberry growing in wetlands and, if so, how much?

ANSWER 4:

Although records regarding Section 404 permit applications are maintained by Corps districts we do not have specific numbers concerning cranberry applications. It is our understanding that only a limited number of cranberry growers have requested authorization to expand their existing operations since issuance of the nationwide permit.

DRAFT.**QUESTION 5.**

How can the regulatory process be changed to make decisions on the modest expansion of existing cranberry wetlands and mitigation efforts on a more timely basis?

ANSWER 5:

We believe our current efforts to promote mitigation banking and other programmatic streamlining will benefit cranberry growers. Cranberry growers may also work with individual Corps districts to develop regional permits that provide for minor actions that are larger than what has been provided for by the nationwide permit program.

**ANSWERS TO QUESTIONS FROM SENATOR LAUTENBERG
FOLLOWING THE SEPTEMBER 15, 1993 HEARING**

QUESTION 1:

Why did EPA and the Corps determine that cranberry growing is a water dependent activity?

ANSWER 1:

EPA's Section 404(b)(1) Guidelines provide that an activity is considered water dependent if it requires access, or proximity to, or siting within a "special aquatic site" (e.g., wetlands) to fulfill its basic project purpose. Because cranberries are a wetland plant and must be grown in wetlands or in areas altered to create a wetlands environment, EPA and the Corps believe it is reasonable to consider the construction of cranberry beds, including associated dikes and water control structures associated with dikes, to be a water-dependent activity.

QUESTION 2:

Why did the Corps of Engineers issue a nationwide permit for some cranberry growing in wetlands?

ANSWER 2:

Given the considerable interest from the cranberry growing industry in developing a nationwide permit for certain discharges of dredged or fill material associated with cranberry production activities, the Corps of Engineers sought comments, in April 1991, on the feasibility of designing an appropriate nationwide permit for these discharges in waters of the United States. After receiving numerous comments, the Corps issued, in November 1991, a nationwide permit for certain cranberry production activities. The nationwide permit is designed to ensure that only minimal impacts would occur as a result of activities authorized under the permit.

QUESTION 3:

What are the positive wetlands functions of cranberry wetlands and the habitat values and other environmental values of reservoirs, uncultivated wetlands, transition areas and uplands which accompany cranberry wetlands?

ANSWER 3:

Some positive values can be attributed to overall cranberry production operations, including the maintenance of open space, hydrological support and enhanced wildlife habitat. However, a determination of the environmental values associated with cranberry operations depends on the particular facts of each operation. The expansion of commercial cranberry beds, including development of associated structures such as reservoirs and irrigation ditches, generally involves eliminating the native wetland plant community and replacing it with a monoculture plant community. In addition, the area is usually ditched, filled, and diked to control the hydrology of the cranberry bed. Conversion of natural wetlands for cranberry cultivation, therefore, often reduces the diversity of habitat. In addition, there are concerns regarding the impact of cranberry operations on water quality, especially with regard to levels of phosphorous and pesticides in waters flowing from the cranberry fields.

QUESTION 4:

Have the water dependency determination and nationwide permit resulted in any expansion of cranberry growing in wetlands and, if so, how much?

ANSWER 4:

Although records regarding Section 404 permit applications are maintained by the Corps of Engineers, it is our understanding that only a limited number of cranberry growers have requested authorization to expand their operations since issuance of the nationwide permit.

QUESTION 5:

How can the regulatory process be changed to make decisions on the modest expansion of existing cranberry wetlands and mitigation efforts on a more timely basis?

ANSWER 5:

The Corps of Engineers has issued a nationwide permit for discharges associated the expansion of cranberry production operations that requires little, if any, delay or paperwork. We believe this nationwide permit provides an appropriate mechanism to facilitate limited expansions of existing cranberry operations. In addition, EPA and the Corps are working with States to address common concerns, as well as developing appropriate regional general permits.

TESTIMONY OF JOSEPH S. LARSON, PROFESSOR OF BIOLOGY, THE ENVIRONMENTAL INSTITUTE, UNIVERSITY OF MASSACHUSETTS AT AMHERST

FUNCTIONS AND VALUES OF WETLANDS OF THE EASTERN UNITED STATES

Mr. Chairman:

Thank you for the opportunity to provide scientific background on the functions and values of wetlands of the eastern United States. While wetlands make up only 5% of the land surface area of the conterminous United States, their importance to the health welfare and safety of our citizens is highly important. I am confident that your decision to involve wetland scientists early in your deliberations will strengthen the public policy recommendations of this committee.

Functions that Gave Rise to Wetland Regulation

As your hearings address the federal wetland program, it is useful to recall that wetland regulation and the permit process originated in Massachusetts some 14 years before the federal program was initiated. The initiative for wetland regulation did not come from government bureaucrats but from local towns that wanted to protect the functions of coastal marshes as nursery grounds for commercially valuable fish and shellfish that are important to their local economies. Inland towns soon petitioned the legislature to protect freshwater wetlands because they understood their values for reducing flood damage and in maintaining water supplies, both of which are critical to local economies. Today many eastern states have their own inland wetland regulatory programs and all have some form of coastal wetland regulation. Because the effect of wetland functions extend across state lines and some extend across international boundaries, the federal wetland program serves as an important complement to state and local programs.

General Character of Eastern Wetlands

The eastern United States is characterized by abundant rainfall evenly distributed over the year. As a result, eastern wetlands change less from year to year than wetlands in the semiarid and arid portions of the continent. The Atlantic and Gulf Coasts are geologically older than the Pacific coast and have well developed and large coastal wetlands, often behind barrier beaches and island chains. Large river systems and their sediments have formed major estuarine and coastal wetland systems. In the glaciated northern portion of the region freshwater wetlands range in size from less than one acre to many hundreds of acres. They are abundant and scattered over all the landscape, along rivers and the shores of large lakes. In the unglaciated portion of the Central Atlantic and Southeastern states, wetlands are primarily associated with small to large river systems and artificial reservoirs.

Major Functions and Values of Eastern Coastal Wetlands

Marine Fisheries

Tidal wetlands are essential to the commercial fishing industry of the Atlantic and Gulf coasts. Over two-thirds of the commercial fish and shellfish harvested in the entire United States are dependent on coastal wetlands as nursery areas and as a food source. The importance of this function is high on both a local and regional scale. For example, in 1980 the economic value of Chesapeake Bay seafood, sport-fishing and related activities was valued at about \$756 million. The same region annually produces about 90 percent of the striped bass harvest along the entire Atlantic coast. Louisiana's multi-million dollar commercial inshore shrimp fishery is directly proportional to the area of intertidal wetland. Losses of these wetlands are having a major effect on the fishing industry. The National Marine Fisheries Service has estimated annual fishery losses at \$208 million due to estuarine marsh losses from 1954 to 1978.

Storm Damage

When coastal storms move on-shore at low tide, coastal wetlands can provide a measure of storm buffering. But more importantly, and fully demonstrated in recent east coast hurricanes, coastal wetlands are areas of high risk for human habitation and development. Maintaining these wetlands in their natural state by prohibiting development avoids major individual and public financial losses.

Major Functions and Values of Eastern Freshwater Wetlands

Flood Control

Wetlands on the streams of the eastern and southeastern United States provide natural flood storage that reduces the height of flood crests at substantial savings to downstream landowners, cities and towns. Especially important in this function are the large wetlands positioned on the main stem of major watersheds. Loss of these wetlands by filling or draining increases flood damage below these sites. For example, in the Charles River near Boston 8,000 acres of preserved wetlands provide flood protection that prevents \$17 million in annual average flood damage. In Wisconsin, floods may be lowered by as much as 80% in watersheds that have many wetlands compared with those that have few wetlands. The bottomland hardwood forests of the Mississippi River stored floodwater equivalent to about 60 days' river discharge prior to human settlement and development. This storage capacity has been reduced to only about 12 days as a result of leveling the river and draining the floodplain. This is one of the reasons that flood damage along the lower Mississippi River is increasing.

Water Quality Maintenance

Inland wetlands act to capture sediment and to remove nutrients that can degrade downstream water quality. Recent research indicates that the many forested wetlands that line small headwater streams serve as the first line of defense in maintaining stream water quality, especially in terms of controlling the effects of nitrogen. From a water quality perspective, alterations of these wetlands merit much more careful consideration than they currently receive. Forested wetlands on the Delmarva Peninsula (Delaware, Maryland, Virginia) play an important role in reducing concentrations of nitrate in ground water and surface water. Recent studies of forested wetlands of the mid-Atlantic coastal plain suggest they have potential value for improving water quality with regard to phosphorous entering coastal streams.

The economic significance of the water quality maintenance role of wetlands can be estimated in terms of waste water treatment costs. For example, if the wetlands on streams leading into Chesapeake Bay were filled or drained it would cost over \$926 million to upgrade the sewage treatment plants in Maryland and Virginia to offset the effects of just the added nitrogen to the Bay. Swedish studies indicate that a wetland area 3/4 sq. mile in size reduces the amount of nitrogen leaking into adjacent waters by about 1,900 tons a year. If this were expressed in terms of equivalent waste water treatment costs each forested wetland acre would be providing a service worth over \$80,000 per year.

Groundwater Relations

Freshwater wetlands are frequently linked to groundwater aquifers. In the northeast and north central U.S. many wetlands are points where groundwater discharges to the surface, contributing to the flow of streams and rivers. In some cases wetlands may be points where surface water enters and recharges groundwater aquifers. In some wetlands both the discharge and recharge function may occur as groundwater levels rise and fall during different seasons of the year. In Massachusetts 750,000 people in 60 communities depend on municipal water supply wells that are drilled in or near large wetlands. Changes to wetlands that reduce the flow to groundwater or pollute the water can adversely effect affect the quantity and quality of both surface and underground water supplies.

Forestry and Fish

The bottomland hardwood forested wetlands of the Southeastern U.S. are highly productive forest sites. While the most valuable forest species were cut decades ago, many retain the potential for modern productive forest management, if they are maintained as forested wetlands. These same forested wetlands, in the spring floods, are critical fish feeding and breeding areas for bass, warmouth, hickory shad, blueback herring and edible crayfish. River swamps in Georgia produce over 1,300 pounds of fish per acre. Not only do these wetlands themselves provide seasonal fish habitat, they are the food source that supports the commercial fish and shellfish industry at locations like Apalachicola Bay, and the shrimp fishery off the wetland mangrove forests of south Florida.

General Significance of Wetland Wildlife Habitat

About 5,000 species of plants, 190 species of amphibians and a third of all bird species in the United States occur in wetlands. Wetlands provide a significant part

of the habitat of endangered or threatened plant and animal species. About 28% of the plant species and 50% of the animal species which are federally listed and endangered or threatened are wetland dependent.

International Treaties

The U.S. has an obligation to protect and manage wetlands under several international treaties. The several migratory bird treaties with Canada, Mexico, Russia and Japan require the signatory nations to maintain adequate breeding, migration and nesting habitat for migratory birds. These include not only ducks, geese and swans, but wading birds, shore birds and the hundreds of species of song birds that nest in forested wetlands. Under the Convention on Wetlands of International Importance (Ramsar), the U.S. has designated over a dozen sites as wetlands of international importance. The Ramsar Convention also obligates signatory nations to adopt policies that will promote wise use of all of its wetland resources.

In Conclusion:

In conclusion, Mr. Chairman, while wetlands have long been recognized as valuable habitat for wildlife, it is only in recent years that their importance to health, welfare and safety, and to local and regional economies, has been well documented. These functions have impacts and consequences that cross state and national boundaries. The federal government has an important role in maintaining and strengthening its wetland program under the Clean Water Act.

UNIVERSITY OF MASSACHUSETTS AT AMHERST

September 23, 1993

Senator Robert Graham, Chairman

Subcommittee on Clean Water, Fisheries, and Wildlife

United States Senate

SD-456 Dirksen Senate Office Building

Washington, D.C. 20510-6175

Dear Senator Graham:

I would like to add the following remarks to my testimony of September 15, 1993 regarding the Subcommittee's hearing on wetlands.

Federal Role in Wetland Regulation

The appropriate federal role in wetland regulation should be spelled out in the Clean Water Act. In drafting that section, I would recommend that our international multilateral obligations be recognized by reference first to the "wise use" obligation, accepted by the United States, of the Convention on Wetlands of International Importance (Ramsar). This clearly spells out the obligation of signatory nations to develop policies that promote wise use of all wetlands within their national territories. This obligation refers to essentially all wetland functions and is clearly a federal responsibility. Secondly, I would recommend reference to our obligation to maintain migratory bird habitat under the several Migratory Bird Treaties and the special wetlands covered by the World Heritage Convention.

With respect to federal responsibilities on the bilateral international level, the federal government has the lead responsibility with respect to wetlands that are part of international river systems, underground aquifers, and wetlands that support anadromous fish that use international waters. "There may be treaties with Canada and Mexico covering specific rivers, but even in the absence of these, I would suggest that the need for a federal lead is undisputed. The federal government also has a lead interstate responsibility on wetlands that involve interstate rivers, aquifers, migratory wildlife, and fish that cross state lines.

The above composes a large portion of our national territory. It is a strong argument for federal assurance of standards and consistency much as have been established for surface water quality for the entire nation. Few states have the base for supporting a comprehensive research program, and there is need for federal sponsorship in this regard as well.

Role for the U.S. Soil Conservation Service

I support providing a role for the SCS in the section 404 program, but the Administration's proposal that SCS be responsible for delineation on all "agricultural lands" is premature. First, it is not clear what the term "agricultural lands" is meant to embrace: cropland, all grazing lands, all forest lands?

Secondly, and perhaps more importantly, the SCS (unlike the EPA, Corps of Engineers, U.S. Fish and Wildlife Service, and National Marine Fisheries Service) brings to the program only a tiny scientific staff trained in wetland ecology or management. Nor does SCS have a research component. I am very much afraid that if the SCS is given the delineation responsibility we will be inviting a period of litigation in federal courts much as was experienced when the Corps of Engineers first took responsibility for the 404 program. The SCS administration has long had a role of assistance that has made friends for the agency in the farming community, much as the Corps had developed friends in the construction, flood control, and navigation community. The 404 program is a regulatory program, and the delineation aspect, in particular, wins no friends. It took the U.S. Supreme Court to force the Corps administration to accept the Congressional direction of the 404 program. I am very much afraid that the SCS administration will be just as human and is much less equipped as an organization to handle a major role at the outset.

I would recommend that SCS be first brought into the 404 program in the same kind of advisory and consultative role in which the U.S. Fish and Wildlife Service and the National Marine Fisheries Service now perform. The purpose would be to bring in SCS in a step-by-step fashion to give time to develop an appropriate role and to determine how much in the way of added staff and funding are needed in order to take on more responsibility.

Sincerely,
Professor and Director

TESTIMONY OF DAVID J. COOPER, SENIOR RESEARCH SCIENTIST, DEPARTMENT OF FISHERY AND WILDLIFE BIOLOGY, COLORADO STATE UNIVERSITY

Functions and Values of Wetlands in the Western United States

Mr. Chairman:

The western United States is often overlooked in discussions of wetlands, yet the West contains large and important wetland complexes. Western wetlands are critical habitat for waterfowl, shorebirds and other migratory birds that is of international importance, they perform water quality and flood water retention functions that are of interstate importance, and vital economic value to every state and region. Because much of the West is arid or semi-arid it is critical to consider these distinctive wetlands in formulating wetland regulation programs and policies for the United States. In most western states wetlands comprise less than 1-3% of the total land area, and in Nevada only 0.3% of the land is wetland. I appreciate the opportunity to participate in this hearing and provide you with scientific information and perspectives on the functions of wetlands in the western United States.

General Character of Western Wetlands

The western lower 48 United States is a vast region of high mountains, intermountain basins, grasslands, deserts, agricultural lands and the Pacific Ocean coast. Within this region precipitation is unevenly distributed geographically, annually, and seasonally. The west coast, Great Basin and most of the Rocky Mountains receive largely winter precipitation, the Great Plains receive largely spring and early summer rain, and rain comes in the southwest during mid to late summer. Because precipitation is seasonal many streams and basins are wet seasonally and may be dry at other times of the year. In addition, year to year variability in the total amount of precipitation received is tremendous with drought as well as wet cycles being characteristic. Where water has been abundant wetlands have occurred, yet many times nonwetland uses for this water have taken priority and the water has been diverted elsewhere, or seasonally there has been too much water making other land uses, such as farming, impossible, and wetlands were drained.

A number of different wetland types occur in the West, each a result of hydrological patterns and processes interacting with distinct landscape types. *Riparian wetlands* occur along floodplains formed by seasonal runoff patterns. Riparian wetland functions change from high to low elevation as the size of stream and power of the water increases and as vegetation changes from herbaceous species to willows, to alder or conifer forests, to cottonwood or mesquite forests. Wetlands in landscape depressions or *basins* are fundamentally different from those occurring along streams because they lack the power of moving water. Basin complexes have a number of different names reflecting their geographic location and origin. Included are prairie potholes (northern prairies), playas (southern prairies and intermountain

basins) and vernal pools (California and the desert southwest). These basins support fresh or saline marshes. In mountainous regions snowmelt feeds groundwater systems creating innumerable springs that range in size up to hundreds of acres. At the most constant springs decomposition of plant roots and leaves is slow and organic matter accumulates to form *peatland* ecosystems similar to those of the far north. In areas where the groundwater table is close to the soil surface but the ground is not wet all summer *wet meadows* dominated largely by rushes and sedges are common and may cover tens of thousands of acres. In certain areas wet meadows have been created by irrigation water diverted from streams or pumped from underground aquifers.

It is important to stress that many of the most valuable wetland types in the West are not wet at all seasons. You might ask how can wetlands that are dry for parts of the year be so valuable? The answer is that seasonal drying increases their value for many functions such as food chain support and flood water retention. It is not possible to say that wetlands in one region of the United States are more valuable than wetlands in another region. Small seasonally wet wetlands in an arid region may be just as valuable to that area as larger wetlands in a humid region which are wet all year. All wetlands provide important functions for their region. Local and regional planning efforts can determine which wetlands are most important to that region.

Functions and Values of Western Inland Wetlands

Water Quality Maintenance and Improvement

Wetlands can improve and maintain water quality in several different ways. Sediment is one of the most important pollutants in the west because so much sediment is generated from agricultural and other sparsely or seasonally vegetated lands and this sediment may carry excessive nutrients, metals, pesticides and other pollutants. Many wetlands trap and retain sediment thus, removing pollutants from the water column. Once sediment is trapped, it must be retained in the wetland for the function to be realized. This requires maintaining the basins integrity (no draining) and vegetation which stabilizes the soils along floodplains. In Wisconsin, sediment yield from watersheds is directly correlated with the area of wetlands in that watershed—the more wetlands the less sediment.

In the mountainous west heavy metal pollution of surface waters from mine adits and tailings piles is a serious problem. Wetlands, particularly peat lands, provide an oxygen poor and organic rich soil environment supporting microbes that can remove many metals from solution and sequester them. My studies indicate that wetland soils in Colorado can be as high as 10% to 30% metal by weight! Heavy metals removed include not just Zn and Cu but also moderate or high concentrations of uranium which the wetland removes from groundwater. The regional economic value of metal removal is not known but it is known that wetlands function only when their hydrologic regime and vegetation are intact.

Surface water bodies in the West, such as Lake Tahoe, California + Nevada may be extremely clear and clean due to the purity of waters. Lake Tahoe's water source is snowmelt which contains high nitrate concentrations received with precipitation. Nitrates flushed into the lake would degrade water quality, however up to 99% of the nitrate received from precipitation is removed by wetlands surrounding Lake Tahoe maintaining its water quality. Wetlands naturally are so efficient at the removal of many nitrogen compounds that municipalities from Minot, North Dakota to Arcata, California have built artificial wetlands to treat municipal waste water.

Flood Water Retention

Many basin wetlands can hold large volumes of water for short periods of time and are provide the greatest detention function when they are largely isolated. This function is diminished or lost completely when a basin is drained. The function comes not just from total water holding capacity, but also from desynchronization of flood waters so that water is held for differing lengths of time in different basins. Basin wetlands in the upper Mississippi River valley have sustained 80% to 100% wetland loss, largely by drainage, and the flood flow alteration function has been destroyed.

Researchers in Wisconsin have found that flood flows may be as much as 80% lower in watersheds containing 40% of their area as lakes and wetlands than watersheds with little or no wetland area. Nearly 50% of the flood peak reduction results from the first 5% of lakes and wetlands in the watershed.

Lawn Lake Dam, located in Rocky Mountain National Park, was built as a water storage reservoir for the town of Loveland, Colorado. In 1982 the dam failed sending a wall of water down Roaring River toward the town of Estes Park. Luckily a large

wetland basin, Horseshoe Park, occurs Just upstream from Estes Park, where the water velocity slowed from 9.1 to 2.1 miles per hour due to retention in the basin and the town was spared the brunt of the floods destructive force.

Water Storage

In spring, the melting mountain snowpack increases stream flows raising water tables in seasonally dry floodplains. This groundwater is temporarily stored and later released when stream flows are at their minimum. This groundwater discharge maintains stream base flows for fish and municipal and agricultural use downstream. In the Gunnison River basin in central Colorado more than 1/2 of an acre foot of water per acre of floodplain can be stored in soils for release in the dry months of late summer. This adds up to thousands of acre feet of water storage and yield seasonally, the value of which is very high. This function is destroyed by drainage projects, stream channelization and flow regulation.

Riparian restoration projects in the West have reduced livestock grazing pressure and repaired downcut stream channels facilitating vegetation recovery on many floodplains. This rejuvenated vegetation accumulates sediment and increases floodplain water storage which in several instances has changed streams from intermittent to perennially flowing! The importance of vegetation interacting with the stream to stabilize sediment and store water cannot be overemphasized.

Fisheries Support

The Rocky Mountains support famous cold water trout fisheries. Trout inhabit undercut banks in small streams, pools in larger rivers and feed on aquatic insects produced in the stream. These aquatic insects feed largely on leaves, twigs and other organic matter that falls from riparian vegetation into the stream. Riparian wetland vegetation feeds the stream insects that trout depend upon. In addition, the woody roots of willows, alders and other shrubs and trees stabilize the streambank that is habitat for fish. The riparian trees and shrubs are important while they are alive for their leaf input, and they are Just as important when they die. Trees fall into streams creating pools that create habitat. Thus, the quality of a trout streams fishery can many times be measured by its adjacent riparian wetlands. Trout fishermen in every Rocky Mountain state spend several hundred million dollars each year boosting the economy of the West.

Pacific salmon, particularly Coho, over winter in off channel or tidal freshwater wetlands and Juvenile fishes feed in riparian wetlands.

The Colorado River system is home to many endemic fishes, including razorback suckers and Colorado River squawfish. Historically spring floods would flush larval fishes from the stream channel into adjacent riparian wetlands where they would feed and be protected from the strong current and predators. The fish move back to the stream later that year, or the next year following the flood surge. Today, almost all tributaries of the Colorado River are controlled, floods rarely occur and wetlands have been dried up. Several of these fish species are nearly extinct because of this decoupling of streams and floodplains.

Bank Stabilization

Western riparian ecosystems are generally linear with narrow floodplains. The streambanks in these ecosystems provide essential functions for protecting the physical, chemical and biological character of adjacent waters. Woody plants, such as cottonwood, alder and willow provide essential bank stability which reduces erosion. Stable banks maintain water quality (by retaining sediment), and instream habitat by providing wood, litter and shade as well as bank structure. Riparian vegetation can change many braided stream channels which are moving large sediment loads into meandering stream channels which will retain sediment on their floodplains. Vegetation removal or degradation, stream channel downcutting, drainage ditches, or even diking which eliminates floods can reduce bank stability and lead to surface water degradation.

Migratory Bird Habitat

The Central and Mississippi Flyways, extending from the Gulf of Mexico through the Great Plains of the United States and into Canada support one of the worlds most important populations of migratory waterfowl, shorebirds and cranes. Approximately 60% of all North American waterfowl (ducks and geese) and 75% of our most abundant duck, the mallard, winter in the lower Mississippi River valley, the Gulf coast and southern prairie states and in spring move north to find feeding and nesting sites on the prairies, although a few species go north to the arctic. It is important to recognize that these birds utilize landscapes at a continental scale

moving from wetlands on the Gulf Coast to the Texas playas, the Rainwater Basin of Nebraska, prairie potholes on the northern prairies and back. These wetlands are linked into one giant system. Prairie marshes provide the most important habitat for waterfowl and today's very low waterfowl populations may be explained by the fact that many prairie states, such as Iowa, have sustained tremendous wet land loss.

Waterfowl and other water birds provide an important economic stimulus for this region. Nearly 40% of all hunting occurs in wetlands and hunters spend hundred of million of dollars each year. Of Americans who enjoyed nonconsumptive wildlife associated recreation activities in 1991 nearly 40% did so in wetlands, a total of 11.7 million people. More than 80,000 people visit the Platte River in Nebraska each year to watch Sand Hill Cranes, bringing over \$15 million to the local economy. Neotropical migrant birds use riparian vegetation in the West as these are the primary deciduous forest and shrubland types.

Forage and Farming

Wetlands provide one of the most important sources of forage for livestock and wildlife in the western U.S. Most of the West is semi-arid and hay is grown primarily in high water table areas, most of which are wetlands. Almost every wetland that can be hayed or grazed is utilized and wetland hay is valued at \$30 to \$60 per ton with yields of 2-5 tons per acre, making this valuable agricultural land. In some areas wetlands have been created by the irrigation of formerly dry lands. These wetlands have many of the same functions as natural wetlands (eg. habitat and water quality improvement) and it is important to recognize that many irrigation activities were accomplished by diverting water from streams which has resulted in the loss of riparian wetlands.

The administration has proposed that 53 million acres of prior converted croplands' be no longer subject to section 404 regulation. I suggest that a watershed approach be used in agricultural areas with large wetland losses to identify critical wetland complexes for restoration to increase the landscapes function for retaining flood water, water quality improvement and habitat.

Hydrologic Functions

We know very little about which western wetlands function in ground water recharge. Prairie potholes are known to recharge local groundwater tables raise local water tables and may help recharge agricultural soil water. Many ephemeral streams in Arizona and Utah are known to recharge deep ground water aquifers.

Many western wetlands, particularly peatlands and wet meadows, tend to occur at ground water discharge sites. These wetlands provide important water quality treatment prior to this water entering surface water bodies.

Functions and Values of Western Coastal Wetlands

The Pacific Coast of the United States is a dynamic, steep and rocky coast. Most wetlands occur at the mouths of small streams, or in the relatively few large bays along the coast. The largest estuary on the west coast is San Francisco Bay, where 92% of the wetlands have been destroyed. The remaining wetlands provide important habitat and water quality functions. Coastal wetlands contain a great diversity of ecosystems including tidal marshes, tidal mudflats, eel grass beds and kelp forests, ranging from salt to brackish to nearly fresh water.

Migratory bird habitat and marine fisheries support are two of the most important functions of these wetlands. Pacific coastal salt marshes provide critical habitat for migratory waterfowl, as well as for adult and juvenile fishes of many species including herring and anchovy. Coho salmon are known to use tidal freshwater wetlands in winter. Shorebirds, clams, crabs, turbot and many other species use tidal mudflats.

TESTIMONY OF HON. DON EDWARDS, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mr. Chairman, thank you for giving us the opportunity to testify today. We appreciate the work that this committee has done toward resolving the complex issue of how best to protect the nation's wetlands.

We would like to encourage the members of this committee to continue in their quest to strengthen federal wetlands protection efforts and provide greater certainty, consistency and flexibility to the regulatory program.

We believe that the fundamental building blocks to achieve these goals exist within the framework of the current program. A radical overhaul of the system is not needed. Rather, we support strategic improvements to key portions of the law.

The legislation that we have introduced, the Wetlands Reform Act, takes a balanced and realistic approach to this issue. We worked very hard to offer legislation that would rectify the serious shortcomings of the current system while also improving protections for wetlands. Our bill recognizes the special needs of farmers and small landowners, and seeks to move away from a strict regulatory approach to protecting wetlands.

To slow the loss of wetlands, our bill would:

- Amend the Clean Water Act to explicitly include a provision covering the protection of wetlands
- Expand the number of activities covered under the Act to include all that are harmful to wetlands
- Require better tracking and reporting on the overall impact of the permit program
- Direct more personnel and resources to the Army Corps of Engineers and the Environmental Protection Agency to allow these agencies to effectively carry out their responsibilities
- Improve the training and certification of field staff doing wetlands delineations
- Improve education and outreach programs on wetlands

The committee deserves praise for demonstrating its commitment to protecting wetlands by including many of these provisions in S. 1304. We would like to emphasize the merits of strengthening the role of the Fish and Wildlife Service and the National Marine Fisheries Service in the permit process. These agencies will help insure that resource matters are given consideration in permitting decisions when necessary.

Much of the frustration and problems experienced by those seeking to comply with wetlands regulations arises from the lack of consistency in the system, delays in decisions concerning delineations and permit applications, and too much emphasis on a regulatory approach to protecting wetlands. Our bill is designed to address these serious problems.

The definition of what is a wetland and the criteria used in delineating wetland uses must be scientifically valid and workable. The National Academy of Sciences study now underway is intended to address this issue, and when changes are made to the wetlands delineation manual, the study findings should be taken into consideration. We believe all the resource agencies should use equivalent definitions of wetlands for regulatory purposes to maintain consistency and eliminate confusion. All field staff must also be given ample and appropriate training for applying field delineation techniques.

Permit processing must be streamlined and improved to provide landowners with greater certainty and predictability. Because small landowners cannot endure long delays without economic difficulty, H.R. 350 would establish a "Fast Track Team" to process permits which would affect wetlands of one acre or less within a 60 day period.

Farmers should continue to enjoy special exemptions for agricultural uses of wetlands. H.R. 350 reinforces exemptions for normal, ongoing farming practices. In addition, it clarifies that artificial wetlands and abandoned cropland should be free from regulation.

We need to take greater advantage of the benefits that can be realized from incentive based conservation programs for wetlands. For example, the Wetlands Reserve Program, which offers direct payments and cost-sharing assistance to farmers who put their wetlands into protected easements and conduct restorations on those lands, has shown much promise as a successful incentive program. To further expand on this concept, H.R. 350 includes a section of tax incentives that will make it financially more attractive for land to be donated to qualified conservation organizations, or for activities on wetlands to be limited to compatible uses.

We are pleased that both this committee and the Administration have chosen to focus attention on resolving the complex issue of wetlands. We would like to raise certain points with regard to the approach on wetlands so far taken by the committee and the Administration.

First of all, we are particularly concerned with the amount of emphasis that has been placed on the role of mitigation banking. While we agree that mitigation can be a useful tool to inject greater flexibility into the regulatory process, we feel strongly that it must be viewed with caution.

We must not forget that when wetlands are destroyed, they, together with their unique functions and values, are lost forever. Rarely do replacement wetlands per-

form as many or even the same functions as the natural wetlands they replace. Our past record on mitigation attempts has been less than impressive, and there are doubts as to whether the science of wetlands creation and restoration is sophisticated enough to make this a safe approach.

In further exploring the potential value of mitigation, we should proceed with great care. Our legislation contains a wetlands restoration pilot program to allow the best methods and techniques for restoration to be developed and examined. It would also develop a means of evaluating the success of such projects. We encourage the members of this committee to support such a pilot program to help improve our ability to be successful in such endeavors.

We support the Baucus/Chafee approach of limiting mitigation to the restoration, and not the creation, of wetlands. We also support keeping restoration projects in the same watershed as the impacted wetlands. Another key provision that must be required is the long-term monitoring of mitigation projects to insure that they are carried out successfully. Along these lines, we feel that mitigation should be required before a permit is issued.

A second issue of concern are proposals to establish an administrative appeals process on permit decisions. We agree that landowners should not have to resort to the judicial system as their only means of appealing decisions. However, we are very concerned that, unlike the Baucus/Chafee bill, the Administration has proposed a system that would allow for appeals to be made on permit denials only, but not for permit issuances. The appeal must be open to all interested parties, such as neighboring and downstream landowners, who are affected by the permit decision. We support the Baucus/Chafee appeals system that would limit appeals to those individuals who participated in the public comment process for the permit application.

Finally, we would like to flag a provision included under the watershed management approach proposed by this committee and the Administration. As you know, we believe permit processing must be streamlined to eliminate unnecessary and costly delays. Certainly for small landowners, a lengthy permit review can make the system prohibitively expensive. That is why our legislation creates a "Fast Track" for minor permits. However, the proposals to expedite all permit decisions should not be applied too rigidly. In cases where the potential impact on wetlands is high, greater flexibility must be put in place to allow scientific analysis and review by resource agencies and the public to continue beyond 90 days if necessary.

Please keep in mind that in the drive to inject greater flexibility into the permit process, wetlands losses must not be accelerated. The policy goal of no net loss of wetlands has been widely embraced, but it is meaningless if our policy decisions do nothing to slow and eventually reverse the erosion of our wetlands base.

We commend the members of this committee for working to arrive at a consensus on this important environmental matter. Because it seeks to install flexibility into the system while also strengthening safeguards to protect wetlands, we hope you will consider the approach proposed by the Wetlands Reform Act very seriously as you finalize your legislation on wetlands.

TESTIMONY OF HON. FRANK H. MURKOWSKI, U.S. SENATOR FROM THE STATE OF ALASKA

The Baucus/Chafee Wetlands Bill, S. 1304:

- Thank you for this opportunity to testify on S. 1304.
- I appreciate the work of the Chairman and ranking member of this committee to attempt to conserve wetlands in the United States and to Improve wetlands regulation.
- However, I am concerned that some of the provisions of S. 1304 will not solve our wetlands problems in Alaska, and may in fact, make them worse.
- S. 1304 would continue "no-net-loss" plus set a long-term goal of "increasing quality and quantity of wetlands".
- No-net-less is an unnecessarily restrictive goal in Alaska. And increasing wetlands in a state that has 180 million acres of pristine wetlands doesn't make much sense.
- S. 1304 expands the definition of fill and creates additional activities in that would be regulated in wetlands such as dredging, draining, and building on pilings.
- The bill does not solve the problem of definition of wetlands or account for wide variations in abundance, function, and value. It does not account for permafrost wetlands.

- Without modification, S. 1304 will mean more of the same for Alaska—more onerous federal conditions, more compensatory mitigation, more delays. It will also mean less community expansion, less community facilities constructed, and less resource development in Alaska.

President's proposed wetlands policy:

- The President's new wetlands policy is similar to S. 1304, but it contains four significant errors which I would like to identify.
 1. The policy assumes that the wetlands regulatory program is working fine in Alaska. It is not. The President's task force on wetlands received considerable testimony from the Alaska Congressional delegation, residents of Alaska, the Native community, industry, and the Governor that all pointed out serious problems with the wetlands program.
 2. The policy rejects the "Alaska 1% rule" on the grounds that the rule would de-regulate wetlands development and 1.5 million acres of wetlands would be destroyed. In fact, the 1% rule would only remove the requirement for compensatory mitigation. Other mitigation measures such as avoidance and minimization would remain in place. Alaska's wetlands would remain regulated by the Clean Water Act and all other existing Federal, State, and local law.
 3. The policy claims that potentially all of Alaska's coastal wetlands would be destroyed if the 1% rule were adopted. This is not true. Alaska has a very effective coastal zone management program developed in accordance with the federal Coastal Zone Management Act. The CZM program was developed specifically to protect the valuable resources of the coastal zone and sets more rigorous standards for approval than the 404 program alone.
 4. And finally, the President's policy claims that if the 1% rule were adopted, it would hinder management efforts of threatened and endangered species. Again, this is not true. Nothing about exempting up to 1% of Alaska wetlands from compensatory wetlands would interfere with any management activities required by the very powerful Endangered Species Act.
- Finding a reasonable policy to allow development of a small percent of Alaska's wetlands does not equate to total wetlands destruction.

Alaska has vast wetlands and requires a different regulatory approach:

- Alaska contains 170 million acres of wetlands, Equal to the size of Texas. Alaska has 65 million acres more wetlands than all the wetlands in the lower 48 combined.
- In Alaska, if you can find land to build on, it's a wetland. Wetlands cover 45% of the surface area of the state. 74% of the non-mountainous areas of the state are wetland. On the North Slope 99% of the surface is wetland.
- Alaska is completely saturated with wetlands!!
- Many of Alaska's wetlands are permafrost wetlands of lesser value. In areas with an abundance of wetlands, uplands are often the higher value habitat.

Alaska has had very little wetlands loss.

- Alaska doesn't have a wetlands loss problem. Our wetlands are not in danger.
- Alaska wetlands have been virtually untouched by development. Total wetlands lost in Alaska is about 80,000 acres, or less than 1%, over the last 126 years.
- No other state in the nation has over 99% of its original wetlands. In fact, no other state even comes close.
- New Jersey, the next closest state has lost 9% of its wetlands. That's 90 times greater percentage loss than Alaska!! California has lost 91% of its wetlands. That's nearly 1,000 times greater percentage loss than Alaska. The national average is 53% that's 500 times greater loss than Alaska.
- At the current rate of development it would take 250 years for Alaska to develop even 1% of its wetlands.
- Compare this with the lower 48 where over 50% of the original wetlands have been lost. The Lower 48 loses over 275,000 acres per year. That's three times more acres lost in one year, than Alaska has ever lost!
- Alaska already contributes greatly to the nation's wetland resource and should not bear the burden of unnecessary wetland regulations. We do our fair share. 68 million acres of wetlands are already protected—within federal and state conservation units. These will never be developed.

The wetlands problem in Alaska:

- The current wetlands program as regulated by section 404 of the Clean Water Act simply hasn't worked in Alaska.

- Property owners in Alaska regularly experience ridiculous bureaucratic nightmares and senseless project delays. Communities cannot grow, houses cannot be built, community facilities basic for health, education, safety, and sanitation cannot be built.
- The Corps of Engineers claim they rarely deny wetlands permits. Technically that may be true. But what the Corps does, is require unreasonable permit conditioning and endlessly request additional information. Very few applicants are in the position to persevere through this onerous process. The effect is the same. Delay is the most insidious form of denial.

The current wetlands program violates the spirit of ANCSA:

- The Alaska Native Claim Settlement Act of 1971 (ANCSA) gave Native Alaskans the right to select certain lands in Alaska in exchange for extinguishing their aboriginal rights to the land. The settlement was to provide for the "real economic needs of the Alaska Natives".
- Unfortunately, the current wetlands program prevents the Natives from developing their own selected lands.

The current wetlands program violates the spirit of ANILCA:

- Land not placed in conservation units was intended to be available for development.
- Development of Alaska's abundant natural resources is the economic promise of statehood. Both the state and the nation are being deprived of the benefits of development.
- It is not right to solve the Lower 48 wetland loss problem in Alaska. Alaska should not be held hostage by the problems of the lower 48.

Wetlands legislation should recognize:

1. Wetlands vary in abundance, function, and value. Alaska has 170 million acres of wetlands, much of which is abundant, low value, permafrost wetland.
2. Regulation should be based on the extent and proportional loss of wetlands. Alaska has nearly all its original wetlands intact.
3. Credit should be given for wetlands already protected. Alaska has 68 million acres of wetlands (40%) protected in federal and state conservation units.
4. Permitting should be simplified and streamlined.
5. General permits and local government wetlands planning should be encouraged.
6. Regulations should recognize and protect the property rights of private property owners.
7. Regulations should not conflict with the economic goals of ANCSA and the multiple use promise of ANILCA.
8. States should be able to assume the federal wetlands program and manage it in a way that makes sense in that state.

Alaska needs a wetland policy that allows the continued responsible development of our abundant natural resources. Alaska has demonstrated the ability to balance environmental protection with resource development.

Solve the wetlands loss problem where there is a problem.

TESTIMONY

SUBMITTED TO

UNITED STATES SENATE

COMMITTEE ON THE ENVIRONMENT AND PUBLIC WORKS

SUBCOMMITTEE ON CLEAN WATER, FISHERIES AND WILDLIFE

ON BEHALF OF

THE ASSOCIATION OF STATE WETLAND MANAGERS, INC.

AND

THE WISCONSIN DEPARTMENT OF NATURAL RESOURCES

BY

PAUL SCOTT HAUSMANN

CHAIR, ASSOCIATION OF STATE WETLAND MANAGERS

CHIEF OF WATER REGULATION, WI DEPARTMENT OF NATURAL RESOURCES

The Association of State
Wetland Managers, Inc.
Box 2463
Berne, N.Y. 12023-9746

Madison, Wisconsin 53707
TELEPHONE 608-266-2621
TELEFAX 608-267-3579
TDD 608-267-6897

Thank you for the opportunity to present the following comments on S. 1304 on behalf of the Association of State Wetland Managers and the Wisconsin Department of Natural Resources.

The Association of State Wetland Managers is an organization composed of professionals from local, state and federal agencies and private consultants which has as its primary interest the protection and wise management of the nation's wetlands. Our comments and recommendations are based on over 16 studies, workshops and symposia conducted by the Association since 1989 which collectively involved several thousand state and local wetland managers, wetland scientists, federal agency staff, developers and other participants (list attached).

Wisconsin has a well founded reputation and tradition of environmental protection. Wisconsin has strongly supported the Clean Water Act and the s. 404 program believing that the program complements our state and local regulations and provides comprehensive protection of Wisconsin's and the nation's valuable water resources.

We believe that s. 1304 is the first serious bill to build upon and address deficiencies in the Section 404 program. The bill will do much to implement the recommendations of the National Governor's Association and the concepts put forth by the Association. It is also consistent with the ideas and recommendations of the scientific and technical communities which we represent. Both the Association and Wisconsin strongly support wetland protection and restoration. However we have also recognized that wetland protection and restoration require the understanding and support of public and private landowners and the protection of the quality and quantity of water supplies to wetlands through watershed approaches.

We recognize that the bill raises issues within the environmental community with regard to general permits, enhanced state and local roles, advanced planning, prior converted croplands, mitigation banks and perhaps other matters. We believe that these topics must be approached with great care, but we also believe that after 21 years with a Section 404 program which really does not protect many wetlands it is time to try some new partnership approaches and to better address landowner needs. These are keys to actual protection and restoration of wetland ecosystems.

Today, in addition to providing general support for S. 1304, I would like to briefly address seven areas of this legislation and close with some thoughts on wetlands, this bill and flood damage reduction:

1. Programmatic General Permits - The specific authorization in S. 1304 for state and local programmatic permits clarifies ambiguities about general permits under current regulations. The Association strongly supports the use of programmatic permits where the state or local program meets or exceeds federal regulatory standards. My state, Wisconsin, is now entering its eleventh year with a state program general permit that has reduced regulatory duplication while helping to provide greater certainty, predictability, fairness, and flexibility for our citizens.
2. State Conservation Plans - This is a very positive proactive approach that can initiate useful changes to managing wetland resources, especially when combined with Wetlands and Watershed Management Plans.
3. Wetlands and Watershed Management Plans - For reasons discussed in a brief paper attached to the testimony, advance planning in a watershed context of the sort encouraged by this bill is needed to help resolve many of the severe problems and conflicts in the protection and management of freshwater and estuarine wetlands now facing the federal agencies, states and local governments. Such advance planning is needed to meet private and public landowner and developer needs for more certainty, predictability, flexibility and lower costs in wetland regulation.
4. 90 Day Decision Deadlines - While the Association supports timely decision making, the inadequacy of many of the permit applications presently submitted raises some concerns on how this provision of S. 1304 will be implemented. The Corps is limited by regulation on what they can request from an applicant prior to issuing a public notice. We would strongly recommend that language be added to make certain that the 90 day time clock does not start running until adequate information to assess the impacts of the proposed action is in hand.
5. Agricultural Activities - We support the intent of this section of the bill. However, we believe that the existing abandonment provisions for prior converted wetlands should be maintained. Also the ability of the Soil Conservation Service to carry out this mandate in terms of resources and expertise is questionable. Training of SCS personnel at the county level is absolutely critical.
6. Mitigation Banking - The Association supports the requirements for the establishment, use, maintenance and oversight of banks relying on practicable and scientifically sound methods. However the bill does not, but should, include the explicit sequencing (avoidance, minimization, and then mitigation) language, as now found in the 404(b)(1) guidelines as recommended by the National Governor's Association and the Association. This is critical for the appropriate use of mitigation banks. Also, we question the creation of wetlands as an effective mitigation technique.
7. Funding - The funding mechanisms provided in the bill include section 104, 106(h), 205(j), 319(e) and 604(b). These funds have become increasingly competitive as they are used to support multiple Clean Water Act programs. Congress must be willing to financially support the excellent intentions of this bill.

The Association and the Association of State Floodplain Managers recently conducted the first of two meetings in St Louis on Post Flood Recovery and Restoration of Mississippi River Floodplains and Wetlands. The second meeting will be September 27-29 and I invite you and your staff to attend. Many of the provisions of this bill- state wetland plans, watershed management plans, programmatic general permits and mitigation banking - will be important tools to accelerate the restoration and protection of open, wetland, bottomland, backwater and floodplains area important to water retention and slow release of floodwater.

In summary, we believe this bill will help create an effective national wetland regulatory program that is integrated with other Clean Water Act goals and programs. It will achieve this by creating new federal, state and local partnerships to evaluate, plan and regulate wetlands on a watershed basis as part of broader water resources systems.

BASIS FOR RECOMMENDATIONS: RECENT MEETINGS OF THE ASSOCIATION OF STATE WETLAND MANAGERS

July 1989 - June 1993

International Symposium: Wetlands and River Corridor Management, July 1989.

This meeting held in Charleston, South Carolina, was attended by 380, and included representatives from 20 countries. Presentations addressed river and stream corridor management, including the adjacent riparian and estuarine wetlands, from a natural systems protection and restoration perspective. A proceedings book prepared.

Implementing No Net Loss: Issues and Options for the States, November 1989.

This Washington, D.C. meeting drew approximately 200 individuals from 45 states. A variety of concerns about the no net loss goal were raised, and many specific recommendations for implementation were made by attendees.

Translating No Net Loss Into Regulations, November 1989.

The Association cooperated on this meeting that was conducted and hosted by the New Hampshire Wetlands Board in Manchester, New Hampshire. About 200 people attended.

No Net Loss and the Role of Restoration/Creation, April 1990.

This Association meeting was hosted by the U.S. Army Waterways Experiment Station in Jackson, Mississippi. About 430 participants. Many of the papers presented are in the new Island Press/E.P.A. publication: *Wetland Creation and Restoration: Status of the Science* edited by Jon Kautler, ASWPM, and Mary Kenneth, E.P.A.

Urban Stream and River Corridors: A Multiobjective Management Symposium, April 1990.

The Portland (Oregon) Audubon Society presented this meeting; the Association cooperated. Topics addressed included multi-objective management and restoration of urban streams, river corridors, and wetlands. There were 680 attendees and speakers.

International Symposium: Wetlands of the Great Lakes, May 1990.

Approximately 200 attended this meeting in Niagara Falls, New York. Half of the speakers and attendees were from the U.S., and half from Canada. The focus of the program was on techniques to better protect and restore Great Lakes Wetlands in both the U.S. and Canada.

Federal Wetland Delineation Manual Training Workshop, September 1990.

This "training the trainers" delineation course for the states was conducted in Zion, Illinois. The program had 30 participants from 23 states. Problems and issues with the Federal Wetland Delineation Manual were also addressed.

State Wetland Workshop: Addressing Critical Issues - Federal/State Coordination and Cooperation, September 1990.

This Washington, D.C. meeting focused on emerging issues in federal/state wetland programs. It identified new directions and innovative approaches in state programs, and made recommendations for improving federal/state coordination and cooperation. There were 30 representatives from various states, although not all states participated.

International Symposium: Ecotourism and the Conservation of Natural Resources, November 1990.

This meeting was held in Miami Beach, Florida, and attended by over 400 individuals from 30 countries. The meeting focused upon opportunities for reconciling resource protection with economic development.

National Workshop on State Wetland Regulations: Wetlands and Water Quality, Clean Water Act Reauthorization, and State Wetland Delineation Manual, May 1991.

This three day in-vitational workshop held in Wilmington, Delaware was attended by 130 individuals from 25 states.

National Symposium and Annual Meeting: Regulation of Altered, Artificial, and Managed Wetlands, September 1991.

This meeting held in Chicago, Illinois, focused on the difficult technical and policy issues in regulating altered, artificial, and managed wetlands with special emphasis on agricultural wetlands. About 300 people attended.

Strengthening State/Federal Wetland Protection and Restoration in Water-Scarce Regions, March 1992.

The goal of this meeting attended by 30 people held in Houston, Texas, was to identify approaches for the states to strengthen wetland and riparian habitat protection and restoration in cooperation with the federal government, and the private sector.

State Perspectives on Wetland Classification, March 1992.

This technical workshop with 60 participants from 23 states was held in Washington, D.C.

Wetland Delineation: Drafting a State Wetland Delineation Manual or Revising the Proposed Federal Wetland Delineation Manual, March 1992.

This technical workshop with approximately 100 participants from 22 states was held in Washington, D.C. in death with wetland delineation.

National Wetland Symposium: Effective Mitigation: Mitigation Banks and Joint Projects in the Context of Wetland Management Plans, June 1992.

The focus of this meeting held in West Palm Beach, Florida, was on mitigation banks and joint projects in the broader context of wetland management. There were 375 attendees.

Wetlands and Watershed Management, 1992.

A series of five workshops with 600 participants were conducted in the fall of 1992 and spring of 1993 by the Association or by cooperating parties in conjunction with the Association in West Palm Beach, Florida; Eugene, Oregon; Niagara Falls, New York; Atlanta, Georgia; and Reno, Nevada.

Annual Membership Meeting and International Wetland Symposium: Improving Wetland Public Outreach, Training and Education, Interpretation, June 1993.

The goal of this symposium was to improve wetland regulatory, planning, land management and other wetland conservation efforts through improved wetland education, interpretation, training, technical assistance, and other outreach efforts. There were 150 attendees.

PART 1: WHY WETLANDS AND WATERSHED (WATER RESOURCES) MANAGEMENT IS NEEDED

For reasons which will be discussed shortly, advanced planning of wetlands in a watershed context is needed to help resolve many of the severe problems and conflicts in the protection and management of freshwater and estuarine wetlands now facing the federal agencies, states, and local governments.

Such advanced planning is needed to meet private and public landowner and developer needs for more certainty, predictability, flexibility, and lower costs in wetland regulation. (See Table 1.) Such advance planning on a hydrologic unit basis is also needed to improve the rationality and coordination of wetlands and other water management programs, reduce cumulative impacts and degradation, lower the costs, and help balance environmental and economic needs including the rights of private landowners. Such advanced planning is needed to meet the needs of environmental organizations, land trusts, and other groups interested in no net loss of wetlands, net gain of wetlands, and achievement of broader environmental goals (e.g., restoration of water quality, protection of endangered species) by reducing cumulative losses, improving the efficiency of wetland management programs, and providing the basis for successful wetland restoration efforts.

Background: Expansion of Wetland Programs In the Last Decade

Over the last decade, wetland protection, regulation, and management efforts across the nation (the federal Section 404 program, state and local programs) have been expanded from a focus primarily upon coastal and estuarine wetlands and freshwater wetlands adjacent to major lakes and rivers to broader programs that address to isolated wetlands throughout the landscape, and many wetlands along creeks, streams, and smaller lakes and ponds.

There are hundreds of thousands (and perhaps millions) of such isolated wetlands and wetlands adjacent to smaller water bodies throughout the United States, particularly in Alaska, the northern glaciated states (Maine to Washington), states with slow-moving and low gradient rivers with large floodplains (e.g., Mississippi and Louisiana), and states with moderate to high rainfall and large areas of relatively flat topography (e.g., Maryland, South Carolina, and western New York). These wetlands include vernal pools and playas in the West, permafrost wetlands in Alaska, "slope" wetlands in the mountain states, "prairie pothole" and "kettle hole" wetlands in the midwest and throughout the northern states, "sink hole" wetlands in areas of karst topography such as Kentucky, pocosins in the Carolinas, and the narrow ribbons of wetland and riparian habitats along the millions of miles of smaller rivers and streams throughout the United States.

These wetlands include much of the estimated 50 million plus acres of partially drained agricultural wetlands. They include many stormwater detention facilities (which have inadvertently become wetlands) and wetlands created by artificial blockage of natural drainage by roads, railroads, bridges, dikes and levees, and other fill and grading operations.

The total number of these wetlands is enormous and the collective acreage of these wetlands is great but their impact upon land use decision-making is even greater. Because they occur in depressions and poor drainage areas throughout the landscape and along the network of minor rivers and streams in which transecting parcels are used or intended for use for subdivision, road building, agriculture, and other purposes.

Why a Watershed Approach is Particularly Needed for Isolated Wetlands and Wetlands Along Smaller Creeks, Streams, Ponds, and Lakes

Water is, of course, the key to all wetland characteristics including wetland functions and values. "Wetlands" are wetlands only if they are, in fact, "wet" and remain periodically wet over time.

As in shallow water or high groundwater systems, all wetlands are susceptible to changes and fluctuations in water supply and water quality. Wetlands differ from other water bodies such as lakes, streams, and reservoirs in that they are shallow water systems and are quite often dry at least a portion of the time. Because they are shallow water systems, even relatively small fluctuations in ground and surface water levels (less than a foot) greatly affect wetland vegetation and animal species, wetland functions, and even, in some instances, the very existence of the wetland. In contrast, water levels in a lake or stream may fluctuate several feet with little change in the appearance of the lake or stream.

Coastal wetlands, estuarine wetlands (to a lesser extent), and wetlands adjacent to major rivers and lakes are less sensitive changes in the immediate watershed including local allocations of water because the water in the wetland is often derived primarily from the adjacent water body. In the case of tidal wetlands and (to a lesser extent) estuarine wetlands, the source of the water--the tides--and water levels are quite regular although storm surges and long-term changes in sea level do occur. In the case of major rivers and lakes, water supply and water levels are also relatively constant and predictable although they also fluctuate seasonally and are also dependent upon what happens in larger watersheds.

Case-by-case regulatory approaches not utilizing a watershed concept and applied in the Section 404 program and state and local wetland regulatory programs have worked moderately well for coastal wetlands and wetlands along major rivers and streams with relatively constant and ascertainable water supply but they work much less well for isolated wetlands and wetlands along smaller creeks, streams, lakes, and ponds for the following reasons:

1. The water levels in isolated wetlands and wetlands along smaller creeks and streams often fluctuate widely on a seasonal basis and even more dramatically over a period of years in response to long-term precipitation cycles. Wetland vegetation and, in some instances, wetland soils change in response to such fluctuations. Because of these changes in water levels and vegetation the appearance of these wetlands and their use by various wildlife also changes. Short-term functions and values also change. During dry periods, landowners often fail to perceive these areas as wetlands.

2. Isolated wetlands and freshwater wetlands along smaller rivers and lakes are particularly dependent upon what happens in their immediate watersheds. The water in isolated freshwater wetlands, wetlands along rivers and creeks and to a lesser extent, estuarine wetlands, comes from precipitation. This precipitation reaches wetlands through a combination of direct precipitation surface runoff from immediate watershed and groundwater infiltration. There is often little opportunity for offsetting watershed influences as with larger rivers, streams, and lakes.

3. Activities throughout watersheds affect the amount of flow into a wetland, the velocity of the flow, the timing of the flow, and other features determine the short- and long-term characteristics of freshwater wetlands. What happens in a watershed not only determines existing features of an isolated wetland or a wetland along a smaller creek or stream but future characteristics including functions and values. For this reason, wetlands are highly vulnerable to dikes, dams, or levees, water diversions for agriculture or domestic water supply, or groundwater pumping. Wetlands are vulnerable to land-clearing and urbanization, which increases the total amount of runoff and peak runoff. Wetland protection and management becomes integrally interrelated with other watershed-based land and water management programs including water supply, stormwater management, floodplain management, and point and nonpoint pollution control efforts.

Problems With Lack of a Watershed Approach

Wetlands are now typically regulated in federal, state, and local regulatory efforts as separate, distinct entities without regard to their role as part of broader water systems. Obvious and well-established hydrologic features of wetlands are often ignored in efforts to delineate, classify, evaluate, protect, restore, create, or otherwise manage wetlands.

The failure to interrelate and the management of wetlands along smaller lakes, streams, and lakes with watershed management has resulted in a variety of problems:

1. Wetlands are not being protected despite expenditures of large sums of private sector and public sector money. The goals of permitting, restoration, etc. are simply not being achieved in many instances. The reason is that you cannot protect isolated wetlands along smaller rivers and streams by regulating only the wetlands and not the activities affecting water quantity and quality. This is particularly true for regulatory efforts such as the Section 404 program, which regulates only fills.

Fills are the major threats to many coastal and estuarine wetlands and wetlands adjacent to other water bodies. Such wetlands are not easily drained because the source of water is adjacent to a water body. Even if you dig a ditch in the wetland, the water level will continue to be approximately that of the adjacent water body. In contrast, isolated wetlands can be drained. Drainage is not regulated. Beyond this, diversions and groundwater pumping are not regulated.

2. **Cumulative impacts are not being addressed.** Freshwater wetlands are gradually (and sometimes not so gradually) destroyed by groundwater draw-down, diversions, drainage ditches, and other activities that disturb natural water levels.

3. **Landowners are subjected to a variety of confused and uncoordinated regulatory requirements--floodplains, stormwater, water supply, point and nonpoint source, grading, etc.** Overlap in programs and efforts is common.

4. **Outright conflicts occur in water-related programs in some instances--stormwater, water quality, wetland protection.** See discussion below. There are no conflict resolution mechanisms in place. This results in complaints and opposition to all programs.

5. **Evaluation of functions and values is inaccurate and may have already been taken beyond rational extremes without consideration of watershed factors.** It is very difficult to determine the functions of altered, artificial, and managed wetland systems without knowing the short-term and long-term water regime since all functions and values depend upon this regime. Increasingly sophisticated evaluation methodologies are a waste of money if they fail to take into account what has happened and what will happen to the most basic attribute of wetlands--the water.

6. **Money is not being spent effectively.** Instead of focusing on short-term and long-term hydrology, many regulatory permitting efforts and restoration efforts focus on existing vegetation--a poor long-term indicator of functions or values.

7. **The relationship between wetlands and other waters is not properly considered despite the dependence of most wetland functions and values upon these interrelationships.** In addition, the relationship between wetlands and uplands is not considered.

8. **Mechanisms are not available to resolve on-site/off-site disputes for mitigation, in-kind and out-of-kind.** Areas with the highest restoration potential are not being identified.

9. **Restoration projects are simply not working despite expenditures of large amounts of money.** Historical water regime is not adequate for wetland restoration unless the water regime is restored. Restoration is dependent upon continued water supply, adequate water quality, low velocities, low sediment, and continued pulsing or active management.

Where a Wetlands/Watershed Management Approach is Particularly Critical

A wetland/watershed approach is particularly critical when water regimes have already been changed or are changing due to urbanization, clearing, groundwater pumping, water diversions and water supply, and other activities including:

- ◆ (a) Urban areas and other areas of intensive land development;
- ◆ (b) Agricultural areas;
- ◆ (c) Areas where restoration is proposed including cooperative projects and mitigation banks; and
- ◆ (d) Areas where water is scarce (e.g., much of the West) and much of the existing water is appropriated for various activities.

TABLE 1**Goals of Wetland/Water Resources Management Plans**

- ◆ Improve water/wetland resource protection and restoration, and
- ◆ Provide greater certainty, predictability, flexibility and lower costs for landowners.

TABLE 2**Landowner Benefits of Wetlands and Watershed Management Plans**

Overall benefit: more predictable, more certain, more rational, less duplicative, more integrated, and more flexible wetland/water resources regulations.

More specific benefits include:

- ◆ 1. Helping landowners simultaneously address floodplain, stormwater, water supply, point and nonpoint pollution control, sediment control, wetland protection, and other planning and regulatory requirements.
- ◆ 2. Helping landowners predict natural hazards and off-site impacts and determine whether wetland alteration all cause nuisances and potential law suits.
- ◆ 3. Helping landowners and their consultants delineate wetland boundaries, particularly with regard to altered systems.
- ◆ 4. Helping landowners determine appropriate wetland/water management needs.
- ◆ 5. Facilitate use of regional mitigation banks and cooperative ventures.

TABLE 3**Resource Conservation Benefits of Wetland Management Plans**

Overall benefit: Better protection and restoration of wetlands/waters by predicting and protecting wetland water supply and water quality and integrating wetland protection/restoration into broader water management efforts.

More specific benefits include:

- ◆ 1. Better addressing cumulative impacts.
- ◆ 2. Providing a more rational basis for delineating, evaluating, and managing wetlands consistent with wetland characteristics.
- ◆ 3. Providing a more integrated and cost effective approach to wetlands, stormwater, floodplain management, water supply, etc.
- ◆ 4. Bringing key actors into the wetland management process.
- ◆ 5. Identifying prime restoration needs and areas; help resolve disputes over on-site/off-site and in-kind/out-of-kind mitigation.
- ◆ 6. Improving the success of restoration efforts.
- ◆ 7. Identifying opportunities for regional restoration efforts including mitigation banks and cooperative mitigation ventures.

**TESTIMONY OF LANGDON MARSH, EXECUTIVE DEPUTY COMMISSIONER,
NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION**

Good morning and thank you for the opportunity to share my views on wetlands conservation. I am Langdon Marsh, Executive Deputy Commissioner of the New York State Department, of Environmental Conservation, the agency with primary responsibility for wetlands management in New York. I also had the privilege of working with the National Governors' Association and was Chairman of the NGA staff working group that developed the wetlands policy endorsed by the governors in February 1992. I am testifying today on behalf of NGA and the State of New York.

I would like to start by saying how pleased we are by S. 1304. I commend Senators Baucus and Chafee for drafting and introducing this bill. It is viewed by many as an honest, fresh attempt to address the real issues facing wetlands conservation and regulation. This bill confronts and addresses the problems related to protecting our wetlands heritage. We are proud at NGA and in New York State to have helped develop recommendations that are reflected in this bill.

We are also pleased that the policy recently released by the White House is consistent with the direction of this bill. With the administration and congress so closely aligned, we are optimistic that progress on wetlands protection can be made.

As you know, the governors have recommended that any wetlands strategy incorporate five general principles: first, protection efforts should be coordinated to make the best use of scarce resources and minimize inconsistencies among Federal, State, and local programs. Second, Wetlands Management should be integrated with other resource management programs such as Flood Control and Nonpoint Source Pollution Control. Third, wetlands delineation criteria and policies should recognize the significant regional variance in the resource. Fourth, land use regulation is traditionally a state and local function and a wetlands regulatory program should be designed to facilitate state assumption. And finally, the governors believe there should be recognition of the unique situation encountered by the state of Alaska Wetlands Constitute as much as 75 percent of the landscape. Government agencies and stakeholder groups should work cooperatively to develop regional wetlands strategies that for that state. Accommodate sustainable wetlands protection and economic growth.

As States, we are reassured that congress recognizes that State and local governments can be partners and viable players in wetlands protection. Because they often have regional offices that are close to the wetlands resources, States are better positioned than the Federal Government to provide program services. In addition, they can often respond to the regulated community in a more timely and predictable manner.

Of course, the abilities and interests of the 50 states and thousands of localities vary considerably, but states and local governments should be encouraged to participate to the degree they can.

We are aware that some parties in the debate are wary of stronger state and local involvement, fearing that a loss of wetlands protection will result. This will not be the case. We welcome a strong Federal framework and close cooperation to ensure a strong program, but it is likely that the states and localities that choose to become involved will do so to strengthen protection or to improve delivery of the program. Consistent federal oversight will ensure that wetlands do not fall victim to local politics in the future.

We also welcome provisions of S. 1304 that endorse programmatic general permits; support and fund state comprehensive wetlands conservation plans and regional watershed-based plans; and ensure state representation on the interagency coordinating team. I note that the bill is silent on program assumption, however. Whereas most of the problems with assumption are regulatory and not statutory, we strongly recommend authorizing full or partial program assumption. States should be permitted to assume discrete and clearly identifiable portions of the section 404 program as they develop the capability to do so rather than requiring the entire program to be delegated at one time. There may be situations where wetlands program jurisdiction is shared within a state, as in New York where authority is shared between my Department of Environmental Conservation and the Adirondack Park Agency. Other states may choose to focus on a particularly sensitive or important subset of its statewide resource. These efforts should be fostered, not constrained.

Although many people do not think of New York as an agricultural area, farming is still the number one industry in our predominantly rural state. We are pleased to note the many provisions of S. 1304 that will decrease the conflict that has historically occurred between wetlands protection and agriculture. Provisions to increase

coordination with the Secretary of Agriculture, for example, should prevent problems from occurring by considering the impact of new policies on agriculture early on. We support exempting from the definition of wetlands prior converted croplands and certain artificial wetlands created incidental to agriculture. We also support continuing the exemption for ongoing agriculture practices.

Because it is important to view farmers as partners in wetlands protection, these provisions are particularly important. In addition, we are pleased that congress has chosen to expand the Wetlands Reserve Program, supported by us and the White House policy, to create a National cooperative wetlands restoration strategy. We recommend, however, that the restoration strategy complement and not replace the wetlands reserve program.

Perhaps the types of provisions that will be most welcome by the majority of the affected public will be those that provide for regulatory reform. NGA, and we in New York, have supported efforts to make the regulatory process fair, reasonable, and predictable, believing that the vast majority of the people prefer to comply with wetlands protection efforts if they can understand what is required and expected of them. We have recommended some of these changes in the past and are pleased they appear in the bill. They include creating reasonable timelines for permit review; establishing an administrative appeals process; and supporting mitigation banks. Other changes proposed in the bill that we believe are creative and welcome additions include providing training and assistance to small landowners on delineation; creating an available index of all regulatory documents; and requiring the agencies to assess their needs so that an efficient program can be designed.

Beyond efforts to improve delivery of a strong regulatory program, S. 1304 also strengthens wetlands protection. It endorses the no net loss goal; clarifies the definition of wetlands; expands the list of activities subject to jurisdiction under section 404; and more clearly defines what is "fill." We do believe that watershed-based planning for wetlands also will greatly enhance wetlands protection in the long term. My fellow colleague from Oregon will be speaking in more detail about watershed and local wetlands planning, but I want to express my strong support for these provisions in the bill. I understand that local and regional wetlands planning has been characterized by some as an effort to weaken rather than strengthen wetlands protection. I cannot disagree more. Absent a context for wetlands decision making, we will continue to see cumulative losses and will not have the proper perspective for functional assessments and mitigation.

In spite of our enthusiasm for S. 1304, we are disappointed that the bill does not contain explicit language governing sequencing of mitigation requirements. We believe it is critically important first to always avoid impacts to wetlands, then to minimize any impacts that cannot be avoided, and finally to offset any remaining impacts through compensatory mitigation such as restoration or creation of wetlands. Without an explicit declaration in the statute of these sequencing requirements, we fear that too often the process will jump to compensatory mitigation when, in fact, the impact may have been avoidable altogether. We do believe some flexibility must be available—which is best defined through watershed or regional plans—but we strongly urge that sequencing be followed whenever possible.

In closing, I would like to reiterate that we are encouraged by the similarities between S. 1304 and the White House Wetlands policy. Some provisions are explicitly similar, such as using the current EPA definition of wetlands; endorsing state wetlands conservation planning; and exempting prior converted croplands. Others are conceptually similar: providing timelines for permit reviews; increased outreach to educate the affected public; and continued use of the 1987 manual. I urge congress and the administration to continue this cooperative approach and to aggressively seek to move wetlands protection forward and out of the morass of conflict that has consumed it for the past several years. On behalf of New York and other states, we welcome the new spirit of cooperation and partnership with the states, and look forward to helping deliver a stronger wetlands program.

Thank you. I welcome any questions you may have.

Testimony provided by Mark Latch, Director, Division of Water Management, Florida Department of Environmental Protection to the Senate Committee on Environment and Public Works, Subcommittee on Clean Water, Fisheries and Wildlife -- 9/15/93

Good morning/afternoon, my name is Mark Latch and I am the Director of the Division of Water Management in Florida's Department of Environmental Protection. The Department is the lead state agency for permitting of activities impacting waters and wetlands. We are also seriously considering state assumption of the Clean Water Act Section 404 permit program. For these two reasons, we have a vital interest in reauthorization of the Clean Water Act, specifically as it relates to Section 404.

Florida has an extremely active wetlands permit program based on regulation of wetlands impacts through the dredge and fill program and regulation of the management and storage of surface water. Authority for these two programs is split between the Department and five regional Water Management Districts. Recent interagency agreements and legislation have resulted in the first steps toward streamlining these regulatory programs into a single decision making process and developing a statewide wetlands delineation methodology. The intent is that when the streamlining process is completed an applicant will deal with a single agency for all wetland permits required under state law. To further this streamlining initiative, the state requested and received funding from EPA to investigate the feasibility of assuming the Section 404 permit program and, potentially, develop an assumption package.

However, based on the work conducted to date, we find that a State Programmatic General Permit may be a more attractive alternative for the Florida program. Given the current statutory restrictions on assumption, that are contained in the Clean Water Act, it is not possible to develop an assumption package for a comprehensive statewide program such as Florida's. We have proposed the following language to the Florida delegation to amend the Clean Water Act. We think this language will remove some of the impediments to assumption.

1. This amendment removes the prohibition on states assuming the federal dredge and fill program for navigable waters. Without this amendment, the state would not be able to assume the federal program in large portions of the state. In addition, because the boundaries between navigable and non-navigable waters are not clearly defined in many waters, assumption would add a step to determine which agency had jurisdiction. Both of these factors would severely impede the goal of establishing a procedurally simplified program. Permits required by Section 10 of the Rivers and Harbors Act will still be required for construction in navigable waters, but could be reviewed under a State Program General Permit or nationwide Permit that is based on proper review of navigational issues in the 404 permit.

Section 404(g)(1) is amended by striking language as

follows:

(g)(1) The Governor of any State desiring to administer its own individual and general permit program for the discharge of dredged or fill material into the navigable waters ~~(other than these waters which are presently used, or are susceptible to use in their natural condition or by reasonable improvement as a means to transport interstate or foreign commerce seaward to their ordinary high water mark, including all waters which are subject to the ebb and flow of the tide seaward to their mean high water mark, or mean higher high water mark on the west coast, including wetlands adjacent thereto)~~, within its jurisdiction may submit to the Administrator a full and complete description of the program it proposes to establish and administer under State law or under an interstate compact. In addition, such State shall submit a statement from the attorney general (or the attorney for those State agencies which have independent legal counsel), or from the chief legal officer in the case of an interstate agency, that the laws of such State or the interstate compact, as the case may be, provide adequate authority to carry out the described program.

2. This section amends the Act to remove the current five year limitation on state-issued 404 permits. There is no similar limitation on the issuance of 404 permits by the Corps of Engineers. Florida law allows issuance of 25 year permits with a five year review. This amendment allows issuance of permits in the same manner as current Florida law. There does not appear to be any need to limit the term of permits to five years as long as periodic review, with the addition of applicable new requirements, is required.

Clause (ii) of Section 404(h)(1)(A) is amended to read as follows:

"(ii) shall be -

"(I) issued for fixed terms not exceeding 25 years; and

"(II) if issued for a term that exceeds 5 years, reviewed by the State not later than 5 years after the date of issuance and every 5 years thereafter for the duration of the term to ensure that the conditions of the permit are being met by the permittee and to consider, and include as permit conditions where appropriate, all applicable rule requirements adopted during the prior 5 year period.

3. The current Act requires that as soon as a state program is approved, all pending applications are transferred to the state. This has been termed the "clean break" provision. However, a clean break will have adverse impacts on the state, the Corps of Engineers and applicants. The immediate transfer of large numbers of

permits that have been processed in part by the Corps of Engineers to new processors could potentially overwhelm the state system. State processors would be taking on a large number of permit applications at various stages of preparation. This will likely result in delays for applicants while the state processors become familiar with applications on which the Corps of Engineers personnel have already spent considerable amount of time. In addition, the sudden transfer of the permits would not allow the Corps of Engineers adequate time to adjust personnel to other tasks and allow for phase out of positions, should that be necessary. This proposed provision will allow the Corps of Engineers to complete the processing on applications that are already before them and the state would be responsible for the new applications that were submitted. This is especially important in states such as Florida in which there are large numbers of applications for permits pending at any one time. However, the same rationale would apply to other states as well.

The other amendment to this section provides for the Corps of Engineers to continue monitoring, enforcing and issuing any modifications of previously issued Corps of Engineers permits. The justifications for this provision are similar to those expressed above for processing permit applications. The Act does not specifically assign the responsibility for continued administration of previously issued permits. Allowing the Corps of Engineers to retain responsibility for such activities would relieve the potentially excessive burden on the state in enforcing unfamiliar permits, provide for a smoother transition for the Corps of Engineers, and afford applicants better continuity by allowing them the ability to deal with the original permitting agency.

Paragraph (4) of Section 404(h) is amended by striking and adding language as follows:

(4) After the Secretary receives notification from the Administrator under paragraph (2) or (3) of this subsection that a State permit program has been approved, the Secretary shall transfer any applications for permits ~~subject before the Secretary for activities with respect to which a permit may be issued pursuant to such State program and received after such notification~~ to such State for appropriate action. The Secretary shall retain the authority to administer and enforce the permits issued by the Secretary, including the authority to issue and enforce modifications thereto.

We also propose changes to the language regarding general permits allows the Corps of Engineers to enforce and administer previously issued permits. The language is similar to that proposed for individual permits. The same rationale as was given for individual permits supports this provision.

Paragraph (5) of Section 404(h) is amended by striking and adding language as follows:

(5) Upon notification from a State with a permit program approved under this subsection that such State intends to administer and enforce the terms and conditions of a general permit issued by the Secretary under subsection (e) of this section with respect to activities in such State to which such general permit applies, the Secretary shall suspend the issuance ~~administration and enforcement of such general permit with respect to such activities but shall retain the authority to administer and enforce the general permits previously issued by the Secretary with respect to such activities.~~

4. This amendment allows the Administrator the ability to overlook minor differences in the proposed state program so long as the effectiveness of the protection of waters of the United States is not impaired. If the program does not differ from the requirements, the Administrator is not required to make an explicit determination as the requirements are designed to ensure parity of programs.

Paragraph (6) is added to section 404(h) to read:

"The Administrator may approve a program submitted under subsection (g)(1) that varies in minor respects from the requirements of this section if the Administrator determines, after review of the proposed state program, that the proposed state program will afford the same or greater degree of protection to waters of the United States as the federal program affords."

5. This amendment provides funds to allow for the start up of the program by a state. The expenses incurred by an assuming state program for training personnel, adopting procedures and providing facilities and equipment to handle the new program will be significant. The states will need assistance to carry out all of the activities required for the transfer of the program and setting up the needed coordination with federal agencies.

Paragraph (6) of Section 404(h) is continued to read:

(A) IN GENERAL. - The Administrator of the Environmental Protection Agency is authorized to make a grant to any State that has received approval for an individual or general permit program for the discharge of dredged or fill material into navigable waters pursuant to section 404 of the Federal Water Pollution Control Act (33 U.S.C. 1344).

(B) USE OF GRANTS. - Amounts of a grant made to a State under subsection (A) may be used by the State only for covering administrative and other expenses associated with commencing the implementation of a permit program described in subsection (A).

(C) AUTHORIZATION OF APPROPRIATIONS. - to carry out

this section, there are authorized to be appropriated to the environmental protection agency \$1,000,000 for fiscal year 1994 to remain available until expended.

These amendments would go a long way toward making assumption of the Section 404 program more attractive to Florida and other states. Given the experience of Florida and other states that have considered assumption, we would also suggest that consideration be given to clarifying the relationship between federal endangered species protection statutes and state assumed Section 404 permit programs. Protection of endangered species is a major emphasis under the existing Florida program. However, should we assume the Section 404 program, we are concerned that current federal statutes and policies may result in an excessive federal agency coordination burden on the state with no increase in endangered species protection.

Thank you for the opportunity to comment on Florida's concerns with respect to the Clean Water Act reauthorization.

We understand that there are currently two bills filed that deal with Section 404 of the Clean Water Act. Department staff has reviewed S. 1304 and we offer the following comments for the record. We received a copy of S. 1195 late last week and were not able to complete our review in time for this hearing. We will submit S. 1195 comments as soon as possible.

The amendments to the Clean Water Act proposed by Senators Baucus and Chafee in S. 1304 codifies many of the components included in President Clinton's recently announced wetlands initiative. In general, the bill includes good measures for the effective and efficient protection and regulation of wetlands and is strongly endorsed by the state of Florida. The specific comments that follow relate to areas of the bill that will have an effect on the state's protection of wetlands, our efforts to reduce the duplication between the state and federal wetland regulatory programs, and other comments based on our experience with wetlands regulatory programs.

SEC. 3 DECLARATION OF POLICIES AND GOALS

The proposed language, (3)(8), does not emphasize the enhancement of degraded wetlands or the need to increase the extent of and prevent the overall net loss of functional wetlands. We suggest the language be revised as follows:

"It is the national policy to achieve, through regulatory and non-regulatory strategies involving all levels of government--

(A) the restoration and enhancement of degraded wetlands to increase the quality and quantity of the functional wetland resources-base of the United States; and

(B) no overall net loss of the remaining functional wetlands resource-base of the United States."

SEC. 4 DEFINITION AND DELINEATION OF WETLANDS

We concur with the position of the bill that the 1987 Federal Manual should be used in the interim period while the National Academy of Sciences studies the issue of wetland delineation. The 1987 manual provides sufficient flexibility so that it can be used to achieve accurate wetland delineations in Florida. However, the 1987 hydrology criteria is much too long (12.5% of the growing season or about 45 days in Florida). We feel that the appropriate hydrology criteria is that which results in the development of hydric soils. Therefore, a more appropriate number for the hydrology criteria would be 7 continuous days of inundation or 14 or more continuous days of saturation. We also strongly concur with the portions of this section that require that the new guidelines issued be developed in consultation with the States, and take into account regional or state variations in hydrology, soils and vegetation. This is critical to developing a wetland delineation methodology that is accurate nationwide. The previous methodologies did not allow for regional variation.

Additional examples of wetland types should be added to reflect the type of wetlands that occur in Florida. It is specifically suggested that the following wetland types be added: hydric seepage slopes, bayheads, cypress domes and strands, sloughs, wet prairies, riverine swamps and marshes, tidal marshes, and mangrove swamps.

The proposed annual \$5,000,000 taxpayer subsidy to private landowners who "lack the financial capacity to identify or delineate wetlands in order to apply for permits...or to avoid impacts to wetlands" has the potential of serious abuse and diverts scarce federal resources from existing wetlands delineation programs. This approach is particularly troubling since the Corps currently does not charge a fee for wetland delineations. Further, the 90 day time clock for wetland delineations, may be an unreachable goal depending on staff resources and workload. We suggest that, at minimum, the time clock only apply to complete requests.

SEC. 5 REGULATION OF ACTIVITIES

This section makes changes to the activities that are regulated, and appears to close some existing loopholes in the federal program. The new definition of "fill material" appears to include pilings (although this is not explicitly stated), which were not previously covered. Previously, projects designed to circumvent the regulations, such as development built on pilings rather than fill, could not be regulated. This change makes the federal program more consistent with Florida's program.

The new definition of "discharge of dredged or fill material" now appears to include excavation in wetlands (although in a somewhat convoluted manner) and closes

another loophole in the existing federal program. This change makes the federal program more consistent with Florida's program.

SEC. 6 PERMIT PROCESSING IMPROVEMENTS

This section requires that the Corps of Engineers must take action on an application within 90 days of the date of publication, with exceptions for some listed circumstances. Florida's program has a similar requirement, but the 90 day time clock begins at the time the application is complete. It has been our experience with the Corps of Engineers program that publication of the application is done long before adequate information has been received to make a decision on the application. Therefore, unless the Corps of Engineers is allowed to obtain this information prior to publication, this provision may not be workable, and may result in the Corps of Engineers having to deny applications to meet the 90 day time clock when adequate information has not been submitted. The existing provisions regarding publishing need to be examined to determine if there is enough flexibility to allow the Corps of Engineers to request this needed information prior to publishing. If not, changes should be made that provide for requesting and receiving the needed information prior to publishing. To overcome the fear that the agency may make unreasonable information demands, a provision, such as exists in Florida's program, could be incorporated that allows the applicant to request that publishing, and hence the 90 day clock, begin with the information already submitted.

This section also provides that the 90 day time clock can be waived if the Secretary and the permit applicant determine that additional time is needed to evaluate the application. This is a useful provision that provides needed flexibility to resolve problems. However, this provision should not be viewed as a solution to the problem discussed in the previous paragraph, as it will inevitably lead to charges that the agency is routinely having to request additional time from the applicant, and that they are not meeting their charge to act within 90 days.

SEC. 7 GENERAL PERMIT IMPROVEMENTS

This section includes specific provisions for general permits to be issued to existing State, Tribal, regional or local regulatory programs to avoid duplication if the programs meet certain conditions. This section appears to address the legal concerns over the validity of State Programmatic General Permits (SPGP) that have occurred under existing law and if so, should greatly enhance the usefulness of this approach to reducing regulatory overlap in Florida. The conditions and requirements included in this section to be placed on a state under a State general

permit appear to be reasonable and appropriate. The State of Florida strongly supports this section of the bill.

The bill contains language that restricts general permits to regional and local entities after December 31, 1996, to areas with an approved wetlands and watershed management plan. We would like to stress that this requirement should not apply to state programmatic general permits, which is our understanding of the bill. Developing a statewide wetlands and watershed management plan pursuant to Section 322 would not be possible on a statewide basis.

On page 11, line 5, the following change would seem to more accurately reflect the intent of this paragraph:

"...Atmospheric Administration) to review permit [decisions] applications..."

SEC. 8 COORDINATION AND CLARIFICATION OF PROGRAM CONCERNING AGRICULTURAL ACTIVITIES

In general, the changes in this section appear to make the federal program more consistent with Florida's program. There are several areas in this section that discuss exempt activities that need clarification. Specifically, it is not clear that some of the activities mentioned are related to agriculture, and therefore exactly which activities are exempt is not clear. It may be preferable to separate out those exempt waters or activities that are not intended to be related to agriculture. Specifically these include:

Page 14, 20-22, which relates to artificial reflecting or swimming pools or bodies of water created for aesthetic purposes in uplands,

Page 15, lines 1-5, which relates to mining pits in uplands,

Page 15, lines 6-8, which relates to treatment areas that are not modifications of navigable waters,

Page 15, lines 17-21, which relates to maintenance of groins, riprap, breakwaters, causeways, bridge abutments or approaches, and "transportation structures",and

In addition, we have concerns that some of the activities proposed to be exempt have the potential to cause significant adverse environmental impacts, and should not be included as exemptions. These include:

Page 15, lines 13-16, minor drainage should be deleted from the list.

Page 15, line 22, the construction of farm stock ponds should be exempt only when these ponds are constructed

in uplands. The construction of such ponds by impounding streams and wetlands should specifically not be an exempt activity.

Page 16, line 7, which relates to temporary roads to move mining equipment.

It has been our experience in Florida that these crossings for large draglines associated with phosphate mining, can represent more than a minor impact to wetland resources. In addition, these "temporary" crossings may need to remain in place for several years. In our opinion these activities are better regulated under an individual or general permit that provides conditions for construction, conditions and a timetable for removal of the road, and conditions for restoration of the wetland.

The exemptions provided in this section are not identical to those within Florida's program, however, they should not create an obstacle to assumption or an SPGP as Florida's program may be more protective in these areas.

SEC. 9 MITIGATION BANKS

This section requires that rules be established for the establishment, use, maintenance and oversight of mitigation banks, and provides other direction for the use of mitigation banking in the regulatory process. This approach is very consistent with the directives of mitigation banking passed by the Florida Legislature as part of the Florida Environmental Reorganization Act of 1993 (HB 1751). Rules for the use of mitigation banks in the state regulatory process are being drafted and should be adopted by Jan. 1, 1994. This section of the bill should make the federal and state programs more consistent.

SEC. 12 WETLAND CONSERVATION, MANAGEMENT AND RESTORATION

This section provides funding opportunities for states wishing to develop State Wetland Conservation Plans. In the past, Florida has not been interested in pursuing the development of a State Wetland Conservation Plan, as it did not seem to provide many benefits to a state with an advanced regulatory program and established acquisition programs for environmentally sensitive lands. However, the State Wetland Conservation Plan, as outlined in the bill, may be useful to Florida to enable it to acquire funding for worthwhile activities that it has not previously been able to fund. These include an inventory of wetland resources in the State, identification of sites with wetland restoration potential, and measures to assist in the development of wetland and watershed management plans.

This section provides further opportunities for states to obtain funding to develop wetland and watershed plans.

The plan may be developed or implemented by the state, a regional district, local government or any other public or nonprofit entity which has adequate powers to carry out the outlined responsibilities. Most of the agencies dealing with environmental protection in Florida have come to the realization that advanced watershed planning is "the way to go" to provide meaningful protection to the state's wetlands, recognizing that the wetlands are dependent upon, and an integral part of the surrounding ecosystem. The regulatory system alone cannot achieve a proper watershed approach. The problem in implementing this approach has been adequate funding to develop these watershed plans. There has been an debate over whether or not mitigation credit should be given for the development of these plans. Although most people recognize that a plan by itself does not offset actual impacts, there seemed to be no other way to get these much needed plans developed. Federal funding for development of some of these plans is an excellent solution to this problem and should be strongly supported.

**Testimony before
The U. S. Senate
Subcommittee on Clean Water, Fisheries and Wildlife
Committee on Environment and Public Works
Concerning S 1304**

**by
Kenneth F. Bierly
Wetlands Program Manager
Oregon Division of State Lands
September 15, 1993**

I am Ken Bierly, Manager of the Wetlands Program for the Oregon Division of State Lands. I am here today to represent one western state's view of the proposed legislation (S 1304) concerning wetlands in the considerations to re-authorize the Clean Water Act. First, I will describe Oregon's situation, and then I will make some observations applicable to the federal program.

INTRODUCTION/THE SETTING

Oregon is the tenth largest state in the union, a fact I didn't fully appreciate until it became my responsibility to compile an inventory of the state's wetlands. Oregon has a tremendous diversity of climatic and ecological conditions; the northwest coast receives precipitation in excess of 10 feet per year while the interior basins of the southeast get less than 5 inches per year. While temperatures are generally mild, the alpine regions of the Cascade Range and Blue Mountains may freeze any month of the year; snow accumulations in the Cascade Range frequently exceed 20 feet.

Major river systems dominate the landscape of the Pacific Northwest. The mighty Columbia forms our northern border. Flowing north into the Columbia, the Deschutes and John Day Rivers drain the high lava plains of Central Oregon and the Blue Mountains respectively. The Willamette River and many other smaller streams flow through a broad fertile valley draining the flanks of the Cascades and Coast Range. Similarly, numerous streams drain the western flanks of the Coast Range, flowing into the ocean through estuarine marshes. The Rogue and the Umpqua rivers have cut through the Coast Range, to drain the Southern Cascades and the Klamath Mountains. These streams support salmon, steelhead, and native trout runs matched in few areas for quality, quantity and diversity of fishing. On the Cascade, Blue, Coast, and Klamath Mountains are forests that have supported a major timber industry for the last 150 years.

Although more diversified industry is coming to Oregon, the state has traditionally had a resource-based economy. Agriculture is Oregon's leading economic sector. The state produces a broad variety of crops and other agricultural products. True to the pioneering spirit, Oregon's agricultural economy is based primarily on the family farm. Ranking second to agriculture in economic importance to the state is the timber industry. I need not explain the difficulties the state is going through with conflicts between this economic sector and the protection of the spotted owl and ancient forests.

More than half the surface of the state is managed by the federal government--namely the Bureau of Land Management and the Forest Service. Consequently, Oregonians are very sensitive to federal land management issues. Developing a partnership relationship is critical to effectively managing the state's natural resources.

Since 1980, Oregon's population has grown over 13% from 2.6 million to 3.0 million, far outpacing the increase in the United States over the last decade. The population of Portland alone has increased by 25% over the same period. These trends are expected to continue as more people find the Pacific Northwest a desirable place to live. As Oregon's population continues to grow, so also does the demand for resource use.

According to the most recent estimates, there are some 1.4 million acres of wetlands in Oregon. There has been a loss of nearly 38% of the area of wetlands since the settlement of the state. It is important to recognize that much of this historical loss was a direct result of public policy. The Swamp Lands Act of 1860 allowed settlers to obtain property by draining and converting land to other uses. More than 310,000 acres have been transferred to private ownership under this program. During 1905, companion federal and state legislation formulated a program to drain and convert wetlands in the Klamath Basin to agricultural use. Nearly 300,000 acres of wetlands were drained and thus lost in this basin alone.

Federally funded flood control projects have resulted in dikes that alter regular tidal inundation of the upper reaches of many of Oregon's estuarine wetlands. Flood control and drainage projects throughout the Willamette Valley and along the Columbia River have significantly affected seasonal flooding patterns. The expanse of wet prairie in the Willamette Valley has been so reduced that a number of state and federally listed threatened and endangered plant species are associated with those few remaining habitats.

Despite our unique and diverse heritage, Oregon is like most other states. We have a history of wetland losses due to past state and federal policy. There are competing land uses for our remaining wetland resources. Wetland losses have not been equally distributed throughout the state, but concentrated in the urban and agricultural areas of the Willamette Valley, and in other agricultural centers.

OREGON'S WETLAND PROGRAM

The state legislature recognized the importance of aquatic resources to the people of Oregon relatively early. In 1967, out of concern for protection of spawning areas for our native fishery resources, Oregon initiated state laws to regulate the removal of material from state waters. In 1971, out of concern over the filling of estuarine wetlands in Oregon, the legislature (under the leadership of Governor Tom McCall) adopted laws regulating the placement of fill into Oregon's waters. Oregon's legislation preceded the Clean Water Act requirements established in 1972 and Oregon's program has "grown up" with the 404 program.

This parallel history has given Oregon 20 years of experience in working with the federal wetlands program. Oregon's Legislature has changed the state regulatory program nearly every biennial session. In 1989, the Legislative Assembly created a wetlands program that provides a significantly broader context for wetland permitting.

Oregon's existing program:

1. requires the state to develop a statewide wetland inventory;
2. requires the state to provide the completed wetland inventory to each local government (city and county);
3. requires each local government to notify the state of any proposed land use action affecting inventoried wetlands;
4. allows local governments to develop wetland conservation plans under state guidelines and standards;

5. requires the Division of State Lands to issue permits according to the criteria of those state-approved, locally-adopted wetland conservation plans; and,
6. requires the state to develop a public information program about wetlands.

It has been our experience that moving from a regulatory program alone to a more comprehensive wetland management program with a regulatory element is beginning to significantly enhance public understanding and acceptance of wetland regulation.

THE FEDERAL WETLAND PROGRAM

Currently, the federal government's wetland program is predominantly found in Section 404 of the Clean Water Act. The Food Security Act of 1985 (as amended in the 1990 Farm Bill) now also provides wetland regulation on agricultural lands. These two regulatory programs have led to a variety of complaints by environmental interests, development interests and the regulated public. The complaints range from concerns that the program is too expansive and intrusive on private property rights to the claim that the program does not effectively address those activities that lead to significant wetland losses.

I would like to discuss several aspects of the 404 program, as they are addressed in S 1304. The discussion is based on the experience in Oregon where the state has taken a parallel course to the federal 404 program. There are three topics that I believe are of great significance to the people affected by this legislation:

1. THE PROGRAM NEEDS GOALS AND A CONTEXT FOR THE PERMIT PROGRAM
2. THE PROGRAM MUST BE AS CLEAR AS POSSIBLE TO AFFECTED LANDOWNERS
3. THE PROGRAM IS TOO IMPORTANT TO BE ONLY A FEDERAL PROGRAM

PROGRAM GOALS AND CONTEXT

The 404 program is the only Clean Water Act permitting program that does not have a clearly defined goal. President Bush's Domestic Policy Council deliberated for more than four years on the "no net loss" goal. It is time to quit debating and adopt a policy. Without a policy goal, the permitting process resembles "let's make a deal."

S 1304 provides two specific changes to the 404 program that clarifies the program goals and allows a context for permitting to be developed by local Wetland and Watershed Plans. The explicit policy statement "it is the national policy to achieve, through regulatory and non regulatory strategies involving all levels of government-" "(A) the restoration of wetlands to increase the quality and quantity of the wetlands resource base of the United States; and (B) no overall net loss of the remaining wetlands resource base of the United States" provides clear and explicit guidance for policy implementation. This policy statement is bolstered by placing a definition of wetlands in the Clean Water Act. The policy statement and goal have broad support and are clearly needed to eliminate the confusion over the applicability of the Clean Water Act to wetland resources.

Oregon's experience in aquatic resource regulation was established to protect anadromous fish and estuarine marshes. A review of these two resources is instructive as it relates to the Clean Water Act program. Oregon's initial approach was a regulatory permitting program that responded to proposed alterations. In 1973 Oregon adopted a statewide land use planning program. One of the primary elements of that program was the development of estuary management plans adopted by local governments. The plans have identified 99.4% of Oregon's tidal marsh wetlands as Natural (91.8%) or Conservation (7.6%) management units. These locally adopted plans confine state permitting to be compatible with the local land use designations. The result of the planning efforts along the Oregon coast has been a decline (to nearly nothing) of permit applications for tidal marshland filling. The power of the program has been the local process with strong state guidance. The outcome has shaped local expectations and helped identify and truly protect these wetland resources.

Protection of streams for anadromous fish was approached as a regulatory effort without a planned outcome. With current listings of Columbia River salmon stocks as threatened or endangered and petitions to list as many as 100 additional stocks, it has become clear that the reactive permitting program alone is not working effectively. This last state legislative session Governor Barbara Roberts introduced a "Watershed Health Benchmark Proposal" to look at dysfunctional watersheds, evaluate their ills, plan for their improvement, and protect and restore their health. This proposal was funded during a time of budget shortfalls and was seen as the most effective way to approach complex and intertwined natural resource problems.

The Wetlands and Watershed Management Plans (Section 322) are a powerful tool that will allow local communities to devise programs that will work in their circumstances. This portion of the proposed Act is of central importance for two reasons; first it empowers local communities to identify solutions to their unique problems, second it provides specific guidelines for the necessary information and goals for the planning. The adoption of these plans will provide a context for permitting that is currently absent. This structure reestablishes the rational relationship of a permit being an implementation device for a planning effort. The Wetlands and Watershed Management Plans provision of S 1304 is new and necessary for the program to make sense both for the resource and for the affected people.

CLARIFICATION OF THE PROGRAM TO AGRICULTURE

Oregon is an agricultural state. The state's agricultural and fishery production approaches \$3 billion annually. Farm income has been an increasing portion of the state's economy over the last 10 years. Many Oregon commodities rank very high in the national scope, with 26 commodities ranking fifth or better nationally in production or value of production. Maintenance of a healthy agricultural economy is of great significance to the west and especially to Oregon. No other sector of the country understands the importance of water for their economic livelihood than agriculture. We in the west have a clear and pressing need for clean water.

The agricultural community has been encouraged in the past by public policy to drain wetlands for the public good. Many are confused about the reversal of public policy and concerned about the effect of policies and rumors of policies that could affect their operations. In Oregon this becomes very personal, because of the wide variety of crops produced, there are an exceptional percentage of family farms that depend on agricultural income for their livelihood. Additionally, only a small percentage of Oregon farmers are participants in U. S. Department of Agriculture programs.

There is an interesting discrepancy between image and reality in the wetlands program. Public information materials about wetlands focus on standing water and waterfowl. Most public debate surrounds more subtle environments with seasonal flooding or saturation and values other than waterfowl. I have had a poster that the state developed jointly with the Corps and EPA thrust in my face with the challenge, "Why don't you use photographs of my backyard or pasture?" This conflict in perceptions harkens to the discussions associated with the delineation manual but raises the larger question of providing clear information about the recognition of the functions and values of seasonally flooded or saturated systems. Public information and outreach are crucial functions of government that are addressed in S 1304.

The requirement of S 1304 to recognize "Minimal Effects" determinations made by the Soil Conservation Service in consultation with the U. S. Fish and Wildlife Service (Section 7) is a step in regulatory clarification that can only be applauded. The mandate of Section 8 to "develop consistent criteria and procedures" between the Clean Water Act and the Food Security Act is an overdue effort. You have clearly recognized the agricultural communities' concern about the effect of wetland regulatory program on their operations. These steps along with the specific mandate to coordinate activities with the Secretary of Agriculture (Section 8) and the requirement to assist small landowners and provide public information (Section 4) will help to relieve some of the concerns raised by uncertainty.

The approach taken by S 1304 is to clarify the interaction between two complex programs rather than eliminate one or the other. It is an approach that recognizes the problems and addresses them directly. The clarifications provide continued wetland protection and address recognized problems with the program. While some in the agricultural community wish the Clean Water Act would disappear, many of the producers I speak with clearly see the need for the program "if they could just understand it". The recent brochure developed by the Environmental Protection Agency is a big step in the right direction that can be a part of the information required by Section 4 of S 1304.

SHARING THE RESPONSIBILITY

Different levels of government often have differing capabilities and authorities. Clear recognition must be made of the opportunity to achieve the Clean Water Act objectives of protecting the biological and physical integrity of the nation's waters using the authority and creativity of the states and local communities. It is well understood that many of the nation's water quality "problems" result from land use practices. Land use regulation is a police power reserved to the states. Given a federally defined goal, technical assistance, and modest financing, states and local governments can implement equally efficient and more effective programs. State and local programs can direct land use and regulate water use, powers not vested in the federal government.

The Clean Water Act currently recognizes only two mechanisms for states to interact with the federal wetland program; (1) through water quality certification of federal permits, or, (2) by assuming federal permitting. Michigan is the only state to assume the program since 1977. This is an interesting contrast to the other EPA administered programs (402, RCRA, etc.), where most states have assumed authority. In the nine years since Michigan assumed the program, only two projects have raised significant conflict. In both cases the conflicts have been resolved short of legal resolution. Recently EPA conducted an analysis of barriers to state assumption of 404 permitting.

Oregon created a program to encourage local governments to develop detailed wetland conservation plans that require prevention of net loss of wetlands. The level of interest in local wetland planning surprised many people. We have been working with the Portland District Corps of Engineers to identify opportunities to recognize the results of these planning efforts in the federal permitting program.

The legal structure of Section 404 of the Clean Water Act focuses on federal permitting. This focus has limited options available to the federal government, and this has dampened the enthusiasm of local communities to commit to the effort necessary to develop wetland plans. The most clearly expressed concern from local communities is "What good is our investment in time and effort if the Corps is not going to recognize the results?"

The provisions of S 1304 ensure that the 404 program explicitly recognizes Oregon's wetland planning efforts and authorizes regional permitting for acceptable plans that meet the no net goal. Our experience indicates that wetland planning, among other benefits, allows for creation of corridors and connections between fragmented resources rather than encouraging increased fragmentation as the current permit system does.

We also know through experience that involving local communities and state agencies expands the effective labor pool available to protect wetland resources. Since there is little likelihood that significant additional funding will be added to federal programs, effective use of state and local governments to assist in program implementation as structured in S 1304 is crucial to ensure the nation's wetlands are protected. S 1304 specifically creates opportunities for local communities to integrate wetlands into stormwater management, water quality protection, flood protection and other infrastructure needs.

President Clinton has explicitly adopted as a principle for federal wetlands policy that "the Federal government should expand partnerships with State, Tribal, and local governments, the private sector and individual citizens and approach wetlands protection and restoration in an ecosystem/watershed context." This approach has been adopted by Oregon and is supported by Sections 7 and 322 of S 1304. This recognition of the need for partnerships is meek and should be bolstered. Our experience in Oregon is not promising that the federal government is prepared to shift from a "command and control" permitting approach to a "partnership" program that uses planning approaches to define desired outcomes without clear direction from Congress.

The proposed language of S 1304 goes a long way towards creating a national wetlands management program that respects agricultural practices, creates opportunities for local communities to become involved positively and clearly addresses many of the issues of the current program. I encourage your support.

I would ask only one change that I believe would eliminate a confusion in the printed bill. Section 7 (e) (3) (B) which provides a sunset for state program general permits raises significant questions for states (and local governments) that have regulatory programs that duplicate 404. States like Maryland, Florida, Wisconsin, North Carolina, and New Hampshire, etc. have effectively used state program general permits to minimize regulatory duplication and have occasionally increased wetland protection. To make this regulatory clarification become a forcing function on the state to create a wetlands and watershed management plan statewide or regionally after 1996 becomes rather draconian. I would suggest you delete Section 7 (e) (3) (B). The tie between state program general permits and wetland and watershed management plans confuses two issues, eliminating permitting duplication (State Program General Permit) and creating a context for permitting (Wetlands and Watershed Management Plans).

TESTIMONY OF ROBERT G. SZABO, THE NATIONAL WETLANDS COALITION

Mr. Chairman, and Members of the Subcommittee, thank you for the opportunity to appear before you today. My name is Robert G. Szabo. I am a member of the Washington, D.C. law firm Van Ness, Feldman and Curtis and appear before you today in my capacity as Counsel to The National Wetlands Coalition. The Chairman of the Coalition, Mr. H. Leighton Steward, who is the Chairman, Chief Executive Officer and President of The Louisiana and Exploration Company, had previous commitments that did not permit his appearance before you today.

The members of our Coalition thank you for focusing the attention of the Subcommittee on this important, but difficult and divisive, issue as part of the Subcommittee's work on the Clean Water Act Reauthorization legislation. We also thank the Chairman and Ranking Minority Member of the full Committee for their leadership in introducing legislation on this important subject.

Our Coalition has endorsed and continues to support the enactment of H.R. 1304, the Comprehensive Wetlands Conservation and Management Act of 1993, which has not been introduced in the Senate. Our testimony before you today will focus on S. 1304, the Wetlands Conservation and Regulatory Improvements Act, which was introduced on July 28th by Senators Baucus and Chafee, and the President's wetlands program recommendations issued on August 24th, entitled "Protecting America's Wetlands: A Fair, Flexible, and Effective Approach."

THE NATIONAL WETLANDS COALITION:

The National Wetlands Coalition was incorporated on September 1, 1989 for the sole purpose of participating constructively in the Federal wetlands regulatory policy debate initiated by the commitment of President Bush to a national goal of "no overall net loss of wetlands" and his establishment of a Task Force of the Domestic Policy Council to develop the necessary policy recommendations to achieve that goal. Our members are a cross-section of the "regulated community" affected by the Federal wetlands regulatory program. A complete list of our members is attached.

The Coalition recognizes the importance and unique contributions of our nation's wetlands resources and agrees that these resources must be both conserved and enhanced. At the same time, we believe that the nation's policy on wetlands protection must reflect other important national goals with respect to the economic health of the nation, infrastructure services and the rights of private landowners.

The Goal of "No Overall Net Loss of Wetlands":

The Coalition supports the immediate national goal of "no overall net loss of wetlands" and the long-term national goal of increasing the quality and quantity of our nation's wetlands resources. We believe that these goals are achievable so long as they are expressed in terms of the functions and values of wetlands and not acreage. We believe that these goals can be achieved through a comprehensive program that includes a Federal regulatory program that is balanced and realistic and earns the support and cooperation of the private sector. A copy of the Statement of Principles that has guided the advocacy of the Coalition since July, 1990 is attached.

THE CURRENT FEDERAL WETLANDS REGULATORY PROGRAM:

The current Federal wetlands regulatory program is founded on section 404 of the Federal Water Pollution Control Act, which was enacted in 1972 (P.L. 92-500). The current program suffers from several fundamental problems.

First, section 404 was never designed to be a comprehensive Federal wetlands regulatory program as is evidenced by at least two facts. section 404 only requires that permits be obtained from the Secretary of the Army for the "discharge of dredged and full material" rather than for the broader set of activities that can adversely affect the nation's wetlands, such as excavation and drainage. Section 404, moreover, does not contain a definition of the term "wetlands" nor does it, in its major operative provisions, even mention "wetlands." Rather than having been authorized specifically by Congress, with attendant policy guidance, the current Federal wetlands regulatory program has been developed primarily through judicial decisions and agency initiatives.

Second, the current Federal wetlands regulatory program is perhaps one of the most extensive Federal regulatory programs that applies primarily to privately owned land. According to estimates of the United States Fish and Wildlife Service, approximately 75% of the nation's remaining one hundred million acres of wetlands in the lower forty-eight states exist on privately owned property. At the recent White House briefing on the President's wetlands policy recommendations, one of

the briefers representing the Department of Agriculture made the statement that 83 million of the remaining 100 to 115 million acres of wetlands in our nation are located on farms. This is in addition to the 53 million acres that are excluded from the program as "prior converted cropland."

Third, too many Federal agencies have roles in the current Federal wetlands regulatory program, including a shared leadership of the program by the United States Army Corps of Engineers and the Environmental Protection Agency. More often than not, these agencies have been at odds with each other over jurisdiction and the application of the program. Congress created this problem and only a act of Congress can completely resolve the problem and avoid future disagreements.

Finally, probably because the details of the current Federal regulatory program have been developed primarily through judicial rulings and agency initiatives in response to those rulings, rather than pursuant to policy guidance from Congress, we believe that the current program is far too cumbersome and inflexible.

Based on these views of the problems with the current regulatory system, we have advocated that Congress debate this issue fully and "re-legislate" a Federal wetlands regulatory program that works for the environment as well as for local communities, the national and local economies and private landowners. While we continue to believe that H.R. 1330 is the best legislative approach to placing the Federal wetlands regulatory program on firm footing, we believe that S. 1304, the Baucus/Chafee bill, moves in the right direction and that the President's proposals move the program even further in the right direction. We encourage the Congress, however, to codify the principles and directions for the Federal wetlands regulatory program, even if Congress agrees with some of the regulatory initiatives of the President's proposed plan.

COMMENTS ON S. 1304 AND THE PRESIDENT'S PROGRAM:

The Coalition would like to comment on several of the key elements of the Federal wetlands regulatory program, including the manner in which these elements are treated by both S. 1304 and the President's plan. Attached are two side-by-side comparisons developed by the Coalition: one comparing key elements of all major proposed wetlands plans; and one comparing key elements of the President's plan and S. 1304. The Coalition suggests that, as Congress decides the direction and guidance for this program, the Congress must weigh and balance the importance of this environmental goal with other important national goals, such as a sustained economic growth, that are also essential to a healthy and vibrant nation.

JURISDICTION OF THE PROGRAM:

DEFINITION OF A WETLAND:

The first element that establishes the jurisdiction of the Federal regulatory program is the definition of a wetland. Of course, the current law does not contain a definition of "Wetland" nor does it provide guidance to the agencies regarding what lands should be covered by the term "Wetland."

In the last six years, three documents have attempted to describe the jurisdictional limits of the program geographically. In 1987, the Corps of Engineers issued guidelines on this matter, which have not been adopted pursuant to a formal rulemaking. In 1989, four agencies issued a manual for delineating wetlands, which also was not adopted pursuant to a rulemaking and which was rejected as being too broad. In 1991, the Bush Administration attempted to revise this delineation manual, but the 1991 manual was rejected as being too narrow. Congress thereafter directed that the Corps of Engineers use the 1987 guidelines until a manual could be adopted pursuant to a rulemaking and it later commissioned the National Academy of Sciences (NAS) to prepare a report on wetlands delineation. Currently, both the EPA and the Corps of Engineers use the 1987 manual. The President's plan would continue the use of the 1987 manual, as currently interpreted, unless the Federal agencies decide that the results of the NAS study justify a rulemaking to modify the guidelines. The Baucus/Chafee bill would continue the use of the 1987 manual as well, but directs that a new manual will be issued after the NAS study is completed.

The Coalition agrees with the general proposition that the judgments made with respect to the wetlands program must be based on the best available science. However, the judgment regarding the extent of the jurisdiction of the program (including the definition of a wetland) is a question of both science and policy. The Congress may very well determine, for overriding policy reasons, that a certain type of wetland that may qualify scientifically as a wetland should not be subject to the Federal wetlands regulatory program.

The Coalition commends that the 1987 guidelines, as currently interpreted, continue to be used to "define" wetlands except that the definition of wetlands adopted by Congress in the 1990 Farm Bill should govern where there are differences between the 1987 manual and that definition. Because the definition of wetlands, as described in the manual adopted for that purpose, is so fundamental to the program and so important to private Landowners, we believe that any changes that might be justified based on the National Academy of Sciences report should be legislated by Congress. What areas are to be regulated is a question that has plagued the program now for many years, and we don't believe that it should be left to agency discretion to decide the breadth of its own jurisdiction. The Coalition agrees with the provisions of the Baucus/Chafee bill that expand section 404 to reference wetlands and to include a definition of wetlands.

The Coalition agrees with both the Baucus/Chafee bill and the President's plan that "prior converted croplands" should be excluded from regulation under the program. The Coalition also agrees with the exclusion of certain man-made wetlands and areas that are created as wetlands incidental to construction, mining and other activities. The Committee may wish to be open to other specific exclusions in this area. In addition, *the Coalition recommends* that the reported legislation clarify that "isolated wetlands" are only subject to the jurisdiction of the program if these wetlands are shown actually to affect interstate commerce, such as through their use as habitat by migratory birds. It would appear that the current EPA interpretation of its jurisdiction extends to any waters that "could affect" in interstate commerce, including use as a habitat for migratory birds.

ACTIVITIES REGULATED:

The second element that establishes the jurisdiction of the program is the definition of regulated activities. The Coalition agrees with the provisions of both S. 1304 and the President's plan that expand the activities to be regulated to include "drainage, excavation, ditching, channelization and mechanized landclearing." The Coalition believes that the appropriate mechanism for achieving this expansion of the program is legislative rather than regulatory. The Coalition also agrees that certain ditching and drainage activities should be excluded from regulation under the program, as is reflected in both S. 1304 and the President's program.

SEQUENCING, CATEGORIZATION AND RESTORATION:

In the view of the Coalition, the application of these three concepts holds the key to transforming the current Federal wetlands regulatory program from a program that antagonizes and alienates the owners of wetlands to a program that will earn their cooperation in a common effort with government to conserve, restore and enhance our nation's wetlands resources. While S. 1304 and the President's plan make strides in this area, we believe that both fall short of making the modifications necessary to resolve fully the current difficulties with the program.

SEQUENCING:

Sequencing is the methodology by which the Corps and the EPA determine whether a section 404 permit should be issued for a proposed activity. This methodology has its roots in the Section 404(b)(1) guidelines that were issued by the EPA on December 24, 1980, but became the methodology used by both agencies with the signing of the February 6, 1990 "Memorandum of Agreement Between the Environmental Protection Agency and the Department of the Army Concerning the Determination of Mitigation under the Clean Water Act Section 404(b)(1) Guidelines." This agreement was neither directed by Congress nor the subject of notice and opportunity for public comment. Prior to this agreement, the Corps judged applications under the traditional "public interest" balancing test contained in its section 404 regulations.

The sequencing methodology requires that the applicant show that there is no "practicable alternative" to the proposed activity that would have less adverse environmental impact. This is known as the *avoidance* step. Only if the applicant can make this showing can the applicant then proceed to the second step—the *minimization* step—where the application is reviewed to determine how environmental impacts can be minimized. Finally, in the *mitigation* step, the applicant must agree to provide compensatory mitigation for any remaining unavoidable environmental impacts of the activity. But mitigation opportunities cannot be considered until the first and second steps—*avoidance* and *minimization*—have been cleared. Under the Corps "public interest test," a comprehensive, integrated review of the permit application was made, including the potential for mitigation.

In practice, the *avoidance* step has become dominant, with applicants often being made to prove a long list of negatives in order to satisfy this first step. Such showings include: no alternative site is available; there are no alternatives to the activity that is being proposed; and so forth. In recent years, field officers of the Corps and the EPA have often been quite rigid in their application of this test and permit applications have often gone into a long holding pattern at this first stage. Obviously, a regulatory program that attempts to *avoid* economic activity on private property inevitably clashes with the rights of private landowners and creates the specter of "takings" by governmental action. This clash between private property rights and the Federal wetlands regulatory system will not cease until some flexibility is introduced into the *sequencing* methodology.

The Baucus/Chafee bill does not address this issue directly. The President's plan includes "guidance" that was recently issued to the field personnel of the Corps and the EPA instructing them that the sequencing test includes flexibility to adjust the rigidity of the test based on the impacts of the proposed activity and the functions and values of the wetland in question. The Coalition appreciates that the President's plan addresses this fundamental issue. However, the Coalition believes that the issue is too important to be resolved through a guidance document that can be withdrawn as easily as it is issued. *The Coalition recommends* that the Congress address this issue, provide policy guidance regarding flexibility in its permit approval methodology and direct that the *sequencing* methodology may only be used in high value wetlands.

CATEGORIZATION:

The Coalition believes very strongly that all wetlands do not provide: equal quantity or quality of wetlands functions and values. Yet, the current Federal regulatory program essentially treats all wetlands equally. Both the Baucus/Chafee bill and the President's plan endorse the concept of categorizing wetlands, but in a manner that we fear will be insufficient to resolve the current difficulties with the Federal program.

We have advocated a national categorization system in which wetlands are placed in at least three categories based on their relative functions and values. The highest valued wetlands would be regulated on a very rigid basis, perhaps through the *sequencing* methodology, while the lower categories of wetlands would be regulated more flexibly. The Baucus/Chafee bill provides for categorization and flexibility in regulatory treatment as part of the proposed state watershed and wetlands management plans. The President's plan makes a similar recommendation, but also specifically rejects the national categorization system as administratively infeasible and too expensive.

The members of the Coalition believe that the concept of state watershed and wetlands management plans provide significant promise and may be very effective tools for making wetlands regulatory programs responsive to regional differences. However, there is no certainty that states will be able to undertake such programs, despite the incentives in both S. 1304 and the President's plan. Also, there is no certainty that the Federal government will approve the plans that are developed by the states. Meanwhile, at least in those areas without such state plans, the section 404 program will not adjust the rigidity of its regulatory program to the levels of functions and values of the wetlands—an idea the merits of which both S. 1304 and the President's plan seem to acknowledge.

The members of our Coalition have trouble accepting the notion that the government cannot map and categorize the nation's one hundred million acres of wetlands—particularly at a time when the government is attempting to "reinvent" itself as a more user-friendly institution—an when the government appears to be ready to undertake a mapping exercise of the biological diversity of the *entire* nation through the National Biological Survey. In fact, we understand that the National Biological Survey is scheduled to commence October 1, 1993, without authorization of Congress and that the House has appropriated \$163.6 million for the Survey and the Senate has appropriated \$159 million. Perhaps the same resources that are undertaking the mapping of biological diversity could, at the same time, categorize and map the nation's wetlands. A report in the September 13th edition of *Inside Energy/with Federal Lands* suggests that an immediate focus of the Survey will be the completion of the national wetlands inventory that is ongoing by the Fish and Wildlife Service.

RESTORATION:

Finally, the Coalition is pleased that both S. 1304 and the President's plan recognize the importance of *restoration* of our nation's wetlands resources as a goal of the

Federal regulatory program. In both coastal and inland wetlands, restoration is a primary need. Restoration holds the key to attaining the long-term goal of enhancing our nation's wetlands resource base and, if applied judiciously, may hold the key to achieving the needed flexibility in the current regulatory program.

The Coalition recommends that Congress take the next step from both S. 1304 and the President's plan and adopt a nationwide categorization system for wetlands. The rigid sequencing methodology might be appropriate for the highest valued wetlands, but a less rigid permitting methodology should be adopted for moderate and lower valued wetlands. In these wetlands a permitting methodology should be established that retains the right to deny a permit, coupled with greater reliance on modifying proposed projects to minimize wetlands impacts and greater use of compensatory mitigation. This formula should achieve the twin goals of conserving and enhancing our nation's wetlands resource base while reducing the tension between private property rights and our nation's environmental goals.

MITIGATION BANKING:

The members of the Coalition are pleased that both S. 1304 and the President's plan recognize the contribution that *mitigation banking* can make to the Federal wetlands regulatory program. This concept, coupled with categorization and a more flexible permitting methodology in appropriate wetlands areas, provides an important instrument for restoring and enhancing wetlands functions and values on a watershed and ecosystem basis.

The Baucus/Chafee legislation, S. 1304, limits mitigation banking to restoration projects. The President's plan allows mitigation banking for restoration, enhancement, creation and, in limited circumstances, preservation of wetlands. The Coalition supports the broader application of the President's plan, although our members fully expect the vast majority of mitigation banking projects to be restoration and enhancement projects. The mining industry, in particular, can create wetlands at reclaimed mine sites. Mining companies have received environmental awards for such activities. These and other creation activities should be recognized and should be able to qualify as mitigation banks.

The members of our Coalition believe that both S. 1304 and the President's plan should be expanded to allow mitigation banks to be established *contemporaneously* with the activity for which they will provide compensatory mitigation rather than only *in advance* of such activities. We recognize that some have concerns that compensatory mitigation has not always been provided, even when promised or ordered by the Corps of Engineers. However, a better answer to this problem, we believe, is through inspection and enforcement, rather than rigidly requiring that all mitigation banks be developed in advance of the activities for which they will provide compensatory mitigation.

Unless the government intends to finance all banks, which we would hope is not the case, the incentive for a private sector bank to be established may not always exist "in advance." However, when a project is contemplated and undertaken, the incentive will be present and a bank can be developed with appropriate terms and conditions to ensure that the bank provides the required compensatory mitigation.

ADMINISTRATION OF THE PROGRAM:

The members of the Coalition are pleased that both S. 1304 and the President's plan address a number of problems with the administration of the current program.

AGENCY COORDINATION:

The members of the Coalition agree with the increased coordination of the activities of the various agencies contained in both S. 1304 and the President's plan. The Coalition appreciates the provision of S. 1304 that places a time limit on the exercise of the Section 404(c) veto power by the Environmental Protection Agency. However, *the Coalition recommends* that the Congress take one further step and repeal the Section 404(c) veto power of the Environmental Protection Agency.

The Environmental Protection Agency has a strong voice in the program through the Section 404(b)(1) guidelines. Provisions of the President's program and S. 1304 clarify the power of the Environmental Protection Agency with respect to various aspects of the program. The Section 404(g) elevation provisions, which allow the EPA, the Fish and Wildlife Service and the National Marine Fisheries Service to elevate policy decisions and permit decisions to their headquarters offices, exert significant "veto" type pressure on the Corps in its implementation of the section 404 program. The entire emphasis of the President's program and S. 1304 is to provide more guidance to applicants on the "front end" of the regulatory process in order to expedite the process and avoid the regulatory morass in which so many have found

themselves. In light of these developments and the evolution of the section 404 program over the last twenty years, the Coalition suggests that the Section 404(c) veto power is no longer necessary to ensure the voice of the EPA in the section 404 regulatory process. In line with the effort to "reinvent" and streamline government, the Coalition suggests that this unique mechanism be removed from the statute.

ADMINISTRATIVE APPEAL PROCESS:

The members of the Coalition appreciate the fact that both S. 1304 and the President's plan provide for an administrative appeal process for the section 404 program.

The Coalition prefers the President's plan for two reasons. First, the President's plan provides more grounds for appeal, including the accuracy of the determination that the area in question is a jurisdictional wetland and the imposition of administrative penalties. Second, the President's plan restricts the right of appeal to the permit applicant, but allows third parties to participate in the appeal when the permit applicant appeals the denial of a permit.

The Coalition believes that the President's approach of denying the right of third parties to initiate appeals in most instances is appropriate because a variety of Federal agencies participate in the permitting process to advocate the interests of the public.

The Coalition commends that the right of appeal in the President's plan be expanded further to include the appeal of permit conditions. While relatively few permits are completely denied, often permit applicants obtain permits that contain terms and conditions that render the permits useless. The Coalition believes that the permit applicant should have access to the administrative appeal process for terms and conditions, but would further recommend that third parties be allowed to participate in such appeals as they may participate in appeals of permit denials.

DEADLINES FOR ACTION ON PERMIT APPLICATION:

The members of the Coalition appreciate that both S. 1304 and the President's plan address the issue of deadlines for action on permit applications. Unfortunately, neither the bill nor the plan provide a mechanism that will enforce the time deadlines. *The Coalition recommends* that the Congress provide that any permit application that is not acted upon within the time deadlines shall be construed to have been issued with the terms and conditions contained in the application. The Corps could be given the authority to certify that one of the grounds contained in S. 1304 for failing to act has occurred, but the Corps should be required in that instance to establish a new and reasonable deadline for action.

GENERAL PERMITS:

The Coalition appreciates that both S. 1304 and the President's plan recognized the importance of general permits to the implementation of the section 404 program and have, if anything, expanded their use. The Coalition is somewhat concerned, however, with that provision of S. 1304 which may be read to add to all current general permits requirements to mitigate adverse impacts. General permits, by definition, have only "minimal" impacts, both individually and cumulatively, and the Coalition is concerned that mandating new mitigation conditions is unnecessary and may reduce the usefulness of general permits.

MAPPING AND NOTICE:

One of the difficulties of the current program is that no maps exist indicating which lands are subject to Federal regulation and that no notice is provided at county and parish courthouses where prospective land purchasers or lenders can be notified of the Federal status of certain lands. While the section 404 program resembles a Federal zoning program, it does not contain the mapping and notice protection of a typical zoning program. Neither S. 1304 nor the President's plan address this program deficiency. *The Coalition recommends* that Congress direct the mapping of Federal wetlands and the posting of such maps in county and parish courthouses to notify the public of the potential Federal status of county and parish lands.

ROLE OF THE STATES AND LOCAL GOVERNMENTS:

The members of the Coalition are pleased that both S. 1304 and the President's plan attempt to harmonize and coordinate local, state and Federal actions on wetlands through the traditional state assumption approach, the use of programmatic general permits and the innovative state wetlands and watershed management plans. These approaches appear to offer great promise for better and more efficient

environmental regulation *if* states and localities will determine to take advantage of these opportunities and *if* the Federal government is flexible in its plan approval process.

The Coalition recommends that Congress provide, with respect to each of these approaches, that the Corps and the EPA do not retain the ability to review individual permit decisions within the limits of any such approved plans. Compliance with an approved state program to which the section 404 program has been delegated, compliance with an approved state watershed and wetlands management plan, and compliance with a programmatic general permit should be deemed to be compliance with the section 404 permitting program. The members of the Coalition believe that the proper role of the Federal agencies is to approve such plans, then to monitor the progress of such plans and to revoke the plans, after notice and hearing opportunities, if they are not working properly.

The Coalition also recommends that the rules concerning the establishment and approval of state watershed and wetlands management plans, in particular, be carefully constructed to avoid undue burdens for interstate projects. A proliferation of watershed management plans may pose significant difficulties for interstate pipeline and electricity transmission projects, particularly where the "host" area does not benefit directly from the project, although the project may be very important to either the nation or a region. Will the general permits of the section 404 program apply in such approved plans? Will such plans be approved if they contain provisions aimed at denying permits to certain types of interstate activities?

Finally, while the Coalition recognizes the interest in encouraging states to implement state watershed and wetlands management plans, the provision in S. 1304 that withdraws programmatic general permits if state watershed and wetlands management plans are not in place on December 31, 1996, may be counter productive. In a progressive and effective local wetlands management plan has received a programmatic general permit, but the watershed area in which the local plan is located has not developed an approved watershed management plan in a timely fashion, repealing the programmatic general permit may advance neither environmental interests nor local governmental and economic interests. Moreover, those involved in developing the local plan may be completely powerless to effect the development of an approved watershed management plan covering the larger area.

PRIVATE PROPERTY RIGHTS:

One of the major reasons that the Congress is now preparing to address the section 404 program is that thousands of landowners around the nation have complained to their elected representatives that the Federal wetlands regulatory program is denying them the use and value of their property. Local tax bases have suffered as landowners have sought and obtained lower tax assessments on their "wetland" properties.

Many of the provisions of S. 1304 and the President's plan, if implemented properly, should reduce the conflict between private landowners and the Federal program. The second principle of the President's plan states that the section 404 program must be:

"administered in a manner that avoids unnecessary impacts upon private property and the regulated public, and minimizes those effects that cannot be avoided. . . ."

A later provision of the President's plan states that:

"The Administration strongly supports private property rights. . . . However, in rare instances the public interest in conserving wetlands may substantially interfere with the rights of landowners. In such instances, Federal action will be based on the proposition that restrictions on the actions of the property owners in question are called for in order to protect the property rights, safety, environmental or economic interests of other individuals or the community at large. In those situations where the necessary restrictions on use amount to a taking of the property, the owner will, of course, be entitled to compensation."

Unfortunately, the Administration plan is silent on exactly how such a citizen will obtain compensation, other than bringing an action against the Federal government in the Court of Federal Claims for compensation pursuant to the Fifth Amendment to the United States Constitution.

The members of the Coalition believe that the harsh reality is that "takings" in commonly understood terms may not be so rare, while "takings" in the judicial sense may be rare indeed. If the only mechanism for obtaining compensation from the government for the lost use of private property under the section 404 program is to sue the government, few Americans will be able to obtain relief. Suits against the

Federal government alleging a "taking" generally require the investment of years and hundreds of thousands of dollars, which can be repaid by the government if the plaintiff is successful. Only the wealthiest individual Americans and successful corporations can afford such suits.

The Coalition recommends that Congress direct legislatively that the section 404 program be implemented in such a fashion as to the adverse impact on the use and value of private property. The Corps and the EPA should be required to monitor the adverse impacts on private property and local tax bases and to report to Congress every two years on this subject. *The Coalition recommends* further that the Congress should develop a non-judicial mechanism by which at least certain classes of wetlands owners can obtain compensation in appropriate cases without resort to court. Earlier this year, Secretary of the Interior Babbitt suggested to the House Merchant Marine and Fisheries Committee in oral testimony that the Land and Water Conservation Fund might be used for this purpose.

INTERGOVERNMENTAL WETLANDS COORDINATING COMMITTEE:

S. 1304 calls for the establishment of an "intergovernmental wetlands coordinating committee" to coordinate Federal, state and local government wetlands policies. The Coalition notices that the bill makes no provision for membership on the coordinating committee by representatives of wetlands owners. The Coalition believes that since a vast majority of wetlands are in private ownership, and such ownership is a complicating factor in creating a workable Federal wetlands policy, any coordinating committee should include the regulated community, including representatives of private landowners.

AGRICULTURE:

The Coalition is pleased with the progress that both S. 1304 and the President's plan make with respect to the equitable and efficient treatment of agriculture, particularly where farming and agricultural activities are involved. While several agricultural interests are represented in the Coalition, we understand that members of the agriculture community will be testifying before the Subcommittee. Therefore, we will not presume to speak for agriculture on these matters.

ALASKA:

The Coalition is disappointed that neither S. 1304 nor the President's plan address specifically the very special problem that Alaska is experiencing under the section 404 program. We are pleased that the Administration has promised to address this issue and encourage the Members of the Subcommittee to include in the Clean Water Act Reauthorization legislation specific provisions that address the very legitimate concerns of Alaska. We understand that Senator Stevens will be testifying before the Subcommittee on these matters. We support the Alaska delegation and our Alaska members in their efforts to obtain a workable and effective program for their unique circumstances.

CONCLUSION:

Mr. Chairman, thank you again for giving the Coalition an opportunity to testify today and for addressing the Federal wetlands regulatory program. We look forward to playing a constructive role in the effort to achieve a balanced and effective Federal wetlands regulatory program that works for the environment, the nation's economy and private landowners.

Thank you.

STATEMENT OF PRINCIPLES

The National Wetlands Coalition is a geographically and economically diverse group of public and private sector entities that have joined together to participate in the efforts of the Congress and the Administration to establish a comprehensive policy for effective conservation and management of the Nation's wetlands. The National Wetlands Coalition will support the adoption of the specific programs and policies that advance the objectives of wetlands conservation, consistent with the following principles:

1. The Congress of the United States and the President should establish a comprehensive Federal Program for managing the Nation's Wetlands Resource Base in a manner that effectively and sensibly accommodates the competing, legitimate demands for conservation and use of wetlands resources.

2. Given the number and diversity of people affected, and the economic and environmental importance of the Wetlands Resource Base, a comprehensive Federal Wetlands Policy should be the product of a National consensus-building process.
3. "No overall net loss of wetlands values" is an appropriate goal for achieving the effective conservation of significant wetlands values and functions. This goal should be pursued by implementation of a variety of the regulatory and nonregulatory programs designed to: conserve the highest value wetlands; ensure that development activities in wetlands conserve wetlands values and functions to the maximum extent practicable; eliminate or streamline procedures for use of wetlands of marginal resource value; and, provide incentives for private wetlands conservation efforts.
4. Protection of the Nation's high-value wetlands, and restoration of wetlands generally, will require aggressive nonregulatory programs including public acquisition and incentives for set-asides and for restoration activities. Federal funding required for such programs should be from the broadest sources possible with no single industry required to bear a disproportionate share of the cost.
5. Substantial reform of the section 404 permitting process is necessary to consolidate agency responsibility, to expedite routine permitting, to increase flexibility in the program, and to provide greater predictability in all cases. Critical to the establishment of a sensible permitting process is the recognition that all wetlands are not of equal value and that the level of regulation and mitigation imposed should vary depending upon functions and values of affected wetlands, degree and duration of impact, and the surrounding land use.

The National Wetlands Coalition is a geographically and economically diverse group of public and private sector entities that have joined together to participate in the efforts of the Congress and the Bush Administration to establish a comprehensive policy for effective conservation and management of the Nation's wetlands. The National Wetlands Coalition will support the adoption of specific programs and policies that advance the objectives of wetlands conservation, consistent with the following principles:

1. **THE CONGRESS OF THE UNITED STATES AND THE PRESIDENT SHOULD ESTABLISH A COMPREHENSIVE FEDERAL PROGRAM FOR MANAGING THE NATION'S WETLANDS RESOURCE BASE IN A MANNER THAT EFFECTIVELY AND SENSIBLY ACCOMMODATES THE COMPETING, LEGITIMATE DEMANDS FOR CONSERVATION AND USE OF WETLANDS RESOURCES.**
 - The National Wetlands Coalition recognizes that the Nation's wetlands are a dwindling and valuable natural resource that has been and should continue to be, host to a wide variety of environmental values and economic activity.
 - At the national, state and local levels, attempts have been made to devise regulatory and nonregulatory programs aimed at addressing specific wetlands resource management issues. The result is an inconsistent, often duplicative array of federal and state programs that do not effectively serve the purposes of better conservation and management. To ensure uniformity and minimize redundancy, the federal government should take the lead in defining a national policy for accommodating the competing needs for wetlands conservation and use, and for providing economic incentives for private wetlands conservation efforts.
 - In devising federal policies, programs and standards for wetlands conservation, policymakers should not view wetlands as an isolated resource. While a comprehensive wetlands policy by definition will give special focus to wetlands, conservation issues, federal policies governing the use of wetlands resources should also account for values and functions of neighboring upland and open water resources and the social benefits of man-made systems necessary to support and protect the human population.
2. **GIVEN THE NUMBER AND DIVERSITY OF PEOPLE AFFECTED, AND THE ECONOMIC AND ENVIRONMENTAL IMPORTANCE OF THE WETLANDS RESOURCE BASE, A COMPREHENSIVE FEDERAL WETLANDS POLICY SHOULD BE THE PRODUCT OF A NATIONAL CONSENSUS-BUILDING PROCESS.**
 - Most of the Nation's population lives and works in coastal areas or along rivers and other streams. As a consequence, policies dictating the management of this resource directly affect a substantial portion of the Nation.
 - Over seventy percent (70%) of the Nation's wetlands are privately owned. Consequently, it is unreasonable to expect a national wetlands policy to be effective unless it is the product of a national consensus.

- In order to accomplish this very broad goals of wetlands conservation, substantial resources (both public and private) will be required. In the absence of a nationwide consensus on a national wetlands policy, these programs will not receive the high national priority required to accomplish the national goal.
 - A number of administrative authorities are currently in place that enable the Army Corps of Engineers, the Environmental Protection Agency (EPA), and the Fish and Wildlife Service, to regulate activities in wetlands. However, the actions under these authorities have not in the past been well-coordinated and the public has not had an adequate opportunity to evaluate specific policies and procedures that may be used to accomplish the national wetlands conservation and management goals. To ensure adequate public participation in the development of federal policies and programs, it is essential that all administrative actions establishing new wetlands policy be subject to the Administrative Procedure Act notice and comment process.
 - The results of the interagency Task Force regional hearings should be the starting point for the development of a comprehensive wetlands conservation and management policy. In addition, the Congress should undertake a comprehensive review of the section 404 permitting process to evaluate the effectiveness of that program in meeting the goals of effective wetlands conservation management and use. Thereafter, if appropriate, the Congress should enact legislation establishing the statutory parameters of a national wetlands policy that takes into consideration the recommendations of the Task Force and the findings of the Congressional review of the permitting process.
3. "NO OVERALL NET LOSS OF WETLANDS VALUES" IS AN APPROPRIATE GOAL FOR ACHIEVING THE EFFECTIVE CONSERVATION OF SIGNIFICANT WETLANDS VALUES AND FUNCTIONS. THIS GOAL SHOULD BE PURSUED BY IMPLEMENTATION OF A VARIETY OF REGULATORY AND NONREGULATORY PROGRAMS DESIGNED TO: CONSERVE THE HIGHEST VALUE WETLANDS; ENSURE THAT DEVELOPMENT ACTIVITIES IN WETLANDS CONSERVE WETLANDS VALUES AND FUNCTIONS TO THE MAXIMUM EXTENT PRACTICABLE; ELIMINATE OR STREAMLINE PROCEDURES FOR USE OF WETLANDS OF MARGINAL RESOURCE VALUE; AND, PROVIDE INCENTIVES FOR PRIVATE WETLANDS CONSERVATION EFFORTS.
- National wetlands policy should be forged around the following critical assumptions, which derive from the recognition that the functional values associated with different kinds of wetlands may vary substantially:
 - i. There are some areas of wetlands that possess unique, fragile and scarce environmental values that are so exceptional and significant that preservation of these lands in their natural condition will be desired by federal, state and local governments and by the public. In those cases, the land should be purchased or set aside rather than preserved solely through regulation. Those wetlands should be identified in an open public process. Once so identified these lands should be promptly acquired and set aside, with fair compensation to the landowner. If acquisition or set aside is not tenable within a reasonable period of time, these lands should be made available for other uses, consistent with appropriate environmental safeguards.
 - ii. Much of the Nation's wetlands resource can sustain multiple use, subject to appropriate environmental regulation. Such areas may include certain publicly owned wetlands not managed under protected status. Even where significant environmental values are present, multiple use may be appropriate where such uses provide social and economic benefit and where environmentally sound management techniques are available that minimize or adequately compensate for values lost.
 - iii. The stringency of environmental regulation should vary depending upon such factors as the functional values affected, the character of the intrusion (temporary or permanent), and the reliability of conservation technologies. Emphasis should be placed upon protection of values or compensation for functions lost. Requirements for compensation should vary in relation to the duration of impact on environmental values, the extent of loss of functional values, the relative abundance of remaining wetland values in the affected area, and the cost-effectiveness of compensatory mitigation.
 - iv. Areas that fall within the technical scientific definition of wetlands, but which offer not appreciable functional resource values, should be exempt from federal permitting regulation. Requirements for compensatory mitigation may not always be appropriate in areas where wetlands are in abundance and losses

are minimal. Where wetlands values are limited or marginal, streamlined procedures should apply.

- v. Some areas of degraded wetlands may be made available for set aside voluntarily by landowners or developers as mitigation for other activities, if such areas have potential as sites for restoration or enhancement.
 - vi. In addition to wetlands-related environmental considerations, other critical factors to be considered in effectively managing wetlands resources are: social benefits to be derived from multiple use; impact of wetlands planning decision on other environmental values; the feasibility of mitigation techniques that minimize intrusion resulting from specific uses; the availability and feasibility of compensatory mitigation; and the relative benefits and costs of eliminating economic activities in privately owned wetlands.
 - The phrase "no net loss" of wetlands has become a watchword for the current wetlands policy debate. However, the phrase as yet has no workable definition. If the concept is to have a constructive place in the national policy debate, it must be defined as an overall goal, the purpose of which is to conserve existing wetlands values, to restore and enhance degraded wetlands areas, and to develop reliable techniques for creating wetlands values.
 - The "no net loss" of wetlands goal should not be implemented as an arithmetic standard to be applied through regulatory programs and measured by comparing acreage losses and gains on a permit-by-permit basis. Success in accomplishing the "no net loss" goal should be measured by evaluating the values and functions preserved and gained through regulatory and nonregulatory programs that minimize or compensate for the adverse effects of development activities. Also critical to success is the development of programs that add to the wetlands resource base through acquisition and improved wetlands restoration, enhancement and creation techniques. The National Wetlands Coalition supports the pursuit of this goal.
- 4. PROTECTION OF THE NATION'S HIGH-VALUE WETLANDS, AND RESTORATION OF WETLANDS GENERALLY, WILL REQUIRE AGGRESSIVE NONREGULATORY PROGRAMS INCLUDING PUBLIC ACQUISITION AND INCENTIVES FOR SET-ASIDES AND FOR RESTORATION ACTIVITIES. FEDERAL FUNDING REQUIRED FOR SUCH PROGRAMS SHOULD BE FROM THE BROADEST SOURCES POSSIBLE WITH NO SINGLE INDUSTRY REQUIRED TO BEAR A DISPROPORTIONATE SHARE OF THE COST.**
- In areas where no development is to be permitted, land must be acquired and owners fairly compensated. A trust fund may be necessary to make this acquisition a national priority. Legislative action may also be necessary to facilitate land or resource exchanges as a method of compensation.
 - As a supplement to programs for acquiring highest value wetlands, tax incentives for easements, donations or other set-aside programs should be increased.
 - The management of governmentally owned resources should be evaluated. In some instances, increased levels of protection of governmentally owned lands and additional investment in resource enhancement may be appropriate. In the case of governmentally owned lands that can sustain multiple use, appropriate regulatory programs should be established that take into account environmental values and functions as well as social factors including energy security needs and economically effective resource management.
 - Subsidy programs that encourage destruction of wetlands should be reconsidered or eliminated, as appropriate.
 - Research and development efforts should be aggressively undertaken and funds, both public and private, should be made available for planning, restoration projects, and related wetlands conservation activities.
 - In recognition of the fact that all Americans benefit from the developmental activities taking place in the Nation's wetlands, federal funding required for programs implemented as a result of a national wetlands policy or new legislation should come from the broadest sources possible. No distinct group of Americans or single industry should bear a disproportionate share of the cost.
- 5. SUBSTANTIAL REFORM OF THE SECTION 404 PERMITTING PROCESS IS NECESSARY TO CONSOLIDATE AGENCY RESPONSIBILITY, TO EXPEDITE ROUTINE PERMITTING, TO INCREASE FLEXIBILITY IN THE PROGRAM, AND TO PROVIDE GREATER PREDICTABILITY IN ALL CASES. CRITICAL TO THE ESTABLISHMENT OF A SENSIBLE PERMITTING PROCESS IS THE RECOGNITION THAT ALL WETLANDS ARE NOT OF EQUAL VALUE AND THAT THE LEVEL OF REGULATION AND MITIGATION IMPOSED SHOULD VARY DEPENDING UPON FUNCTIONS AND VALUES OF**

AFFECTED WETLANDS, DEGREE AND DURATION OF IMPACT, AND THE SURROUNDING LAND USE.

- In the short term, specific regulatory reforms should be implemented to ensure a more effective, equitable and predictable regulatory system. These reforms should be developed in accordance with the following guidelines:
 - i. In any case in which compensatory mitigation is appropriate, compensatory mitigation requirements should be considered early in the section 404 permitting process. This is particularly important where compensatory mitigation is required by consulting agencies or nonfederal agencies.
 - ii. Mitigation that is demonstrated to be effective should be relevant to all phases of alternatives comparisons.
 - iii. The leadership role of the United States Army Corps of Engineers in the section 404 permitting process should be clarified and the role of other federal agencies in the process should be consolidated. In particular, the EPA's role in specific permit decisions should be limited. To the extent that the EPA should continue to play a role in specific permitting decisions, the EPA should be required to participate in the early stages of any standard permit process as a precondition to the exercise of the section 404(c) veto. If the EPA's veto power is retained, the basis for exercising the veto should be specifically identified.
 - iv. The permit process should give reasonable deference to the applicant in defining a project's purpose. This is particularly important for public works projects undertaken by state and local governments. In the event such a proposed project does not meet section 404 requirements, the federal permitting agency should be required to work with the applicant to identify a permissible project alternative that substantially accomplishes the applicant's project purpose and which can receive permit approval as part of the pending permit process.
 - v. Where regulatory mitigation is required, such requirements should be flexible enough to encourage private sector investment and innovation in wetlands enhancement, restoration and creation.
 - vi. The "public interest" standard should be statutorily integrated into the section 404 permitting process.
 - vii. It may be appropriate for certain activities that are currently nonjurisdictional to be integrated into a new federal wetlands regulatory program.
 - viii. Nationwide, permits should be maintained; certain regulatory nationwide permits should be statutorily affirmed.
 - ix. Federal mitigation policy must be committed to the conservation, enhancement, restoration and creation of wetlands on an ecosystem basis. A federally supported mitigation banking program should be established for states or, where appropriate, localities, for the purpose of coordinating mitigation activities in wetlands ecosystems.
- Over the longer term, a regulatory program should be developed that assigns different levels of regulatory requirements commensurate with the character of the wetlands values affected by proposed activity. As a result, the cornerstone of regulatory revisions to the section 404 process should be a nationwide effort that will evaluate and categorize wetlands according to their functions and values.
- The characterization of wetlands for regulatory purposes should take into consideration economic, social, and environmental considerations, as well as the established surrounding land use.
- To avoid transfer of an essentially local land use function to the federal government, states should play a major role in defining this scheme for designated wetlands values, functions and uses.
- In general, wetlands that are incidentally created by development activity are unlikely to possess high ecological values and should be treated with maximum regulatory flexibility.
- The consequence of this characterization for purposes of managing uses should be as follows:
 - i. Some areas will be determined by legislative action to be appropriate for acquisition. These areas may include for example, those that contain very high values that would be destroyed if permanent development activity were permitted to occur therein. Funding should be available so that landowners will be fairly and timely compensated for the taking of such wetlands.
 - ii. Other wetlands areas will be identified as environmentally sensitive, although capable of sustaining certain kinds of development activities. These should be

- subject to more rigorous environmental requirements, including the development of higher standards of industry practices where appropriate.
- iii. Some areas will be identified as having only marginal resource values. Regulation of activities in such areas should be streamlined and, if possible, eliminated. Areas with minimal wetlands characteristics, but that provide marginal environmental values, should be exempt from regulation.
